THE BUILDING NEWS

AND ENGINEERING JOURNAL.

MODERN BUILDING SITES.

[F a building often makes a site, it is equally true that a site often rules the plan nd appearance of a building. When build-ng-land in the great cities reaches such abulous prices as it often does, architects ıave little choice left them in the deter-nination of the kind of structure which hould be put on the land. Whereas, for-nerly, important buildings could be placed n areas of any size, independent of any estrictions, it is now obvious that the shape nd surroundings of the site have to be tudied to the best advantage. We have nstances of these conditions in several parts f London that have been recently built ıpon. The influence of site has been very orcibly shown in the large hotels and club-ıouses erected in the Northumberland-ıvenue. By the convergence of that ıvenue with Whitehall-place, we have three riangular or trapezoidal-shaped plots which ıave called for an architectural arrange-nent quite or almost unknown to the archi-ects of a former era. The Hôtel Métropole ıas a particularly acute and unpleasing-ooking corner towards the Embankment, ınd the same difficulty has been encountered, ut far more successfully, by the tower termination of the National Liberal Club-house at the adjoining corner. The Con-stitutional Club-house stands on a triangular-shaped site, and here, also, the architect, Mr. R. W. Edis, F.S.A., has successfully grappled with the eastern angle. Opposite, the Hotel Victoria is fitted to a plot of ground that re-quired considerable ingenuity in the planning, though the frontage was plain sailing. More mportant, as it regards architectural arrange-ment, is the site in the rear of the National Gallery, for which a plan has been sug-gested by the Royal Institute of British Architects. As our Metropolitan readers are ıware, at present the street improvements at the back of the Gallery have created a very awkward plot of ground. The new thorough-fare is abruptly terminated in view of the rearward portion of the gallery, which is any-thing but agreeable, and, as we have pointed out, cuts very disagreeably the outline of St. Martin's Church. The remaining portion of site at the back of the gallery can only be usefully applied to the extension of that building. Then the irregular plots of land between the Charing Cross-road and St. Martin's-lane present formidable problems to the architect. The same perversity of cir-cumstances is to be found in the newly left sites on the east of Piccadilly-circus (where the London Pavilion has been built on a triangular plot made by the new Shaftesbury-avenue) and at the northern end of that new road where it enters Oxford-street. The properties are cut obliquely, leaving some intractable and unmanageable plots for dealing with.

One feature has arisen from the modern irregular or triangular site—it is the treat-ment of corners. So long as the plots were rectangular, or large building areas were to be obtained, the corner never obtruded itself; now it is a very common feature, and can no longer be disregarded; an acute corner cannot be architecturally managed like a square corner. To cut or cant it off, or round it, is unsatisfactory, so that the architect is obliged to emphasise it in some manner, either by a tower or turret. In the United States the corner tower, often circular, finished by a conical roof, is a common feature; we see it growing as it were out of the roof, where it presents a problem of interpenetration of the cylindrical or conical and inclined roof surfaces, though there it is less the offspring of neces-sity, the right-angled plan of arrange-ment being common in American towns. The hexagonal tower, or the circular oriel projecting beyond the walls, is also applied to obviate the unpleasant effect of sharp angles. The sharpness of the receding lines of the frontages which have an acute angle has never favoured monumental effects. For purely Classic structures the corner is fatal, though in the freer treatment of the style it admits of satisfactory management. The angle tower to Mr. Waterhouse's club-house in the Northumberland-avenue is at once a redeeming feature, and is a good example of the only artistic mode of finish open to the architect. A want of balance is generally one of the disadvantages of empha-sising the end of a building in a Classic design.

There is another peculiarity which distin-guishes the contracted site. It is the "draw-ing up" of the building. The necessity for utilising the area demands additional stories and increased elevation. By multiplying the stories, the architect loses that breadth of base required to give dignity to a design. The hori-zontal division and repetition of floors are among the bugbears of city architects. How they can obtain variety in fenestration and suf-ficiency of light are important questions. We can refer to several corner buildings in which superposition has taxed the designer's re-sources severely. Near St. Clement Danes, on the west side of the Courts of Justice, is a new brick and stone block of offices which has been carried up under these trying con-ditions; but owing to the projection of the building beyond the line of the Courts, the architect has obtained a lofty corner elevation gabled, which can be seen up Fleet-street for a considerable distance. There are other negative qualities which detract from the architecture of contracted areas. One of these is the want of play in the outline of plan. The façades have to be brought close to the boundaries, leaving little opportunity for projections and recessed parts. A break forward here and there gives the architect scope for breadth of light and shadow; without them his only resource is treatment by relief and colour. Balance also is impossible when the elevation is flat and narrow, even skyline can only be purchased by costly roofing, dormers, and features on the outer plane of the façade. One can hardly conceive the architect under worse conditions than that of having to design a building for a corner site jammed between two adjacent properties, and without means for lighting the two inner sides except it be one with two fronts meet-ing at an acute angle; the latter is certainly the more discouraging of these difficult problems.

The prices now realised for building sites in the City are alone almost prohibitive of good architecture. The other day a site in St. Swithin's-lane was offered for letting on building lease by Messrs. Debenham, Tewson, Farmer, and Co., which contained an area of 2,036ft., and a frontage to St. Swithin's-lane of 63ft. 7in., and another in Salters' Hall Court in the rear. The term for letting was for eighty years. The price realised represented a rental of 11s. per square foot. In the heart of the City land has been sold for £20 to £30 per superficial foot. Where ground-rents are so enormous, sites for building become more and more pinched, and the cost of erection adds to an expenditure which, in many cases, is a severe tax on the lessee, if his profits or incoming rent are indeed sufficient to meet the "outgoings." The site, therefore, has fettered the architect, and will, it is probable, still more call into requisition his inventive powers in the future, to meet the varied demands of the law and the requirements of employers. Contrivance of plan under other restrictions, as, for example, the legal deci-sion that makes it possible for a corner house to be in two streets, and the obstruction of light, is enough certainly to require the exercise of no small amount of skill and patience. In-stead of adapting the site to the building, we have now to adapt the building to the site. Developing a plan is now only an exceptional possibility, and happy is the architect who has an unrestricted area to work upon, un-confined by adjacent buildings and streets, who can without hindrance extend his façades in any direction he pleases, place his entrances in convenient positions, and throw out wings laterally or rearward without interfering with his foreground and quadrangles. There are many new City sites which scarcely give room enough to the spectator to obtain a view of the building. In Fetter-lane one has to look at Messrs. Sampson Low and Marston's new premises near the Record Office from an opposite court, and we could mention other instances of new buildings erected in positions which require a considerable turn of the neck to examine. The usual angle they subtend is too great for a convenient view, and they may be compared to large pictures in rooms which

do not offer for their inspection any fair point of sight. Architecture under such circumstances is all but thrown away in thoroughfares which offer very small chance of ever being widened.

MARBLE AND MARBLE WORKERS.—X.

By ARTHUR LEE.

AMERICAN MARBLES.

AT North Adams, Massachussetts, there is a quarry of white marble, coarsely crystalline. Blocks were formerly produced from this quarry; but it is now almost entirely worked for stone, which is ground up and sold for marble dust.

Further south, at Lee, extensive quarrying operations are carried on. From the quarries in this neighbourhood the material was supplied for the extension of the Capitol at Washington, and the City Hall at Philadelphia. In the building of the latter, 702,000 cubic feet were used, some of the blocks being of very large size, and weighing singly over 20 tons.

The town of Sheffield formerly produced a white marble which at one time enjoyed considerable reputation in consequence of the very large size of the blocks in which it could be obtained. The large columns of the Girard College, Philadelphia, are of this marble, which with great labour was carted across the hills to the Hudson river, whence it was shipped to Philadelphia. The quarries have not been worked for some time.

Abandoned workings are also to be found at Canaan and Marbledale. At Marbledale, the first sawmill erected in the States was built by Philo Tomlinson, about the year 1800. He used soft iron toothless saws stretched on a frame forming a gang. The gangs were driven by water-power, and the saws were fed with sand and water equally distributed by an automatic arrangement, for which a patent was granted to him. For many years the business was prosperous. In 1830 as many as fifteen quarries were actively worked, and a like number or more mills were in operation within a distance of three miles of the town. When, however, the Vermont marble came into the field with a better quality at a lower cost of production, the marble trade of Marbledale was doomed, and the workings were ultimately stopped. East Canaan furnished the marble for the new State House at Hartford. This marble is fairly white; but the quality is uncertain. It is not suitable for monumental purposes, but has been much used for building. At the sawmills which were erected at this place the saws were toothed with diamonds. The carbons were set in pieces of steel or iron, and these patches were brazed into the blade of the saw. It is stated that they were wonderfully effective, sawing the blocks of marble very rapidly.

At Dover, in New York State, quarries of white marble have been extensively worked. Dover marble is of fairly fine grain, but it does not take a high polish. Two coloured marbles are raised near Chazy and Plattsburg in Clinton county. They are known as "Lepanto" and "Frency grey." The former is composed of pink and red fossilised shells in a reddish ground. The latter is of similar character, but with a darker ground. Both these marbles have been much used for furniture and interior decoration.

The white marbles of Maryland will not compare in point of quality with those of Vermont, but considerable quantities are raised and used for building purposes. The principal quarries are situated near Cockeysville and Tescar in Baltimore county. A very large trade in marble is done at Baltimore, not only in the Maryland marbles, but also in that which is imported from other states and from Italy. Some of the finest buildings in the country are constructed of Maryland stone. The Washington monument and the platform and columns of the National Capitol are made of the white marble, and the Baltimore City Hall is built of it. This stone is very sound and compact in texture. It is capable of being quarried in very large sizes: blocks 28ft. by 10ft. by 3ft. have been raised.

At Point of Rocks there is a deposit of a very fina breccia known as "Calico" marble. It has been used in the construction of the columns of the old Hall of Representatives at the Capitol building in Washington.

Near Dublin, in Harford County, there are quarries of green serpentine, which have been largely developed during the last few years; and, in Frederick county, a marble very similar to Verd antique is exclusively worked.

The marble and granite quarries of Maryland employ about 850 men. The quarries are not so carefully worked as in Vermont. In some of them the drilling is done by machinery; but the principal part of the work is got through by manual labour. In the quarries near Baltimore, Italian and Negro labour is being introduced. The quarry hands work about nine months in the year. A foreman who superintends the drilling receives from 8s. to 10s. per day; drill hands, 6s.; labourers and teamsters, 5s.; coloured labourers can be obtained for about 4s. The town of Baltimore supplies most of the monumental work done in the State. The marble-cutters there work principally on imported Italian marble. The best of them receive from 10s. to 12s. per day. Expert carvers get 16s. Letter-cutters are mostly paid by the piece, the price being in accordance with the style of work. A good man can earn about 12s. per day. Rubbers and polishers get from 6s. to 8s. per day. The men work ten hours in summer, and from eight to nine hours in winter. Men engaged to set the stone on buildings get 13s. per day. This is the Union price. Most of the stone used in house building in Maryland is either cut in Baltimore and sent from there ready worked, or is cut on the building site by Baltimore hands.

Alabama possesses an excellent white marble known as "Talladega." There are also quarries in this State which produce a grey and white non-crystalline variety, and several variegated marbles.

At Marietta, in Pinches County, North-East Georgia, there are some extensive works which have been formed to operate upon the marble which is raised in that district. This country will be opened up by the construction of the Marietta and North Georgia Railway. The deposits of marble are of large extent. In one valley there is a solid mass 5,000ft. in length, and over 2,000ft. in width, and the beds are found to spread over a space of some 7,000 acres. The quarries now in work are four in number. The Kennesaw quarry produces a limited quantity of a pure white marble, but the bulk is of light ground slightly clouded with spots and dark veins, and is similar in appearance to Italian vein. The Creole quarry produces a marble with light ground and a finely-mottled surface, and another with a light blue and grey ground, and darker veins. The Cherokee quarry produces marble of a similar character, but the markings are rather less decided. The Etowah quarry produced a great variety of coloured marbles, pink, red, and dark green, and variegated in many shades of these colours. Georgia marble is said to be very sound, highly crystalline, and dense, and to be non-absorbent in a degree which few marbles can equal. This last quality is one which should make it very useful, if the cost of working is not too high. The marble can be obtained in large sizes, blocks weighing upwards of 25 tons having been raised.

Hawkins County, in Tennessee, produces a marble which varies in colour from light pink mottled with white through all shades to deep chocolate red. It is very close and compact in texture, with almost absolute freedom from flaws. It has been employed in the Capitol building at Washington, and is much in request for general decorative work.

A very fine fossil marble is found in the beds of Devonian limestone near Charles City, Iowa. The rock is hard and fairly sound; it is non-crystalline, and is full of fossil shells and corals. The colours are somewhat dull; they vary from light drab to dark brown. The surface takes a good polish and shows to advantage the fossil remains, sometimes 8in. and 10in. in diameter, which are imbedded in the matrix.

In Illinois, a stone known as "Lemonte marble" is extensively quarried; this has been largely used in the building of Chicago. Kansas possesses some very good black marbles, and one of a light cream colour, which is soft and easily worked.

In Swain County, North Carolina, near the junction of the two branches of the Western North Carolina Railroad, there is an extensive deposit of coloured marbles. Some of them are green, blue, and pink, some black and white; they are all capable of taking a high polish, and are very sound. These marbles have been lately used in the construction of the new Governor's house at Raleigh, N.C.

In the Rocky Mountains and all through the Pacific States marble is found in large quantities. In Colorado there are deposits of white, green, and clouded marbles, and of a very fine brecciated variety. California is especially well favoured in this respect. Nine miles north of Ione, in Amador County, there are quarries of white marble, which make an excellent building stone. In Calaveras County there is a deposit of a pearl-grey marble with dark markings, which takes a high polish. Near Newcastle, in Placer County, there is a large quarry of marble, which varies from pure white to grey, and which polishes well; the Folsom prison is entirely built with this stone. The quarry was opened in 1877, and has been extensively worked. A very beautiful mottled grey marble has been lately found near Eureka, in Humboldt County. In Tuolumne County there are also very extensive deposits; most of it is of an unclouded white, fine grained, and extremely hard. Near Suisun there is a singular stone, which in its rough state looks very much like rosin; it occurs in large masses, from which blocks of enormous size have been cut. On the McCloud river there is a white statuary marble; it appears to be of fairly good quality, but very little of it has been hitherto worked.

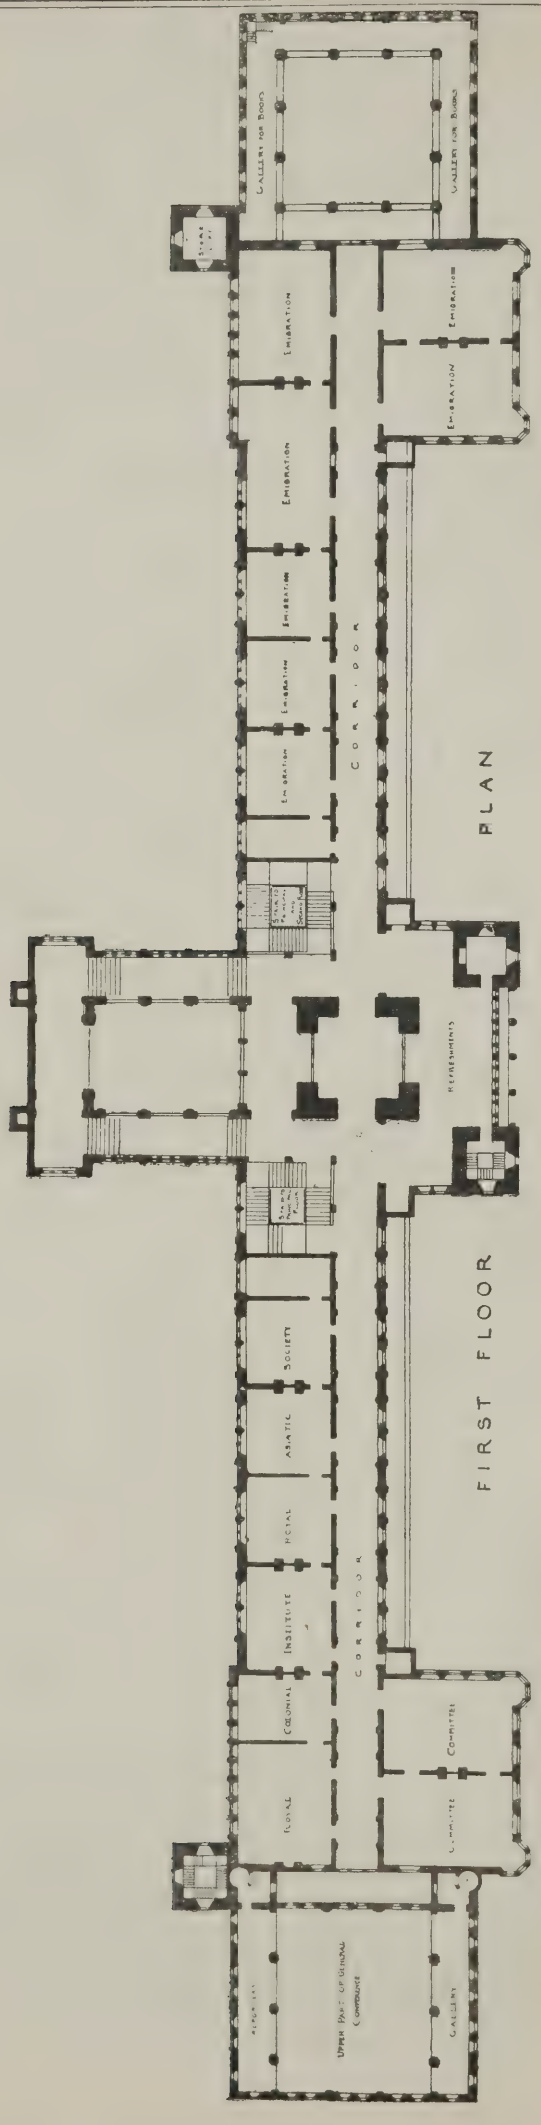
The Inyo marbles are found in the range of mountains of that name. They are dolomite marbles, and vary in colour from pure white through all shades of rose-red, grey, brown, and green to nearly black. They have been selected as the building material of the Sharon Gate, at Golden Gate Park, San Francisco. A very fine, brecciated, yellow marble is found at Tchachipi, in Kern County, and a species of onyx marble is found near a mineral spring six miles above Kernville. In Monteroy County, near Carmelo Bay, there are deposits of white marble, to work which the Pacific Carrara Marble Company was incorporated some years ago. Nevada produces a dark-grey veined marble, which is found at Bear Creek, three miles from Colfax; and the same district produces a very compact black marble, veined with white, which is found close to the Central Pacific Railway, about a mile from Colfax. Santa Cruz County produces a dark fossil marble, which is quarried about seven miles north-east of the town of Santa Cruz.

The Californian quarries also yield hand-

some specimens of Cipolino marble, white with shadings and streaks of green, and a marble very similar to the black-and-gold of Italy. There is also raised a variety known as "Ruin" marble. This is a yellowish stone, with broken lines supposed to resemble the ruins of fortifications.

It is somewhat singular that with such a profusion of excellent marble throughout the State, the Californian demand, which is always heavy, is principally met by importations from Italy. It is a testimony to the sterling worth of the Italian marbles which speaks volumes.

In the matter of literature the marble and granite trades of the United States are well cared for. There are two trade journals devoted to their interests. The *Reporter* is published monthly in Chicago. It is conducted with a considerable amount of ability. It is representative principally of the master marble workers and dealers. Another paper is known as the *Granite Cutters' Journal*. This more especially takes up the representation of the operatives who are engaged in the trade. Like the *Reporter*, it is a monthly publication. It emanates from Philadelphia.



THE IMPERIAL INSTITUTE.

A CLOSER and more critical examination of the designs for this building than we were enabled to give in our general description of them last week has enabled us to confirm some of our first impressions, and point to other features in them with a view of arriving at a general estimation of their merits. The design which the judges have placed first, by Mr. T. E. Collcutt, and of which we give the principal plans and perspective, has a very excellent arrangement as a whole, and, what is of importance, one admitting of easy extension in the galleries to be set apart for occasional exhibitions in connection with the Colonial Institute; and here we must say that only one of the other competitors has taken this primary object of the institution into the consideration it deserves. The museum or the gallery is essential, and its development ought to be regarded as fundamental. Let us see how this plan complies with the requirements. The printed instructions to architects, which we published on Feb. 25 this year, have been studied in more or less completeness. The programme of the requirements there laid down may be broadly subdivided as under:—(1) The public department, comprising the entrance hall, reception hall, the library and reading rooms; (2) the secretarial and general business department, containing the emigration offices; (3) the Colonial Institute accommodation, with the conference rooms and committee rooms attached; (4) the exhibition department, or the permanent and occasional galleries for the display of exhibits. These four divisions of the plan naturally suggested a general distribution of the buildings upon the site set apart for them at South Kensington, between Exhibition-road and Queen's Gate, a new approach or roadway being formed between these thoroughfares, parallel with the Natural History Museum, and on the site of the main gallery of the old Colonial Exhibition, given to the art products of India. The first-named subdivision, that devoted to the public entrance and reception hall, is placed as an axial block in the centre of the oblong site, the secretarial and business offices, retiring rooms, and industrial and general reading rooms left and right in the front block, while a parallel range behind, separated by open courts, is devoted to the galleries. At the west end of front range is a square conference room, 54ft. by 45ft., with two others, and at the corresponding east end the library and reading rooms. A front corridor gives access to the secretarial and other rooms. So much for the principal floor. On the upper floor, the front range contains in the left wing the Colonial Institute and Royal Asiatic Societies' rooms, approached by a similar corridor, with committee rooms in projecting wings. In the right-hand side we have the emigration department, with access to galleries over conference room and over libraries at the ends. The second floor plan includes the sample rooms and laboratories in projecting wings, a position which appears open to question. The separate public entrances to galleries at the extreme ends of front range on ground floor are well placed; the ground floor also comprises the stores, the dynamo, and hydraulic machinery below the reception hall. The general distribution of the galleries and front range, which run in parallel lines east and west, with the return end blocks, forming four quadrangles of elongated shape, giving an arrangement that leaves ample space between the north gallery and the existing buildings of the Royal Albert Hall and conservatory, and is undoubtedly the best economically. The grand entrance hall, with square base of tower, projects in the centre; behind it is the staircase, leading through an octagonal ante-room into the reception hall in the rear, thus forming a connected and *en suite* arrangement. The latter hall is 128ft. by 60ft., and has an apsidal end, with retiring rooms at the sides. A row of columns on each side of hall divide it into side aisles and a central avenue.

Mr. Collcutt has chosen a style of which he is an acknowledged master—a phase of Renaissance in which English details have been combined with Flemish characteristics. The front façade shows a centre and wing gable projections, each flanked by octagon turrets surmounted by cupolas, the intermediate and recessed parts having gabled dormers breaking a high roof. A prominent feature is a lofty, square tower, rising from the entrance hall, plainly treated, and broken only by vertical ribs, surmounted by a circular cupola. The latter is the least satisfactory portion, and in the angular view would look weak. Two other smaller square towers rise from staircases at the inner angles of quadrangles. The exquisitely-drawn elevation and perspective show some fine detail and frieze sculpture in relief. The most effective feature is an external arcade along the ground story with wide piers relieved by sculpture; large scale details illustrate these features and the gables. On the whole, the front is rather over-divided by small features and detail to the sacrifice of breadth, though each bay and gable by itself contains much to approve, and the delicacy of the drawing commands admiration. Looking at the details of plan we find several effective points, such as the ante-room connection between the cortile and reception hall; the latter is well-lighted and has a clerestory; the ante-room forms a centre or rallying point of the galleries, which extend from it east and west, while beyond the reception hall is another domical hall in connection with the northward low range of galleries. The decorative treatment of the reception hall is shown by the section; perhaps the proportion of the hall is a little high for its length. At the end of the galleries are staircases, and the return blocks are set apart for refreshments and retiring-room. Of course, there are points in the plan that will admit of modification to suit the requirements; the library, for instance, could be placed in a more central position than at one end of the front block, and the reading rooms also; but the author has hit upon a plan that is capable of development and of being made suitable for the purpose, and without expensive features. A little alteration, too, might be made at the east end of the first range; the library walls are perfectly plain, divided by pilaster strips, and scarcely join agreeably with the more elaborate front. Something could be done also to obviate the unsightly protruding corridor at the end on corbels over the library; the excrescence may be taken for something else, and looks hardly a dignified arrangement at this end, which will be fully exposed to view.

We next come to the design of Messrs. T. N. Deane and Son. There is much ability displayed in the plan and architecture, which is of a far more magnificent type than the authorities are disposed to adopt. The design is worthy of an Imperial Institute, and, indeed, might have been selected had the plan been a little more workable and the cost within reason. Messrs. Deane and Son have, at any rate, produced what we may call an "Academy design," imitating all the picturesque qualities of Blenheim with the magnificence of St. Paul's. As a Classical composition, it stands far above any other attempt, but it is rather too high-flown even for an Imperial Institute. It is more of a "poem in stone," or, as one visitor we heard remark, it is "all architecture and very little building." Like Blenheim, there are advancing loggias from the central block, uniting the portico and central block to the wings. These loggias are quadrants in plan, and at each angle of the projecting wings and flanking the portico are towers in pairs, crowned by cupolas, making in all eight towers in front, in addition to the great dome which rises above the central hall of the main building. There is some fine planning in the great hall; angle recesses or niches are formed for statues, and there is a statue of the Queen in the centre. From this central hall, approaches are made to the assembly hall on the left with apsidal end, and on the right hand to a conference hall, forming corresponding wings. The stairs and intelligence rooms are at the corners of hall; in front are the secretarial rooms, lighted by areas; the advancing quadrantal and returning wings on left provide for the emigration offices, those on the right for the Asiatic and Colonial Institute, each with distinct corridor. The main central wings right and left of the central hall are devoted to the conference room and assembly hall, with permanent museums on the ground-floor level, and these wings are emphasised as separate buildings seen above the front loggias. Behind the central hall is the library, with the reading rooms on each side, while in the rear, upon the same axis as the central hall and library, is a vast amphitheatre of elongated shape, with semicircular ends united to the return wings. The elevation towards the gardens is two stories with quadrant ends round the amphitheatre. The ground-floor level contains the museum for manufactures of the United Kingdom on the left and that for Colonies on the right. The great outer dome is proposed to be constructed upon an inner cone, like that of St. Paul's, with a lower decorative dome. The authors send details and coloured decorations to the hall. The perspective is a masterpiece of draughtsmanship.

The design of Messrs. Aston Webb and Ingress Bell resembles somewhat that of Mr. Collcutt, in being an elongated double quadrangle arrangement, the return wings projecting forward and forming massive pavilions, while in the centre of the front range an oblong block projects, devoted to the Institute proper. The authors divide their scheme into three main sections, the United Kingdom comprising the western wings round quadrangle, the centre portion the public and Institute section, including the transverse axial block, and the eastern wings the Indian and Colonial section. The front projecting block in the centre is devoted to the secretarial offices and committee rooms, which are approached by side corridors from front square hall. Beyond this is the principal staircase, top lighted, with two grand flights from the hall. In a line east and west run the main gallery, devoted to the United Kingdom and Colonies, with sample rooms forming the projecting ends of the return

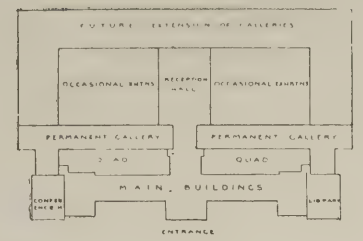
Thos. E. Collcutt, F.R.I.B.A., *Architect.*



eastern and western wings. Passing the main staircase we enter a reception hall with its axis north and south, 112ft. by 53ft. 6in., with a circular end. There are side corridors leading to the library in the rear of the reception hall, with the mercantile, general, and industrial reading rooms on each side, while in continuation on each side are the exhibition gallery, forming the north range of the building. On the first floor a general conference room, 79ft. by 53ft., is placed over the entrance hall, with other conference, committee, and refreshment rooms on the right and left. The galleries are continued on this floor also, one side being given to United Kingdom and another to Colonial products. Coupled columns divide the galleries into a centre and side avenues; they are top lighted at ends. There is much skill shown in the planning of the Institute group of buildings; the library and reading room are readily accessible to the public; the reception hall has retiring rooms at the north end. The transeptal arrangement given to the upper part of hall by extending the walls over the corridors secures ample light, and the projecting arms form central features in each of the quadrangles. There is shown a flat dome over the crossing, and the decoration shows a figure frieze representing Industry and the Arts; the roof is arched, with a clerestory over the corridor. An entrance to the gardens is obtained at each end of the buildings. The authors have selected a freely-treated florid kind of Romanesque, with two stories of round arched windows—in fact, the style of the Natural History Museum, with which the design is intended to harmonise, and form one complete whole with the arcades of the Horticultural Gardens. There is something to be said for this treatment. While there is much skilful handling of detail in the main features, we do not like the engaged columns with figures along the lower story; the pavilions at ends are rather lumpy, and the recessed attics would be lost to view; an exception must be taken also to the isolated tower standing away from the building opposite the main entrance. We cannot see the object gained by a detached tower, which would look unpleasantly like a detached chimney shaft, and would not "pull up" the centre masses of the buildings in the side view. The authors have followed closely the Natural History Museum details, and the design would work out well in brick and terracotta; the banded courses indicate this kind of treatment. The centre block is pronounced externally by projecting ends and a high figure frieze.

Mr. T. G. Jackson has a decidedly clever design in red brick and stone disposed in bands, displaying a masterly hand in English Renaissance and details of Early 17th century character, the main front being pronounced by an imposing tower which rises from the façade, and as it ascends is broken into five stages, square below and octagonal above. Lofty pinnacles at the corners fill up the angles. The outline is elegant and pleasing, and the general treatment reminds us of the Brussels Town Hall. The plan is a square, a large quadrangle occupying half the area between the front block and the north gallery. Here the great hall is placed transversely east and west, with large octagon-ended bay recesses, and with the conference room in continuation westward makes up the inner block. In front a long corridor gives access to the postal service rooms, secretary's department with board and committee rooms at end, on the west side of entrance hall, while to the right are the telephone and other rooms, emigration offices, mercantile reading room at end; at the corners are octagonal towers terminating the angles of front. The corridors going north on the return wings communicate on the left with the refreshment rooms, on the right hand with the emigration offices. The rearward block has also a centre corridor to the sample

PRINCIPAL PLAN

rooms, ladies' and gentlemen's cloak rooms. The museum for United Kingdom and Colonies surrounds the great quadrangle. On the first floor, at west in the front, is a library for readers, divided into bays; the corresponding half is devoted to the Colonial Institute rooms, and a conference room is at the end. The dining and refreshment rooms are in the return block. In the centre block are the conference room and great hall with bay windows, facing the large quadrangle, a daïs being at one end; on the right-hand return block follow the reading and retiring rooms. Between the two main blocks is a vestibule with principal staircase leading to the conference room and great hall, somewhat wanting in axial arrangement. On the second floor are rooms for the Asiatic Society, gallery level of library and committee rooms. Only the front and two returns to main block are carried up to this floor. Many artistic points are to be noticed in the arrangement of the plan, which has a college-like grouping; the vestibule and side projecting stairs are a feature, and the author shows some scholarly detail to this portion, which has a coved and decorated ceiling. The great hall has also a ribbed vaulted ceiling, and iron principals and ribs are shown above. The large elevation shows the ornamental gables which break the front roof; there are towers at the end. The red brick and stone are in bands, the former predominating and harmonising with the new roof.

Mr. Arthur W. Blomfield, M.A., adopts the round-arched style of the Natural History buildings in the north portion. The north front is disposed in bays subdivided by the windows of each floor, brick and stone in courses being shown. The plan is a double quadrangular arrangement; there is a large octagonal entrance hall 70ft. square in the centre, which dwarfs by its size the other features in connection with it. The front range on each side are set out in the following order: west wing, mercantile reading room next the hall, postal and telegraph offices, library, 110ft. by 36ft., with projecting bays, and at the end a projecting reading room; on the east are secretary's offices, committee rooms, general conference room, 86ft. by 32ft., with platform recess and emigration offices at the end. Passing the vestibule from entrance hall, and going northward, we enter the reception hall on centre axis of buildings with apse at end. It is divided by columns into five bays of 22ft. 3in. each, with a 44ft. nave and 8ft. 3in. aisles. A corridor surrounds the hall, and retiring rooms are on each side of apse. The galleries for natural and manufactured products of India and Colonies are over the western galleries, surrounding quadrangle. In the centre of the western block is a covered space for unloading. The United Kingdom products are similarly accommodated round the east quadrangle. Each "quad." is divided into galleries for occasional exhibitions as required by the instructions, and refreshment rooms are provided in the rear of the front range. The entrances to galleries are at the north end. The elevation to the front is very much broken by square bay windows and recesses, and there are two projecting loggias, with arched entrance, in front of main block; also two cupola-crowned towers over staircases at the extreme ends of the façade. The main centre block of buildings is lower than the side wings, which have high roofs hipped next the great dome. The general effect is disappointing. The façade, shown by a pencil perspective, of Renaissance character, is lost by the overcrushing dome in the centre, which seems to cleave the side wings apart, and to interrupt harshly the horizontal lines of the composition, which are accentuated. The façade is divided into bays of Classical features and cornices, a high roof with dormers.

We next come to a comparatively modest Classic building of 18th-century character in brick, with stone dressings, by Dr. R. Rowand Anderson, R.S.A., admirably suited for a hospital building, but hardly so for an Imperial Institute. The site is covered by a deep block of buildings with two museum courts. The reception hall, 115ft. by 52ft., is axially placed in the centre, with an apse at the end. In front are located the emigration offices on the left, and the secretarial department on the right side. The restaurants and dining rooms are on the return side block on the left with a vestibule approach; on the corresponding side are the sample rooms. The first floor on the left we have in front the Colonial Institute department provided for, with the conference room in return block, while on the right side are the mercantile, intelligence, and industrial reading rooms, and on the return side the libraries and laboratories, The author's design is well balanced, but the cupolas in centre and side are small and insignificant, and scarcely impart the dignity required. They are almost in amusing contrast to the prodigious domes of the last and a previously-noticed design.

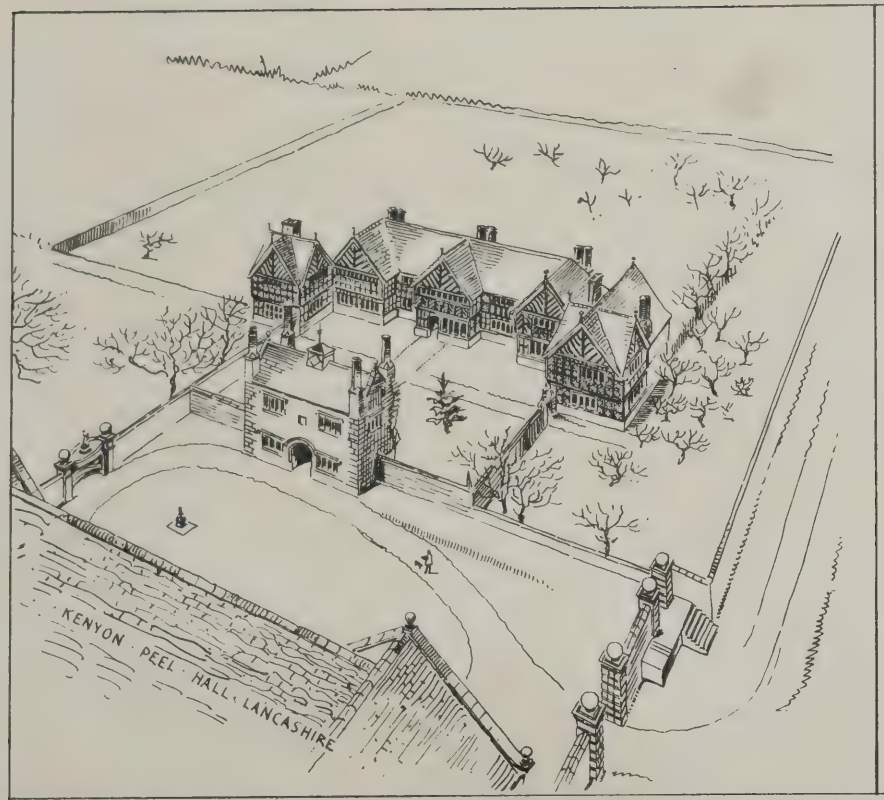
Nothing was said in the conditions about style, but it will be seen that four periods of the Renaissance have been tried, from the earlier English and Flemish varieties to the Monumental Classic. The Round-arched or Romanesque treatment adopted by Messrs. Aston Webb and Ingress Bell has much to recommend it, and the authors have displayed some breadth and skilful detail in the sculptural decoration.

For architectural dignity and massing, no site offered a better opportunity than the position chosen by the Imperial Institute Council; but, of course, we are not expressing in this opinion any agreement with the suitability of the locality for the new institution. The attractive work of Mr. Waterhouse, the Natural History Museum, has an almost unique position to the main road, and will, to some extent, cut off the view of the more extensive buildings of the Institute, yet it has the undoubted advantage of occupying the central position between the Museum and the Royal Albert Hall, which latter will form an imposing climax to the new structure. An opportunity is presented for displaying architectural grouping, such as will not soon occur again in the Metropolis. The Classical style is in keeping with the Italian garden and style of architecture of the surrounding buildings. The design of the plan in such a position is everything, as great care is necessary to make the most of the area so as to admit of future extension.

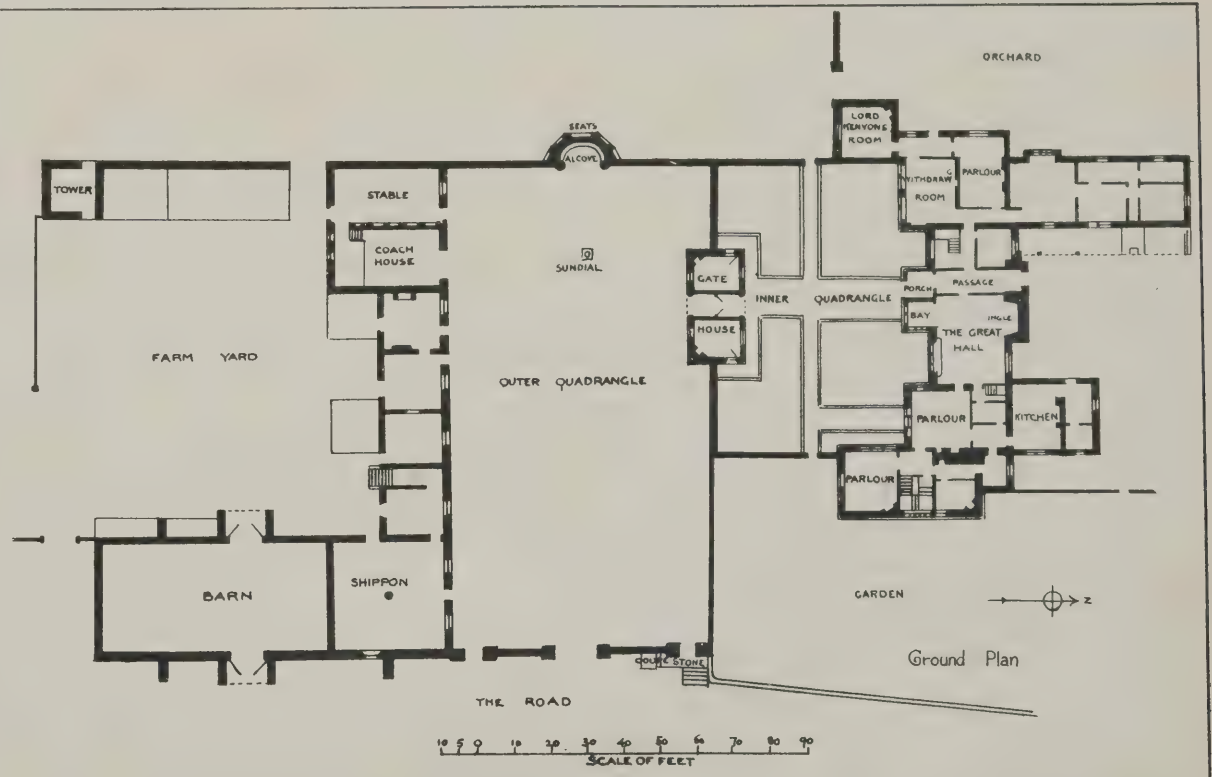
THE PLANS FOR NEW ADMIRALTY AND WAR OFFICES.

THE Select Committee of the House of Commons appointed on March 4th last to reconsider the plans and proposals for an Admiralty and War Office have just published their report. In 1884 the design of Messrs. Leeming and Leeming, of Halifax, was selected after public competition. The Committee, however, now come to the conclusion that the scheme of demolition and rebuilding should be abandoned. The report concludes thus:—"We are satisfied that by making additions to the present Admiralty all the requirements of that department may be suitably provided for; that this work, including some repairs and improvements to the existing building, can be done at a moderate cost, and may be completed within two or at most three years; that a very large reduction of expense for buildings would thus be secured, and to this must be added, as against the cost of erecting a new War Office, the value, estimated at £266,000, of the portions of the Spring-gardens site which would be preserved after providing for the suggested additions to the Admiralty and for the opening of the Mall into Charing Cross. We therefore recommend that the entire official staff of the Admiralty and War Office respectively should each, as soon as possible, be placed under one roof; and that the two buildings should be situated at no great distance from each other; but we are of opinion that these recommendations can be carried out, and that a great saving of money and time can be secured by adopting other plans instead of those which have been referred to us for consideration; and we find that the main buildings of the Admiralty may with advantage be retained. We further recommend that steps should be at once taken to insure greater economy and efficiency by bringing the clerks of each department to work together in greater numbers and in fewer rooms, and that the estimate of accommodation required for the staffs of the two offices should be based upon such rearrangements."

THE PROFESSION OF A CLERK OF WORKS.*



By THOMAS POTTER,



Author of "Concrete: its Use in Building," "The Construction of Silos," &c.

OF all the various occupations, trades, and professions which, from the architect downwards, are in some way or other necessary in the construction of buildings of importance, there is not one concerning which less is known by the general public than that of the "clerk of works." The clerk of works has of late years become an important factor in carrying out extensive building operations, and chiefly because of the keen competition existing, and the diminutive profits often made (where any are made at all) out of building contracts, which have rendered the strictest surveillance an absolute necessity, and the clerk of works a *sine quâ non*. Fifty years ago he was not considered by any means so essential as at present, the result being he was of small importance in a general way. When the press of that period furnished particulars of any newly-erected buildings, the architect and builder were the only persons whose names were given in connection therewith as deserving of mention; but at the present time that of the clerk of works appears as a matter of course. Even now we read and hear but very little of that functionary; he is not to be found airing his grievances or pleading his wrongs in the trade journals, and in this respect does not follow the practice of some of his employers. When a building is about to be commenced he is generally the first on the ground; and when completed is usually the last to leave. Where he comes from troubles no one, and where he goes to apparently nobody knows and nobody cares. The good and bad fortune which appear to be a peculiarity of the architectural profession, whereby some of its members, by merit and otherwise, monopolise a larger share of work than they can reasonably attend to, while others secure the crumbs only that are left, make it impossible for the more favoured portion to give that constant and personal attention to the details of works in progress which they otherwise would do; but assuming the clerk of works to be competent, painstaking, and trustworthy, it is doubtful whether any gain would result from irregular and divided surveillance, even were it practicable for the architect to take upon himself the *rôle* of clerk of works. A building of any importance is a mass of details where one error in construction may bring in its train a dozen others, and it is manifest that a minute knowledge of each and every portion, together with a perfect understanding of the intention of the drawings and specifications, should be acquired and directed by an individual, or individuals, whose entire time should be devoted to the fulfilment of these duties. Moreover, the tendency has been growing for years among many architects to give greater attention to the artistic element in connection with buildings and less to the constructive, whether to the general advantage of everyone concerned is another matter; at any rate it places more responsibility upon the clerk of works, and necessitates a superior class of man. The system of superintending building operations by a clerk of works whose whole time shall be given to a single building is subject, however, to certain exceptions in London and some of the largest towns, where architects may have several works in progress within a moderate distance of each other, and

* All rights reserved.

to each of which they can give a limited amount of personal attention. Individual works may not perhaps be of sufficient importance to employ a clerk of works entirely thereon, and with the frequent surveillance of the architect this necessity is still further reduced; the clerk of works' time is, therefore, divided amongst those of his architect's buildings which are being carried on simultaneously and at no great distance from each other, and as a matter of necessity he is then paid by the architect. The clerk of works' position in cases of this kind is analogous to that of the contractor's walking foreman; but although there is practically no remedy, the system is scarcely a good one, and rarely works well. The divided surveillance, which affords a loophole for an astute builder occasionally to creep out of, and the absence of personal supervision at times when it is usually most wanted, have to be carried to the debtor side of the profit and loss account. The title given to the clerk of works at the head of this article may be considered a misnomer; but I plead a difficulty on this point, inasmuch as his is not a trade, if so it would be difficult to define it, while it is certainly not a business, and the terms avocation, vocation, occupation, &c., are too far-fetched and indefinite. Nowadays, too, the three recognised professions of divinity, law, and physic represent not a tithe of what are by courtesy commonly known as professions. But having selected the title in default of a better, and with no other object, it may anyhow be considered a matter of but little importance. The term and vocation of "clerk of works" can be traced back many centuries; Gwilt says the earliest instance of which we have any record of the name being used is in connection with certain works done at Windsor Castle in 1241. William of Wykeham also held an appointment as "Clerk of all the King's Works," but which partook probably more of the character of architect, according to the designation as understood at the present time. In Hollingshead's "Chronicles," however, we learn that in 1350, William of Wykeham received 1s. a day as architect to Edward III., while his clerk of works received 6d. a day, and some clue is afforded as to the comparative remuneration then enjoyed by the architect, clerk of works, and mechanic, to note the wages of ordinary workmen at that period. According to the same authority, "master freemasons" received 4d. per day, other masons 3d., a master carpenter 3d., other carpenters 2d., their helpers 1½d., plasterers 3d., and tilers 3d. Probably the terms "master mason" and "master carpenter" had reference to what we should designate at the present time, "foreman mason" and "foreman carpenter." The rate of wages as here given was apparently the standard all over the country, and fixed by authority, for we read that a law was passed enacting that both building mechanics and helpers were to be placed in the stocks for refusing to work, or demanding higher wages; at a later period this was supplemented by another, ordering that incorrigible defaulters in either respect were in addition to be branded on the forehead with the letter F. The good old days evidently would not have been appreciated by those sections of the working classes of modern times whose *penchant* is to strike for higher wages at fitting opportunities, and rigidly keep the festival of Saint Monday and of other Saints whose names are not to be found in the Calendar. Chaucer, the poet, held an official position as clerk of works; we don't, however, learn that his fame rests upon his abilities for filling the latter position; probably he found the two occupations of an incongruous character. There are reasons for believing that the clerk of works, so-called, of that period was, however, not exclusively engaged in superintending building operations, and may indeed, have had little or nothing to do in that direction; but, as the name implied, was the accountant or clerk, and whose duties principally or wholly consisted in keeping the books and accounts; the master mason and master carpenter would superintend their respective branches, and their only superior possibly was the architect himself. If this was really the general custom in those days, we have an instance of a title coming down to the present time with quite different duties attached to it. Dance, the architect, was clerk of works of the City of London; but it would appear as if the title was retained long after the positions of architect and clerk of works had become more clearly defined, for not longer than 120 years since the City clerk of works was in the habit of meeting his artificers once a week at the Moorgate coffee house to receive his instructions. The artificers referred to were no doubt the master tradesmen of the various building trades engaged in carrying out work for the Corporation, and not ordinary mechanics. Clerks of works at the present time form, all told, a very numerous body, for there are, besides the architect's clerk of works—so called because he is intrusted with carrying out the designs of the former—many in the service of railway and other public companies, to construct and maintain their stations and general buildings. Large institutions, asylums, cathedrals, and similar important structures have usually a clerk of works and staff of workmen, more or less in number according to requirements. Civil Service clerks of works are employed to superintend the erection and repairs of public buildings, and landed estate clerks of works perform the same duties in connection with the mansions, farm-houses, and other structural works which form a portion of large agricultural and residential properties. Practically, the duties of each of these different sections assimilate, but with certain distinctions. For instance, the architect's clerk of works is usually engaged but for the limited period of erection occupied by the buildings the construction of which he is to supervise, for it would be impossible for architects with a moderate practice to guarantee that as soon as one building was completed another would be ready for commencement; but with most of the other branches—if the term is applicable—the employment is more constant, and in some cases (the Civil Service and on landed estates, for example) is often of a permanent character, subject, in the latter instance, to the continuance of a necessity for a clerk of works and the maintenance of his personal qualifications. Necessarily the extent and importance of the buildings, &c., over which the clerk of works has to exercise his functions vary considerably; they may be of so limited a description that his position is almost a sinecure, or they may be just the reverse. Dealing firstly with the architect's clerk of works and the two important factors in connection with that position, duties and qualifications, it may not be out of place to ascertain what were the requirements forty years ago. A writer in the *Builder* in 1847, possibly an architect, thus enumerates them:—"The primary duty is the superintendence of the works, to see that the drawings are fully carried out in all their dimensions, constructions, and details; that the specification is fully obeyed in all particulars; to prevent the admission of unsound, defective, or improper materials; and that things are of their proper size, weights, and qualities. For all these purposes it should be absolutely necessary that he should be the first man on the works in the morning and the last man off at night, and not leave the building when, in his judgment, injustice may be done to his employer in his absence. It is his duty also, in case of his discovery of any defective construction, to report the same to his employers, for however carefully a set of drawings may be studied, there are generally some points arising in the course of execution that seem not to have been studied at all; in such cases an instant report to his employer is required. In measuring up, it is his duty to be strictly honest to his employer, however much his feelings may be in favour of the builder, and in paying bills the practice of deducting commission should be especially avoided. To sum up, his duty is honesty, integrity, and uprightness, both to his employer and the tradesman, favouring neither one nor the other, and as such he is in a place of great trust." Mr. G. G. Hoskins, F.R.I.B.A., a few years since wrote some articles in the BUILDING NEWS called "The Clerk of Works," which were afterwards published as a small handy volume. Mr. Hoskins places the duties and necessary qualifications together, and which, summarised, are as follows, prefacing them, however, with the remark that although the clerk of works is paid by the employer, the former should always remember he is appointed by the architect, and responsible to him:—"The clerk of works must be of known integrity and vigilant in the performance of his duties; must possess a practical knowledge of the various building trades; had experience in measuring and valuing executed work, and also of materials previous to use; a knowledge of drawing and practice of ready sketching; capacity to furnish reports at fixed intervals, including a valuation of the work executed, materials on the ground, and such remarks as circumstances may suggest; essential that he should be fairly acquainted with the current prices of raw materials; competent to note all work not in the contract and hidden during progress, and taking measurements of same," and the performance of minor matters not necessary to be described here. The duties forty years ago appear to have been somewhat different to what they are now, for it is not usual at the present time for the clerk of works to measure up the work where it is being done by measurement or according to a schedule of prices, or where extras in a general contract crop up; but by the architect, or someone appointed by him, and on the builder's part by his own surveyor or measuring and estimating clerk. It is the practice, however, for the clerk of works to take notes of and agree with the builder's representative as to extra depths of foundations, extra brickwork, masonry, or work of any kind that may be in excess of the specification or drawings, and which cannot be readily ascertained after the buildings are completed. Nor is it customary for the clerk of works to pay bills. Practically there would be none to pay where the work was executed by contract, except the periodical instalments which the clerk of works has nothing whatever to do with. The writer in the *Builder* of forty years ago apparently alludes to a system of employing tradesmen for each branch in the same way that several important works have been carried out of late years—viz., without the intervention of a general contractor, letting portions piecemeal, labour only, or labour and materials as may be found most expedient and executing other portions with day workmen, the whole being under the general supervision of a clerk of works. Nor is it the general custom now for the latter to commence his duties at the same time as the builder's workmen, although in this point there is a difference in practice, for some architects, in provincial towns especially, expect him to be on the works during the same hours as the workmen. This is scarcely reasonable, for there are many occasions in which he has to spend considerable time after the workmen have left in preparing working drawings, examining details, checking dimensions, or other clerical duties which he finds can be attended to in a much better manner quietly and without fear of interruption. The early morning as a rule is not the time when the greatest vigilance is necessary, but rather when work is in "full swing." At any rate where the hard and fast line is laid down that the clerk of works must be on the works when workmen commence for the day, it may be safely assumed that in the majority of cases he makes himself a similar hard and fast line of quitting the works when the workmen leave for the night, no matter what pressing matters need attention for the morrow. On the whole it may be safely accepted that when the clerk of work's hours are fixed to commence at nine, making it optional when he thinks it necessary to be there earlier, the work is better looked after than when he is expected to begin his duties hours previously, and no doubt exists but that the majority of clerks of works, rightly or wrongly, look upon the early system as an unfair one, and possess no qualms of conscience in balancing the account in some way or other before the work is completed if an opportunity offers. It will be obvious to the general reader that the responsibilities of a clerk of works, according to the authorities quoted, are of no mean order; more important, indeed, now than at any other period, for not only is competition in tendering for the whole of the work in a building, the recognised principle in most parts of the country, but usually the lowest tender is accepted no matter whether it represents a fair price or hundreds of pounds less than what the cost, if done well, will probably be. It is almost needless to say that the practice of adopting a hard and fast line in this respect does not find favour with many architects, who, however, have often to

KENYON PEEL HALL NEAR TYLDESLEY.

View drawn by MAURICE B. ADAMS F.R.I.B.A.

Photo-Lithographed & Printed by James Akerman, 6, Queen Square, W C

way to the wishes of clients, the universal ng of self-satisfaction at making what ars a good bargain predominant. Perhaps le end there is a revulsion of feeling in respect. When a low tender has been pted, the clerk of works' position may y well be guessed, for although the builder in his own heart wish to do his work well, but human. Self-preservation is the first of nature ; and when he finds he is slowly surely spending his own money on another 's building, he is prone to try by every llable means in his power to confine the unt so expended within the smallest possible pass. It is then the clerk of works' bles begin in earnest, and the experienced will tell you that, do the best he can in cases, the buildings, when completed, are creditable to any one concerned. Accord- to Mr. Hoskins, the qualifications a clerk orks should possess do not at first glance, ough they include many duties, appear to f a very searching character. In reality, ever, they comprise more matters of general wledge than any one man can reasonably ect to become thoroughly perfect in within compass of an ordinary lifetime. A tling assertion, I admit, but nevertheless . "Must possess a practical knowledge of various building trades" is a formidable n, for it means a thorough knowledge of ivators, bricklayers, masons, carpenters, and other allied occupations, and not a mere erficial knowledge, which is quite another ter. Many individuals possessing a certain unt of mechanical genius acquire with but e tuition a smattering of draughtsmanship, entry, masonry, painting, and such like ul knowledge in its way ; but just the rse when put into practice under the wrong ression that the possessor thereof is com- nt to act as clerk of works, or practise as a der, or even as an architect, if by an illimit- amount of assurance he can persuade clients accept his services. It is a common error ng persons unacquainted with building ters to imagine that individuals of this de- ption, if incapable of undertaking the duties responsibilities of a builder, are at any adapted to fill the position of clerk of ks, for they argue that the builder is a ctical man who knows his business, and ploys capable foremen and competent work- n, that he sets out the buildings and all the ils, and the clerk of works has simply to that what he does is done properly. This is utterly fallacious argument ; it requires but mited experience and average practice to w if work in a general way appears to have n done well. But in a clerk of works this ot enough ; he should know *when* it is being e well, and, further still, if it is being cuted in a skilful and workmanlike manner. instance, assuming a massive wooden stairs laborate design is being constructed ; it is only essential that it should appear on com- tion soundly executed, but that the seemingly lless amount of hidden work in framing, ssing, housing, and fitting should be cor- tly performed, and if the clerk of works is thoroughly acquainted with all the minutiæ details connected with that class of work, w can he detect shortcomings? Again, there y be some intricate design in masonry to be formed, or alterations necessitating a special owledge of shoring and under-pinning, or ficulties in the way of securing a solid ndation, or fireproof floors to construct, or aborate cornices, friezes, and decorations to be rried out, all of which are as opposite in eir character as can be well imagined, but e to be performed, or intended to be, in the st possible manner, and the methods of doing hich are supposed to be within the knowledge the clerks of works.

(*To be continued.*)

DAY AT PETERSFIELD WITH THE HAMPSHIRE FIELD CLUB.

THE neighbourhood of Petersfield was visited by the Hampshire Field Club last week. he members first visited Petersfield Church, hich contains some fine examples of Norman ork. The west doorway and the chancel rch are of special interest, with their zigzag nd diaper-pattern mouldings. The tower is t the west end of the church ; but it appears from a moulding which springs from one of the piers supporting the chancel arch, that was originally a central tower, the present chancel arch with the pillars over it forming the east side of what was probably a lantern tower. The church was built about the year 1150, and the town must have had its origin about the same time, for it takes its name from the church, which is dedicated to St. Peter. On Petersfield Heath, which forms a recreation ground for the town, some examination was made of a remarkable group of pre-historic burying places, about eighteen in number, of several distinct shapes. Of these, Mr. W. Dale, F.G.S., gave some description. Mr. T. W. Shore also made some remarks about this ancient burial place, saying there was not in any other part of Hampshire so large a collection as on this heath, and there were no doubt formerly many besides the eighteen now visible which had been obliterated. Weapons and implements of this Celtic people have been found ; an unusually fine bronze spear-head and a bronze blade or dagger was found about 1847 in draining operations at Sheet, as also was a blade of dagger 15in. long of a type comparatively rare in England, but common in Ireland. Of their earthworks were mentioned the entrenchment lines of Froxfield, as if to defend against any approach to Stonor and Ashford Hills from the westward (each entrenchment has the ditch on the west and the bank on the east), the remains of earthwork lines on the west of Butser Hill, and the great camp at Old Winchester Hill. By the kindness of Mrs. Minty, Mr. Shore was enabled to show the party an ovoid stone of considerable size found in one of the Petersfield barrows. This stone, which had been well rounded and polished, Mr. Shore suggested was buried with a body as a symbol of immortality ; but this view was combated by Mr. Dale, who thought it was a millingstone or muller, such as are found in the lake dwellings of Switzerland, worn into its present shape by rubbing up the corn ; and this view was supported by Dr. Seymour Haden. A small piece chipped out of it showed it to be a Wiltshire Sarsen stone.

A move was next made to the Ridge, Froxfield. On Lith Farm attention was called to some blocks of flint conglomerate, and on the top of the Ridge Mr. Dale made some remarks on the geology of the district, saying they were at the extreme western end of the Weald, a vast natural amphitheatre shut up on all sides by chalk hills, except on the east, where it is bounded by the sea. Each side the chalk forms a long bold escarpment called North and South Downs, ending on the one side at Beachy Head and on the other at Dover cliffs. This area consists of beds older than the Cretaceous rocks. This Wealden area was not a great bay of the sea, but was once entirely covered by the chalk beds, thrown up into a long dome, as it were, by the old disturbance that made the London and Hampshire basins. In the course of long ages the top of this dome of chalk got planed off, to use Sir A. Ramsey's expression, by sub-aërial denudation, exposing the softer bed below, and leaving the chalk in bold escarpments each side, which are still working their way back. That this great area was not a bay of the sea was shown by the drainage system ; the rivers did not run out eastward, but cut their way through the chalk on the north and south, and thus found their way to the sea, as is the case with a small stream which rises near here, and flows easterly for some time, but soon joins the Arun, and the Arun has an exit southward which it has made for itself. When these rivers first began to run the whole country was much higher. They ran off the top of this chalk dome, and as the ages went on and the chalk became removed, these rivers still kept their same courses, only excavating their channels deeper. On this ridge are the remains of a Roman encampment, now not very clearly defined, and scattered about the borders of the fields were bits of Roman pottery and tesseræ. Mr. Shore said there was no spot in Hampshire which showed a more continued occupation by man than this. The name Froxfield was a corruption of Folks' field, and it was so called in a MS. of 1434. It was then the field where the ancient community ploughed their fields with oxen, still used for the purpose in this part of the country. In the Pavilion on Petersfield Heath, earlier in the day, a fine specimen of Roman tile (lent by Mr. J. Silvester, of Slade) was exhibited, from the site of the Roman station at Froxfield, where a shallow bath has been brought to light. The remains of tesseræ and pottery found here are of a type common in Hampshire. Steep Church (a little building with half-timbered tower and tiled roof and dwarf spire) was the last place visited. This contains inside some interesting details of Norman work ; the nave is separated from the aisles by Norman arches, though some of the pillar capitals have been renewed. A special feature here is formed by the steps to the rood loft, of which there are very few examples in Hampshire.

SPECIMENS OF RENAISSANCE CARVED OAK.

WE illustrate to-day a few sketches of Renaissance oak carved in a manner characteristic of that period. The cabinet at top of page has a good frieze, and the panels are treated with Scriptural subjects. The chair on the right is Italian of good design, though the legs and carved staining piece are somewhat too heavy for the upper part. The knocker is rather crude in conception, but vigorous in execution. The mirror is a pretty piece of furniture, the cherubs and shields being well carved. The cabinet next it is of the same suite as that at the top of page, but it is not so well carried out, and the carving is very feeble in places. The whole of the oak belongs to Mr. Ichenhausen, who kindly allowed us to sketch it.

ST. COLUMB'S HALL, LONDONDERRY.

THIS hall is now in course of erection for the St. Columb's Total Abstinence Association, Derry. The great fall in site afforded scope for ingenious planning, and the successful architects seem to have converted apparent disadvantages to advantages. By careful manipulation of the levels they have obtained entrance from street to each floor direct, the the ingress and egress to assembly hall being especially convenient. Besides the accommodation shown on plans, there is provided on first floor a large reading-room, also committee-room, balcony, &c. The cut stone being used is from the Dungiven and Dungannon quarries, the balcony over portico being carried on polished red Aberdeen granite columns and pilasters. The group on pediment over main entrance, representing Erin, Temperance, and Industry, is being executed by Mr. C. L. Harrison, sculptor, Dublin, and the general contract has been intrusted to Mr. Joseph Ballantine, Derry, who is carrying out the works under the superintendence of the architects, Messrs. Croom and Toye, Derry, whose design was selected by Mr. Thos. Drew, R.H.A., Dublin, in limited competition some time ago.

The new Post office at Halifax was opened to the public for business on Thursday in last week. It is in the Early English style, freely treated, and has frontages to the new Commercial-street and to Old Cock-yard. The principal front has a length of 108ft., and here are the letter-boxes, the entrance to the spacious front office (43ft. by 16ft.), and the entrance to the Inland Revenue department. Other rooms are provided for the despatch of the postal and telegraph business. The new building covers an area of 1,050 yards. It was deigned by Mr. H. Tanner, of the Board of Works, and the contractors were Messrs. Armitage and Hodgson, of Leeds.

The memorial stone of the new church for the Barony parish of Glasgow, which is being erected a little to the south-west of the present old Saxon edifice, in the vicinage of the cathedral, was laid recently. The church is being erected from designs by Messrs. John Burnet, Son, and Campbell, of Glasgow, which were chosen in competition, the style adopted being a Scottish development of the Early English style. The walls are to be of rubble freestone, the open roof to nave of red pine, the seats of pitch-pine, and the floors of wood. We illustrated the church in the BUILDING NEWS for Jan. 7th and 14th of the present year.

A new organ was opened on Thursday in last week in a church on Callow Hill, in the district parish of Dewsall, Herefordshire. The instrument was built by Messrs. Brindley and Foster, of Sheffield.

THE IMPERIAL INSTITUTE.

WE give this week a double-page view and plans of the selected design for the Imperial Institute, by Mr. T. E. Collcutt. We have elsewhere entered fully into particulars with regard to the six designs submitted, and will only add a hope that in execution Mr. Colcutt's design may be modified as little as possible. Next week we shall illustrate the other five designs submitted. The foundation-stone is to be laid on Monday next by the Queen. A temporary pavilion has been erected for the occasion, seated for 11,000 persons. It has been built by Messrs. Lucas and Aird, and is 340ft. by 210ft., there being 30 tiers of seats, each rising by about 10in. There are 12 entrances. In the centre is a dais 32ft. by 24ft.; this is covered by a canopy, which, together with the whole of the seats, is covered with crimson cloth, and cocoa-nut matting is to be laid along the passages dividing the various blocks. Upon the daïs will be placed about 40 gilded State chairs from the Lord Chamberlain's office. The foundation-stone is a block of grey colonial granite, weighing more than four tons. Sir G. H. Chubb has presented a casket 2ft. long and 15in. deep, which will be deposited in a cavity in the stone. It is made of copper and brass. On the front are the letters "V. R. I.," and the dates 1837 and 1887. The position of the stone is as nearly as possible in the centre of the façade of the proposed building.

TRINITY COLLEGE, OXFORD.

THE new house for the President, which is now nearly finished, will complete the new quadrangle of Trinity College, which has been built from Mr. T. G. Jackson's design. The first part consisted of a long range of buildings bounding the new quadrangle to the east, and containing undergraduates' rooms, lecture and reading rooms, and a set of rooms for a Fellow. The President's house forms the north side of the quadrangle between the new buildings just mentioned and the east end of the College chapel. The site of the new quadrangle was formerly occupied by the President's kitchen garden and stabling, and on the site of the new house stood a building containing undergraduates' rooms, which was built by President Bathurst in the last century. It possessed no architectural interest, and was unsubstantially constructed. The contractors for the first block of buildings were Messrs. Parnell and Son, of Rugby; and those for the present building are Messrs. Horsman and Co., of Wolverhampton, Mr. E. Long being clerk of works for the College buildings, and Mr. Mockford for the President's house. Our illustration is reproduced from the architect's own drawing, now at the Royal Academy.

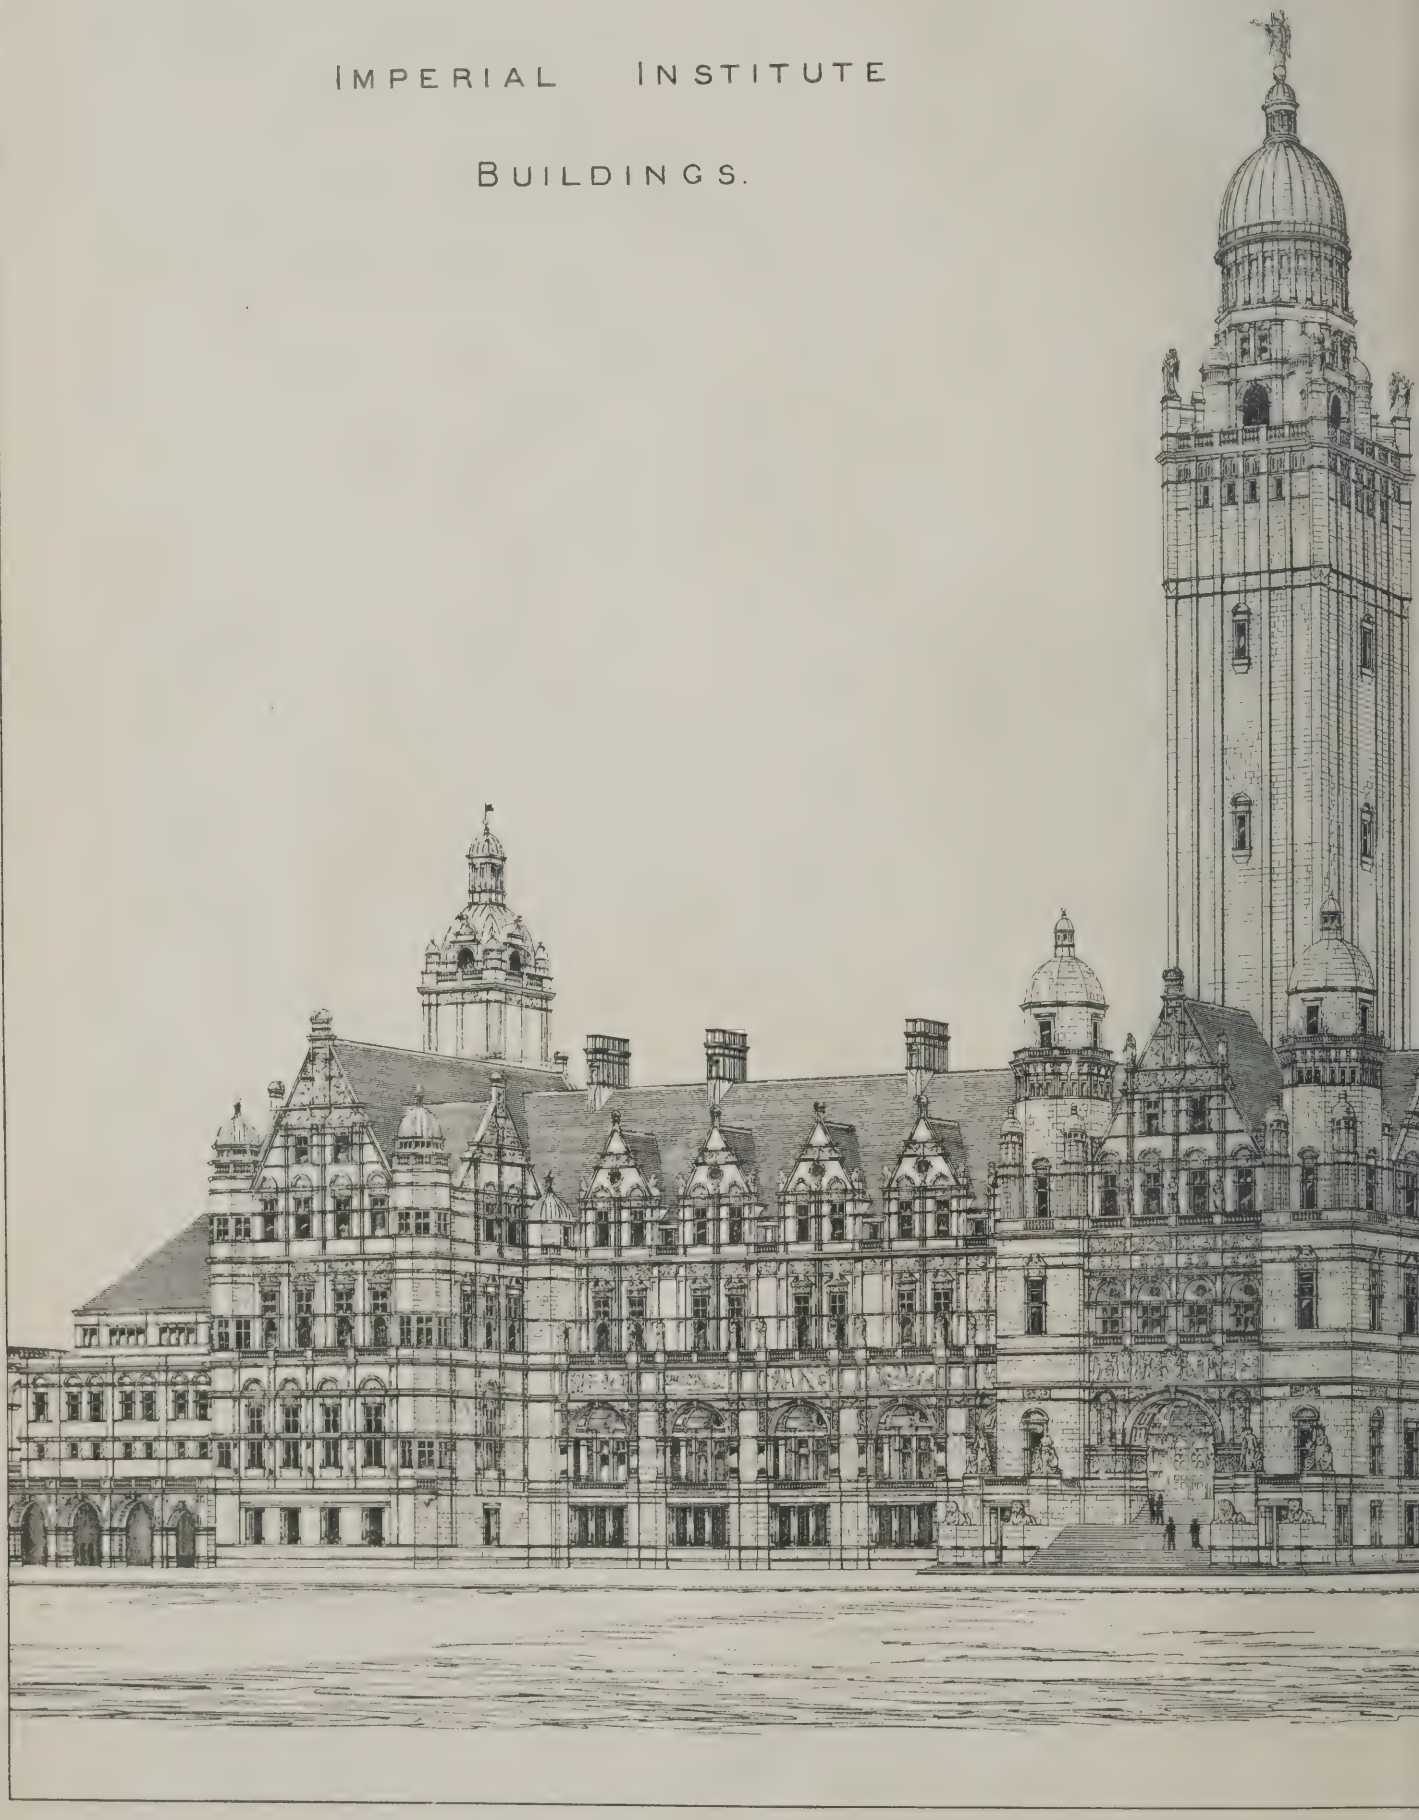
FOR description see page 36.



SELECTIONS FROM THE ROYAL ACADEMY EXHIBITION, 1887.

THE exquisite landscape by Mr. B. W. Leader, A.R.A., called "An April Day," of which a reproduction from the artist's pen-and-ink sketch is printed herewith to-day, is one of the few unquestionably great pictures in the present exhibition. The old timbered church represented once stood close to the painter's house at Whittington, near Worcester, and it furnished the same subject which Mr. Leader painted three years ago with the title "In the Evening Time it Shall be Light." Everyone, of course, is familiar with that celebrated picture. In "An April Day" the scene is cast looking the reverse way, with a spring morning effect instead of a winter's sunset. Nothing of architectural interest is known about the church itself, but the artist has invested it with a reputation for picturesqueness, at any rate, which is not likely to prove of a mere transient character. The shower is over, and we who have been standing up under the yew tree, or in the church porch, need not be told that a wet walk through the long spring grass lies before us. The elms and the oaks are not yet in leaf, and the lambs by their mothers' sides nestle close alongside, for the air is fresh and chill. The farmstead adjoining the churchyard was painted, like the meadows, from nature, and by its welcome comeliness the house inspires a confidence as we pass on our walk that, should the passing cloud prove a harbinger of a really wet day, here, at least, will be found a refuge from the elements. The spirited sketch gives an admirable idea of this masterly performance. Mr. G. A. Storey's "Young Prodigal" is full of life, character, and colour, and the picture is replete with interest and humour. "He has reckoned without his host," and so the ancient *roué* in the rear, under cover of the landlord's application, rises, as if suddenly inspired with a cute idea that as the repast is over he, at least, had better be going, while his other "jolly companion," warmed by the genial influence of the wine, defiantly drinks the host's good health in the unpaid-for liquor. The lasses, like the laddies, are gaily dressed, but there is nothing too loud at the moment in their apparent behaviour. In the distance sit two gamesters, and the festive character of the grounds indicate with some distinctness that the style of company usually entertained here is matched by the proprietor. He, with powdered wig, gay waistcoat, and clean apron, bows politely to the company as he demands payment of his bill. Young Folly empties his pocket swab upon the table, and, no doubt with perfect truthfulness, declares that these are all the coins with which he has to pay. The waiter lad, well trained in mischief, grins at his master's misfortune, while the slumbering dog and cat suggest that the party has been one of some considerable duration, and thus it may be safely relied on that the bill is no light one. The sequel to the *al fresco* repast remains for the imagination of the spectator, though with reliable accuracy it may be taken for granted that the end thereof was less entertaining than the beginning. Of Mrs. Ernest Normand's (Henrietta Rae) two life-like paintings of the nude, little need be said beyond a special reference to their charm of colour and refined drawing. The smaller picture of the two—"A Naiad"—is hung on the line in the last room, and the life-sized figure of "Eurydice" is well-placed in Room No. 6. This picture, of which the artist's pen-and-ink reproduction gives a very good idea as to form, has worthily attracted considerable attention. It represents Eurydice in the act of sinking back to Hades, from whence Orpheus, by the melody of his lyre, had obtained from Pluto her restoration on condition that he did not look behind him before he reached the earth. The two other drawings, lent us by the sculptors, represent two groups of interest—viz., "An Ancient Trick," by Mr. H. C. Christie, and "A Duet," by Mr. Edouard Lantéri. Both sculptures explain themselves.

KENYON PEEL HALL, NEAR TYLDESLEY.

THE well-wooded situation and charming surroundings of Kenyon Peel Hall always added, no doubt, to its great picturesqueness, while the close proximity of the old Roman road from Manchester made the place of comparatively easy access. The new line running between Bolton and Manchester has brought the old hall within the sound almost of the steam-engine, and a walk of about a quarter of an hour from Little Hulton Station will bring the visitor to it. Owing to the mining operations under the house many settlements occurred, and the place had to be shored up; but lately a thorough repair has put the fabric in order, though this has been done with but little regard to the historical character of its architecture. Our view was taken previous to these restorations. Facing south, the house and buildings are arranged round three quadrangles after the symmetrical fashion characteristic of the 17th century, as shown by the plan which accompanies our view to-day. A stone-built barn forms one side of the first quadrangle, which is devoted to a farmyard with a shippon (as a cowhouse was called), a stable, outhouses, and cartsheds. The stone column or shaft in the centre of the shippon deserves mention. The stone mullioned windows of the stables facing the middle quadrangle are well proportioned, and here and there the façade is enriched by date stones or carved coats of arms. Over the great doorway of the gatehouse runs the legend:—Peace be within these walls. 1637." and by the side of this are the initials, "R. G. B." Some have said that the gatehouse building was used as a courthouse, the great room over the archway (measuring some 28ft. long by 13ft. wide) being so designated. The bell cote over is said to contain a silver bell, with the following inscription upon it:—"Come away, make no delay. A.R., 1731." The sundial in the central quad, the alcove in the wall, and the entrance gate piers with the old mounting block by the side all add to the quaintness and interest of the old buildings as the visitor, with but a small effort of imagination, peoples the quadrangle with a busy group of retainers waiting to attend the host and hostess of the hall, accompanied by their guests of courtly degree and of latest fashion on some hunting party or similar expedition in gay costume and brilliant trappings. The flanking walls east and west of the main front of the house have gateways in them, surmounted by stepped gables. That on the western side has the inscription $\frac{R.}{G.\ B.}$ 1634 upon it, and on the other gable are the initials of George Rigbye, and dated 1631, showing that he was the builder. The hall itself is erected on the plan of the letter Π, the central wing being rather of less projection than this character would show. It is half-timbered, or "magpie," in black and white. The rooms are low, and the whole design is exceedingly picturesque, though the slates lately put on the roofs in place of the old grey slabs of stone are a great mistake, and do much to spoil the character of the place. The plan, which is reproduced by permission from "Old Lancashire Halls," shows the arrangement of the buildings and the disposition of the great hall in the centre of the house. The ingle nook and bay window are rather unusually placed, and, like the high table at Barcroft, the daïs stood here, probably facing the great fireplace. The old chimneypiece, once so rich in carvings, has now gone, and the timbers of the ceiling are plastered over. Some of the apartments are still furnished with good wainscot panelling, and have nice fireplaces, with what are now called overmantels, and in many ways internally the mansion is of considerable interest. Rames' Notes to Gastrell's "Notitia" furnish the following account connected with the history of the place:—"Peel Hall was rebuilt in 1634 by George Rigbye, fourth son of Alexander Rigbye, of Middleton, Esqre., and conveyed by marriage, in 1657, by his sole daughter, Alice Rigbye, to Roger Kenyon, Esq., M.P. His descendant, Lord Kenyon, was appointed Chief Justice of the Court of King's Bench, and created Baron Kenyon in 1788." The property still remains among the estates of the Kenyons. Mr. Henry Taylor's bird's-eye view shows the general grouping of the place with the gatehouse and forecourt. We are indebted to him for much of the above information respecting the house, and for permission to reproduce the isometrical picture from his interesting book on "Old Halls."

OUR COMPETITORS' COLUMN.

IT goes without saying that our object in proposing our fifth subject was, to some extent, a selfish one. To be candid, we expected that it was just possible that some of our readers, while responding to our invitation to submit suggestions for the improvement of the BUILDING NEWS, might favour us with opinions more or less direct respecting the existing features and characteristics of the journal, and we have not been disappointed. The frankness of some of our readers is as refreshing as it is only fair to ourselves to say their suggestions are impracticable. The authors of most of this sort of advice seem to labour under the delusion that a newspaper is printed in columns or pages and afterwards stuck together on a sheet. We may perhaps be allowed to say that this is not so, and that the fact unfortunately disposes of a good many ingenious ideas for the improvement of pagination, and the arrangement of matter and illustrations, with which we have been favoured. All such matters, we assure our readers, receive full consideration here, and if self-evident improvements of the kind are not carried out it is only because the exigencies of a newspaper office prevent it. It must be remembered that the BUILDING NEWS is not a book which can be carefully indexed and consecutively arranged at leisure, but a newspaper, and that, as is the case with most of its contemporaries, the time allowed for its mechanical production is to be counted by hours, and grows yearly shorter and shorter. Some of the diametrically opposite recommendations of our contributors are amusing. One gentleman says, "Double the space accorded to 'Intercommunication'; it is the most valuable feature in the journal." Another says, "Do away with 'Intercommunication,'" and is good enough to add that "it only affords amusement instead of information." Possibly, with a lively remembrance of the fable of the old man and his ass, we shall best assure our own continued prosperity and usefulness by persevering in our present course, in the face of these and a few other similar diverse counsels. We may perhaps next be allowed to say that we certainly did not contemplate the inclusion in the suggestions we invited of such matters as the desirability of publishing a complete index to our fifty-two volumes. One contributor thinks we might depend on the voluntary help of our readers in compiling such an index, and on their purchasing it when published. Results, however—most of our readers know very well that our journalistic experiences are not confined to the BUILDING NEWS—are not favourable to such conclusions, and we do not see our way to publish such an index. One valued correspondent, who is bitten with this index idea, wants us to publish it two pages at a time, at the expense, if necessary, of two pages of our illustrations. We are sure the large majority would not thank us for adopting his suggestion. Another wants us to devote much more space to archæology, especially for the benefit of readers who are members of the principal archæological societies. We *do* give space to archæological matters, so far as they affect architecture; in time past we have given more, but it attracted little recognition and less courtesy from the archæological societies, which seem to us—with the exception of the Society of Antiquaries, which does good, sound work—merely to touch the fringe of archæology, and year by year to degenerate more and more into amiable organisations for the arrangement of pleasant outings; so we fear we cannot do much in this direction. Several other readers want us to restore the weekly lists of prices of materials that used to appear after the tenders. We discontinued these with regret, but solely because prices—of timber especially—vary so frequently in different parts of the kingdom, that they gave more dissatisfaction than they did good, and for the same reason we do not see our way to resume them. Very many readers urge us to give more constructional details, especially of ordinary buildings, such as factories, mills, farms, sewerage schemes, and civil engineering works. We can only say we should be delighted to do so, if people would send them. We would gladly give six pages more illustrations weekly, devoted to such practical details, in addition to those we already publish; but the fact is they don't reach us—partly because drawings are seldom made for such works, and partly because some architects are a little chary in parting with such information. Our first question to an unknown correspondent who is good enough to offer us a subject for illustration generally is: "Is it a church or house? Because if so it must be something good to secure a place among the hundreds of proofs of similar works that are already in our drawers waiting their turn to appear; if it is a factory, or a mill, send it along at once." It is *our* business, of course, to obtain and to be first in the field with illustrations of really first-class and national buildings, with the aid of their authors—never yet, we are proud to say, refused us by a single architect of any character or position—but we cannot possibly be aware of the execution of thousands of private commercial and manufacturing buildings, the details of which it would be most desirable to illustrate, if only the architects thereof would send them. We are a little disappointed to find that one comparatively recent innovation apparently meets with little approval. We have for the past three years, and this year to a larger extent than ever, devoted part of our space to illustrations of the principal pictures and sculpture of the year at the Royal Academy and elsewhere. We are able to reproduce these in a manner which few other publications published at the price of the BUILDING NEWS can equal, and we thought the majority of our readers would welcome a yearly record of the best examples of the year's art. If the large number of recommendations to us this week to give fewer pictures and to stick to architecture is a criterion of the opinion of the great mass of our readers, we have for once erred. In all probability, we shall reconsider the matter another year, and, in the meantime, any expressions of approval or disapproval would be welcome, and would influence our decision.

We award the prize in connection with our request for "Suggestions" to "Action." We do not print any paper—we have fairly summarised above the many recommendations that have reached us; the grains of golden counsel we keep for our future guidance, and we offer our best thanks to very many correspondents for their kindly words in acknowledgment of our past efforts.

We now invite all readers to name

THE LEADING LIVING BRITISH ARCHITECT,

With a prize of One Guinea to the sender of the best short appreciative monograph of his work. To make our meaning clear—Suppose five hundred readers compete, and 250 name Brown, 100 Jones, 80 Smith, and 70 Robinson as the first living architect, the prize will go to the one among the 250 who gives the best appreciative short account of Brown's works. To be sent in by Friday, July 1.

A further prize of One Guinea is offered for the best series of

HINTS ON ARCHITECTURAL DRAUGHTSMANSHIP,

to be sent in by Friday, July 8.

And another prize of One Guinea for the best

SUGGESTIONS TO ARCHITECTURAL SOCIETIES

for sessional papers next year, with hints as to subjects most appreciated by members, illustrated, if desirable, by references to and comparisons with past papers.

To be sent in by Friday, July 15.

CHIPS.

At Barrow, on Wednesday, a statue of the Queen was placed in a prominent position in a niche in front of the new Town Hall. The hall, which has been erected at a cost of nearly £60,000, from plans by Mr. W. H. Lynn, R.H.A., of Belfast, will be formally opened on the 14th inst. by Lord Hartington.

The Bishop of Rochester, on Saturday, consecrated St. Bartholomew's Church, Barkworth-road, Rotherhithe New-road. The church is in the Early English style of architecture, and has been erected at a cost of £7,500. Mr. Taprell Allen, of Southampton-street, Strand, was the architect.

Probate has been granted of the will of Mr. Samuel Cousins, late of Camden-square, Regent's Park, R.A., who died on the 7th ult. He bequeaths to the Artists' Orphan Fund and the Artists' General Benevolent Institute, £5,000, and to the Artists' Benevolent Fund £1,000. The personalty has been declared at £112,367.

A fire occurred on Thursday night at Messrs. Aveling and Porter's engineering works at Strood, near Rochester, by which considerable damage was done to the engine house, casting foundry, and machinery.

WAYSIDE NOTES.

THE last great competition is over. Few persons will differ from the opinion of the judges. All, however, will feel a sense of disappointment at the resultant mass of architectural design produced, although the general standard of the work submitted is decidedly above the average. As regards the selected design, Mr. Collcutt's architecture, while very original, is extremely light, and lacks that monumental character which one feels should be stamped upon the new building. So light and fanciful, indeed, is the design, that it is probable that, executed solely in stone, it will look somewhat tame in parts. The peculiar architecture would seem to demand a realisation in red brick and buff terracotta, similar to the author's excellent building in Oxford-street, as many of the forms shown (both constructional and artistic) are wholly out of sympathy with the true principles of old stone architecture. Good draughtsmanship has again been victorious, though, of course, this has nothing to do with Mr. Collcutt's excellent plan and merited reward.

The central portion of the façade of the selected design is a pleasingly original composition; but the immediate extensions at each side strike one as rather commonplace, and suggestive of desirable residential chambers, or similar buildings. The outline is not over pleasing, though there is nothing particularly wrong in it. The detail is magnificently drawn. On the whole, the decision of the judges will be seconded by the profession. Most probably the building will find little sympathy with the general public.

Probably the most dignified design is that of Messrs. Deane, of Dublin, though this seems to lack originality in detail. It is finely conceived, however—rather too much so, as it is altogether too costly and extensive on plan. If it had been carried out as shown, the authors should have felt themselves bound in honour to forward a honorarium by way of royalty to the lineal descendants of Sir Christopher Wren, as the drum and dome of their design are evidently slightly altered models of those at St. Paul's. The conical brick kiln which supports the lantern in the latter building is slightly domed by Messrs. Deane—a doubtful improvement in construction.

There are no designs in any way founded on Grecian architectural principles. Messrs. Deane's details are distinctly Roman in origin. The arch rules supreme in most designs, and one misses any attempt at purely trabeated architecture, such as would have been very suitable on this occasion. But, having regard to the proposed situation of the building, Mr. Collcutt's style must be regarded as eminently suitable, especially if executed in brick and terracotta, as it would then harmonise with the group of buildings formed by the Natural History Museum, Kensington Art Schools, Albert Hall, and Technical Institute.

When I visited the exhibition of the designs at Kensington there was great bustle and activity on the site of the future building: men hammering and sawing as if they had caught the fevered haste of the Institute Committee; great preparations in the way of timber stands were being made; vast sheds of timber, covered with sailcloth, were being erected; workmen hurrying about in all directions, and a general air of brisk business on the site of the late Colonial and Indian Exhibition. A fire-engine with steam up was ready in case of emergency—a very necessary precaution considering the highly inflammable nature of the sheds that are being put up for the accommodation of the sightseers at the coming ceremony of laying the foundation stone. This stone, of colonial granite, merits some respect, since it has the importance that accrues from a weight of somewhat over four tons.

More royalty has favoured the new People's Palace, one of the many kings present in London in the Jubilee week having laid the foundation-stone of some further buildings in connection with this institution. All these ceremonies that have happened for some time past will doubtless be eclipsed in splendour by the affair on the 4th inst.

The Directors of the Scarborough Constitutional Club have extended the time allowed for preparing designs for their new building. Competitors need not now send in their drawings till the 29th of July. This extending of time in competitions is a practice not to be in any way encouraged, as it often puts the procrastinating competitor on the same footing as his more energetic *confrère*. The man who has promptly set to work on his drawings on receiving the instructions has little or no advantage over those who habitually put off work to the last minute, and have a rush and scramble to get their plans finished in time.

Another discovery at Winchester. We seem now to be constantly hearing of some curious find in this city. This time it is the receptacle of the heart of Bishop Nicholas of Ely (1279). It is gratifying to one's sentimental feelings to learn that the pewter case containing the heart was not uncovered, but reinterred after drawings of it had been made by a Mr. Bargent. No mean personage was this Bishop Nicholas of Ely, as we hear that he was Lord Chancellor and Lord High Treasurer of England before he was made Bishop of Winchester.

Remembering the unpleasant state of the river, so noticeable on the 21st ult., it is satisfactory to learn that the new Thames By-laws, sanctioned by an order in Council, prohibit the casting or suffering to flow into the river, or on the banks or tow-paths, any sewage, rubbish, or other offensive matters. This is only as it should be, and especially at this time, when so many persons live for a few days on the river in house-boats. Henley Regatta sees a whole fleet of these boats every year. I presume this new law only applies to what is known as the Upper Thames. Below London Bridge any attempt to sweeten the waters is quite hopeless under the present arrangements, as anybody can find out who journeys down the river either to Gravesend or Australia. The first two hours of such a voyage is not at all cheering. I have not been down the river for some years, but plainly remember that upon the last occasion our steamer churned up a nasty-looking and offensive-smelling foam.

It is reported that the Parisian journal, the *Matin*, in its issue of the 27th ult., besides endeavouring to revive the old claim against England of the modest sum of £20,000,000, also states that our Buckingham Palace was "restored" with French money. My knowledge of history generally, and that of Buckingham Palace in particular, is not sufficiently deep to warrant my offering an opinion on this subject. The Palace itself, however, is of great interest just now. Many views and descriptions have lately been published of the building. The *Graphic* of last week has a very good illustrated article on the place. The writer describes the structures that have occupied the ground prior to the present building by Nash, who appears to have had considerable difficulty with the King (or, rather, Prince Regent) at the time in coming to a decision as to the best way of adding to the old structure.

Previous to Buckingham Palace there seem to have been buildings on the spot at different times called respectively "Goring House," "Arlington House," and "Buckingham House." The first, built by Sir George Goring, afterwards Earl of Norwich, is described by Evelyn as "ill-built, but capable of being made a pretty villa." This edifice afterwards came into the hands of the Earl of Arlington. It was destroyed by fire about the year 1674. The earl thereupon erected a new building—"Arlington" House—which was described by a contemporary writer as "a most neat box, and sweetly seated amongst gardens, besides the prospect of the park and adjoining fields."

The *Graphic* gives a little view of this house—a building with two wings and a simple cupola in the centre. Many doubtless would agree with the old chronicler and dub it a "neat box," and that is all. To some, however, it might appear to be a very pleasing example of unadorned composition, and of quiet and gentlemanly appearance, being plain and unpretentious. At any rate, it would seem to be infinitely better architecture than the incongruous building that succeeded it, which had neither rhyme nor reason in its mass and outline, but appears to have had a skyline composed chiefly of the effigies of half-a-dozen nude personages executing a war-dance on the top of the balustrade.

This new building was erected (1703-5) by the Duke of Buckingham, who ultimately came into possession of Arlington House, which he apparently razed to the ground. His architect was said to have been a "learned and ingenious" Dutchman. Buckingham House was added to and altered, but substantially remained up till Nash's time, and, in fact, it would appear that parts of it are now incorporated in his building.

Nash was undoubtedly heavily handicapped in preparing a design for the new Palace. Indeed, as Mr. D. C. Bell says in the article in the *Graphic*, "it is but doing justice to Nash, judging by the elegant and skilful arrangement of the new rooms above, to say that if he had not at the outset been cramped by the dimensions and level of the original building, he would have produced a more creditable general result." Nash's difficulty with his kingly client was much the same as every architect feels at times more or less—he was not allowed to pull down *in toto* the old buildings. Every house owner has an exaggerated notion of the worth of an old building, and seldom can be convinced of the greater economy of building anew than of patching and adding to the old work. GOTH.

THE NEW ROYAL INFIRMARY, LIVERPOOL.

[WITH LITHOGRAPHIC ILLUSTRATION.]

THE existing buildings of the Liverpool Royal Infimary having become altogether inadequate to meet the growing needs of the City, the governors have decided to erect a new structure on the same spot from plans by Mr. Alfred Waterhouse, R.A., of whose design we give illustrations to-day. Of course, it became necessary to add considerably to the present very restricted site, and this has been done by absorbing the narrow street called "Pembroke-gardens," and purchasing a large strip to the north of it.

Were it not for certain blocks of houses at the N.W. and N.E. angles, which it was found unnecessary to acquire, the enlarged site would cover the whole space between Pembroke-place on the north, Dover-street to the south, Ashton-street on the east, and Brownlow-street to the west. Advantage has been taken of the 184ft. frontage to Pembroke-place between these blocks of unacquired property, &c., occupying approximately the centre of the northern side to place the administrative block at this point. This at once strikes the keynote to the general arrangement of the building, which will best be comprehended by a glance at the two plans, which we give in addition to the perspective view.

The administrative block is thus apportioned: The basement to wine, beer, and coal storage; the ground floor to the administrative offices; the first floor to private rooms for the officers of the staff; the second floor to nurses' and lady superintendents' rooms; the third floor to maids' cubicles; and the fourth and uppermost floor to the kitchens and their adjuncts. Of these floors only the ground and fourth have a completely covered communication with the main building, though, from a point on the staircase midway between the first and second, there is an open-air connection with the first floor of the central ward block.

Passing now to the main building, it will be seen that the wards are arranged in six blocks—three to the north and three to the south of a main corridor running east and west. At the junction of this corridor, with the one running north to the administrative block, is placed the principal staircase, with a clear width of 7ft. 6in. for each flight, and the two principal lifts—one for passengers, large enough to take a stretcher with its attendants, and another for service purposes.

The wards of the first floor are intended for females exclusively, and those of the second floor for males only. The oblong wards to the S.E. and S.W., which on the second floor take 32 beds each, are on the first floor curtailed to give space for small pay-wards and rooms for sick nurses in the S.E., and for operation rooms in connection with the "Thornton" or obstetric ward in the S.W. block. The Thornton ward block has two small theatres attached to it, while all the wards have a scullery (or dirty room), a sister's room, a doctor's room, a separation room for two beds, a dining or convalescent room, and a receptacle for patients' clothes. A lecture theatre below, and an operating theatre (with top light) above, are placed between the north-east and north central wards.

The outpatients are ministered to on the ground-floor of the north central block, and have their own independent entrance from Pembroke-place. The arrangements of this department, as well as those of the laundry, *post mortem*, and mortuary buildings will be sufficiently explained by the plans. To the south of the laundry buildings the existing nurses' home has been retained, while a new covered way gives it a sheltered communication with the end of the main corridor.

The chapel is at the west end of the main ground-floor corridor, and a large recreation hall on the same floor is managed underneath the south central ward. A great variety of other accommodation will be found by a reference to the plans. The wards are supplied from the kitchens of the administrative block by means of trucks upon a railway running through the roof to a service room on the third floor of the main building and at the head of the service lift.

It is intended that the buildings shall be erected of local grey brick, with dressings of red terracctta and red Ruabon brick, the roofs being covered with Westmoreland slates. Glazed bricks will be largely used for the internal wall surfaces, and steam heating will be adopted in conjunction with open fireplaces. The total number of patients' beds is 290.

A MODEL HOUSE FOR £620.

IF there is one characteristic more conspicuous than another among the *soi-disant* pioneers of what is termed "high art," it is an eminently keen sense of money's value. Under the cover of a pretence to abhor all that pertains to mundane interests—"spurning the secrets of the world's machine, and what the rights of man may mean," as "doom'd, pompous and absurd"—they frequently display an appreciation of the main chance which may well suggest a useful lesson to those of "that shouldering herd"* whose fate it is to live by the commonplace. We are not surprised, therefore, at the prominence given to the above amount of money as the sum for which the "Model House" illustrated in the July number of the Century Art Guild's "Hobby Horse" can be built. A suburban house, with a drawing-room 31ft. by 29ft., a dining-room 28ft. by 22ft., and a kitchen 27ft. by 22ft., with an arcaded hall, open porch, w.c., pantry, and scullery, with bedrooms to match, for £620! surely surpasses the ingenuity of the most bare-faced speculating builder. Cubed up, this masterpiece works out for this amount exactly at 2½d. a foot! and the following is the description which accompanies the design: "It is an endeavour to introduce a certain dignity of treatment and interest of detail into a class of houses which has been hitherto left to the suburban builder to run up as insufficiently and vulgarly as the genius of commercialism is able." All this, of course, in plain English, is mere bunkum; for the design is as twopenny-halfpenny as the estimate—in fact, nothing could be more puerile and absurd, or elementarily crude, notwithstanding the assurance with which the description closes: "In this building, imperfect as it is, it may be seen how practical is the principle of the unity of the arts, and how easy it is to introduce colour and sculpture into the simplest architecture." This delicate allusion to sculpture has reference to two statues which are carried on two projecting piers in the front façade dividing the structure into three, and having, by way of a niche-like effect, a Classic cornice broken round over them without any visible means of support. The "harmony of colour" referred to is thus

* Matthew Arnold, in the same number of the "Hobby Horse."

explained:—"To make the house warmer and to prevent the absorption of wet, the brick walls are coated with cement rough-cast. This tinted to a pleasant yellow, makes an agreeable harmony with terracotta and white mouldings." "This frank treatment of the construction" of thin walls and intermediate piers "produces a pleasant effect in elevation." Taking briefly the plan first, we have a long porch, colonnaded with a series of five Doric columns, leading at the back of the house into a vestibule looking under the stairs. From the hall, the scullery copper ends the vista, and as the draught from the back door to the front is as perfect as can be insured, a good wholesome odour from the aforesaid copper may confidently be relied on. The w.c. opens from the first step of the main staircase, from which it is entered two steps down, while next to this necessary apartment is situated the pantry. There is neither light nor ventilation to the service lobby of the kitchen, and all food for consumption in the dining-room must be brought into the hall in front of the entrance. The staircase window is so placed that only the upper half of it would light the stairs, the remainder being hidden behind it. This is a mere detail, and like the other points mentioned, need only be considered by "the shouldering herd" of commonplace architects. "The Century Guild lays stress upon the fact that all art makes for the needs of an entire people, and more particularly does it recognise this fact in the case of architecture." Of the elevations of the precious "model" "design" we need only say that the house is simply an elongated parallelogram with square windows and a low-pitched, hipped roof, behind a solid parapet, which in perspective would hide it entirely. There is a bell-cote in the centre, and two low chimney-stacks about 3ft. high above the ridge. The first-floor windows are about 4ft. from the floor, and the scullery copper has no chimney to it. "The special aim of the Guild is to bring architecture within the reach of all," says the letter-press with this design. We need add no more, save to remark that the house would cost about £1,500 at the least.

PRIZES FOR ART-WORKMEN.

THE Council of the Society of Arts have determined, on the recommendation of the Committee of the Applied Art Section, to offer prizes to art-workmen in certain classes of art-workmanship. These prizes will be awarded to workmen only, and the work must have been executed in the United Kingdom or its dependencies.

The objects submitted for competition may be the work of one workman, or of several workmen working in combination. They need not necessarily be the property of the workman or workmen sending them in. Manufacturers or employers may exhibit articles on behalf of their workmen. In this case, besides the name of the manufacturer, the names must be given of all the workmen who have executed portions of the work, with a statement of the portion executed by each. If any prizes are awarded they will be given to the workmen, and a certificate, enumerating the award or awards, will be given to the manufacturer.

The objects in each class may be:—(i.) Copies of existing works; (ii.) Modifications of existing works; and (iii.) Original works.

In awarding the prizes, the judges will take into account the following points:—1. Originality or beauty of design; 2 Fitness of treatment; 3. Excellence of workmanship.

Before the award of prizes is finally made the candidates must be prepared, if called upon, to satisfy the Council of their competency.

The works will remain the property of the competitor, or of the person from whom he has borrowed them for the competition.

Prices may be attached to articles sent in and sales made, and no charge will be made in respect of any such sales.

All the prizes are open to male and female competitors on equal terms.

When two or more workmen combine in the production of any article sent in for competition, the names of, and the respective parts taken by, each must be specified when the article is sent in, and the proportions must be stated in which they may have agreed, if successful, to divide any prize which may be awarded.

All articles for competition must be sent in to the Society's House in John-street, Adelphi, W.C., on or before Saturday, 3rd December, 1887, and must be delivered free of all charges. Each work sent in competition must be marked with the workman's name, or that of the manufacturer, or, if preferred, with a cypher, accompanied by a sealed envelope, giving the name and address of the workman or manufacturer. With the articles a description for insertion in the catalogue should be sent. The works will be exhibited at the Society's House, or, if the necessary arrangements can be made, at the South Kensington Museum.

The Council reserve the right of withholding any of the specified prizes, or of substituting smaller prizes, or varying in any way their respective amounts. Silver and bronze medals may also be given at the discretion of the judges.

Prizes are offered in the following eight classes for the present year as follows:—

1. Painted glass, £25, £15, £10.
2. Glass-blowing in the Venetian style, £10, £5, £3.
3. Enamelled jewellers' work, £25, £15, £10.
4. Inlays in wood, with ivory, metal, or other material, with or without engraving, £25, £15, £10.
5. Lacquer, applied to the decoration of furniture or small objects, £25, £15, £10.
6. Decorative painting on wood, copper, or other material, applied to furniture and internal decoration, £25, £15, £10.
7. Hand-tool bookbinding, £25, £15, £10.
8. Repoussé and chased work in any metal, £25, £15, £10.

THE ENGINEERS' CLUB OF PHILADELPHIA.

THE Proceedings of this club is of general interest. The annual address of Mr. Washington Jones, the retiring president, whose portrait in phototype adorns this number, deals with railway enterprise and other subjects. Speaking of capital and labour, Mr. President Jones eloquently deals with the problem of how to restore harmonious relation between them. He says: "When returning reason shall awaken the working man to the facts that every man possesses the indefeasible right of free individual action, and that the most intolerable oppression known is the tyranny of a mob; and, on the other side, when employers realise that a larger output and increased returns result from justly remunerated, contented labour, the first milestones on the way to a lasting settlement of the so-called 'labour troubles' will have been passed. The hum of spindles will be silenced by command no more; nor will the forge fire smoulder whilst its master sits in enforced idleness awaiting permission to resume the toil that brings food to wife and eager little ones." Referring to the railway traffic of the United States, the president states that during the past year the total mileage was increased by 8,000 miles, of which about 100 miles in length was laid by the Baltimore and Ohio, from Baltimore to Philadelphia, intended as a link to connect the Reading Railroad and its leased lines through to New York, and another, of longer distance, has been made from Philadelphia up the Schuylkill Valley into the anthracite coal regions. In Kansas also there has been great activity in railway building. Referring to bridges, the president described the Poughkeepsie Bridge, which has been commenced over the Hudson River. It will be of steel, of four spans each, of 525ft. in length. The masonry piers will be carried up 30ft. above the water, and will sustain steel superstructures 135ft. high, upon which the bridge floor will rest. The deck of the bridge will be 55ft. above the floor, and will carry a double railway track, as it will be the only bridge crossing the Hudson below Albany. A new highway bridge is now being constructed over the Schuylkill River, Philadelphia. It is of iron, on the cantilever principle, 550ft. in length, 77ft. in width, resting upon old foundations, except the anchorage or shore piers, which are new; the former are to be rebuilt from low-water level to 8ft. above high water. The river portion will be five lines of single intersection trusses, containing ten double cantilevers and five suspended trusses. The cantilevers are 167ft. in length, 22ft. in depth at piers, and 9ft. at ends, which is also the depth of the suspended trusses. The piers are 215ft. between centres. The shore spans have plate girders 64ft. in length. The roadway is carried on transverse beams covered with buckled plates, upon which is laid asphalte composition and granolithic concrete for footways. A bridge of iron and steel to cross the Harlem River at Tenth Avenue, New York, has a central span to swing, and allow masted vessels to pass. It has a length of 508ft. and a width of 80ft. Water supply is one of the many developments of engineering. In the United States over 250 plants of water supply are now being constructed. One of the largest undertakings of this class is the Amsterdam Water Company at Weesp; the supply is obtained from an outlet of the Rhine to the Zuyder Zee, and the water will be conveyed through a 48in. main about three miles to the pumping station, which is fitted with 10 boilers and two pairs of compound beam engines moving four low-lift and four high-lift plunger and bucket pumps. Each low-lift pump has a capacity of 183,500 gallons per hour, and raises the water into settling reservoirs of 18,000,000 gallons; from these it passes through filter beds into a series of covered reservoirs, from which it is taken by the high-lift pumps (capacity 161,300 gallons per hour), and forced into stand pipes against a total head of 230ft. There is a double system of delivery, one set of mains 2ft. diameter, seven miles long, delivering to domestic users, another set of larger mains to deliver river water to manufacturers. There are 120 miles of distributing pipes, and it is stated that no fewer than 100 canals must be passed under by them.

Other works of engineering that are reviewed have already been described. The Panama and Manchester Ship Canal street railways, electric motive power for railway cars, cable railways, and other new branches of municipal engineering are made the subjects of remark, but are of less interest to our readers.

CHIPS.

A somewhat novel case in connection with buildings is reported as likely soon to occupy our courts of justice. A barrister, who had persuaded his landlord to reroof his house, claims compensation and redress because his quiet enjoyment of the premises has been impaired by reason of the building operations.

On the 21st ult. the foundation stone of the new Victoria Hospital, at Bournemouth, was laid amid great rejoicings. The estimated cost of the building is £7,000.

The Mayor of Lancaster has commissioned Mr. Percy Wood, the sculptor, to execute a life-size group in marble of Her Majesty and the late Prince Consort for the fine-art gallery which Sir Thomas Storey is erecting in Lancaster, together with a scientific institute, library, and reading-room, at his own cost.

The blinds throughout for the new National Liberal Club have been made and supplied by Messrs. G. A. Williams and Son, of Queen's-road, Bayswater, and have given every satisfaction.

The "Royal Jubilee Wall-Paper," made by Messrs. Jeffrey and Co., of 64, Essex-road, N., was selected for the decoration of the old council chamber of the Guildhall on the occasion of the Corporation Ball, given by the City of London on Coronation Day.

The Bishop of London will consecrate the chancel of Hammersmith new parish church tomorrow (Saturday), July 2. The work has been carried out by Messrs. Chamberlain Bros., from the designs and under the supervision of Mr. H. Roumieu Gough, F.R.I.B.A., at a cost of about £6,000. We hope to give a description of the building in our next issue.

The Adelphi Hotel, at Llandudno, was reopened last week after structural alteration and renovation. Messrs. Morris and Norton, Corporation-street, Birmingham, carried out the contract for decorations and furnishing, and Mr. Richard Conway that for plumbing.

A stained-glass window, erected as a memorial, was dedicated in St. James's Church, Horseley Fields, Wolverhampton, on Sunday. The window is a three-light window, representing respectively figures of Faith, Hope, and Charity, under a crocketed canopy. Mr. Samuel Evans, of West Smethwick, was the artist.

Building Intelligence.

AXBRIDGE.—The grand old parish church of St. John the Baptist, Axbridge, Somerset, was reopened last Friday, 24th ult., after final restoration. The nave and aisles had been restored and reseated in 1879 at a cost of £3,200. The chancel was taken in hand in 1880, when a triple sedilia and piscina were discovered on the south side, and on the north a doorway and small squint, which once opened into a now non-existent priest's chamber. The work now carried to completion comprised the restoration of the chancel aisles and south transept. On taking down a large monument to Mrs. Prowse from before the east window of the south aisle, three small groined niches, remains of a reredos, were discovered. The six-light window of transept has been rebuilt, and the roofs oak panelled, restored, and recovered with lead. A stained-glass window, the gift of Mr. Sidney Hill, of Langford, has been placed in the east end of the church by Messrs. Bell and Sons, of Bristol. The four lights represent respectively the Nativity, Crucifixion, Resurrection, and "Feed my Sheep." New choir stalls of oak upon a surbase of Ham Hill stone have also been placed in the chancel. The work has been carried out at a total cost of about £5,000, by Messrs. Trask and Sons, of Norton, near Ilminster, from designs by Mr. J. D. Sedding, the diocesan architect, and under the direction of Mr. W. Jane as clerk of the works.

NATIONAL GALLERY.—The new series of galleries, together with the grand entrance staircase, at the National Gallery, of which we gave illustrations in our issue of April 29 last, are completed, and will be opened on Monday next. The work has cost about £50,000. The builders of the foundation of the new fabric were Messrs. Mowlem and Co., the second contract for the remainder of the builder's work having been placed in the hands of Messrs. Stephens and Bastow, of Bristol. The whole of the marble work, with the exception of the mosaic floors, has been executed by Messrs. Farmer and Brindley, of Westminster Bridge-road, the mosaic floors having been laid by Messrs. Burke and Co., of Newman-street, Oxford-street, W. The works have been carried out from plans by and under the superintendence of Mr. John Taylor, of H. M. Office of Works. The chief rooms are a new central gallery, measuring 65ft. by 40ft., lighted from the middle of roof by a lantern; a new north gallery, 85ft. by 40ft., the largest and finest apartment in the whole building; and two cabinet rooms, each 30ft. by 20ft.

SOUTH KENSINGTON.—A new parish room, vestries, and morning chapel are being added to St. Stephen's Church, Queen's Gate, from the designs of Mr. Hugh Roumieu Gough. A corner stone was laid by Lady Borthwick on the 23rd inst., and it is expected that the works will be completed in about three months' time. Messrs. Chamberlen Bros., of Hammersmith, are the contractors for the new buildings, which will cost about £1,400.

THE PEOPLE'S PALACE.—The King of the Belgians on Saturday laid the first stone of the library which is to be erected as one of the adjuncts to the People's Palace at Mile End, from plans by Mr. E. R. Robson, F.S.A. The library is to be an octagonal building, and will comfortably seat 500 people. Galleries will run round the interior walls, and the lighting will be almost entirely from the top. It is intended as an appendix to the Queen's Hall, with which it will be connected by two large reading rooms and a conservatory. This new building, when completed, will be the second largest library in London, that of the British Museum alone surpassing it. It will contain both books of reference and of general literature.

The Duke of Westminster has commissioned Mr. Frampton, of Buckingham Palace-road, London, the artist who designed the stained-glass windows in St. Mary's Church Without the Walls, at Chester, opened last week, to design a great west window for St. John's Church in the same city as his jubilee gift to that church. The window is to be historical in subject, illustrating the ecclesiastical history of St. John's.

Engineering Notes.

EDINBURGH.—A new bridge has just been completed on the old Queensferry-road over the Water of Leith at Bells Mills, providing a carriage drive from the west end of Edinburgh to the Queensferry-road. The whole cost of the improvements is from £18,000 to £19,000, of which about £5,000 was spent on compensations. The engineers for the bridge are Messrs. Blyth, Cunningham, and Westland, George-street, and the contractors Messrs. Henderson, Matthews, and Co. About 500 yards from the bridge a new roadway with a rising gradient of 1 in 24 has been constructed within stout retaining walls—varying in thickness from 10ft. at the bottom to 3ft. 6in. at the top. On the south side the wall is broken up, and relieved by an arcading of dressed stones, while on the north side the blind arches are of brick. The river is crossed by a single round-arched bridge of 68ft. span, the piers being carried up 12in. above the castellated parapet. The retaining walls, which have step-breaks, are surmounted by a coping of freestone, while the 5ft. parapet of the bridge has a coping of red granite. The roadway between the parapets is 40ft. in width, the footpaths being each 7ft. It took 12 charges of dynamite to blow the old bridge down, and among the ruins was found the trowel of one of the masons who had originally built the structure. From Palmerston-place a narrow lane has been widened out into a broad street, 60ft. in width, with footpaths on each side. There is still a piece, 20ft. at least in width, opposite Douglas-crescent, as to which terms have not yet been arranged, and which forms an eyesore at present. On the east side the arches have been opened, and are to constitute cellarage for the houses which may be built along that line. The gradient of the road from Palmerston-place is 1 in 13½, and the parapets are finished with stepped caps. The raising of the level of the roadway has also involved the erection of a new lodge and entrance gate to the Dean Cemetery, and the raising of the wall of the Orphan Hospital.

NOTTINGHAM.—The first step towards boring a tunnel under Mapperley Hills, which forms one of the principal portions of the work in connection with the construction of the new Nottingham Suburban Railway, has been taken by sinking a shaft in the hill. The Nottingham Suburban Railway Bill received the Royal Assent on June 25, the share capital has been subscribed, and negotiations with most of the owners of land through which the railway will pass, have been concluded. The proposed line is estimated to cost £215,000. The contract has been let to Mr. J. P. Edwards, of Birmingham, who is at the present time engaged in constructing the Heanor and Ripley extension of the Midland line, and he has undertaken to complete the Nottingham railway within a period of two years.

CHIPS.

The Court of the Carpenters' Company having offered to the Clerks of Works' Association the use of a room in their premises in London Wall for their meetings, the Association have removed their headquarters from 31, Spring-gardens, which has since the formation of the body in 1882 been generously placed at their disposal by Mr. John Oldrid Scott, to Carpenters' Hall.

The Queen will lay the foundation-stone of the equestrian statue of the Prince Consort, the Jubilee offering of the women of England, and a replica of the one at Glasgow, on Thursday week, the 14th inst. The site selected by the Queen is near Smith's lawn in the most picturesque portion of Windsor Great Park, between Cumberland Lodge and Virginia Water.

The foundation stone of a new Established church was laid at South Connel, near Oban, last week. The church will cost £1,300, including fittings and site, and will seat 240 persons. Mr. David Macintosh, of Oban, is the architect, and the contractors are Mr. Roderick Mackenzie for mason work, and Mr. W. Menzies for all other trades.

The Manchester Ship Canal Company have contracted with Mr. T. A. Walker, of Westminster, to complete the canal for a sum which is £561,000 less than the Parliamentary estimates. Mr. Walker will also take, if requested to do so, half a million in ordinary £10 shares as part payment.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

NEWCASTLE SOCIETY OF ANTIQUARIES.—The third country meeting of this society for the season was held on Saturday, at Hexham. The party, under the guidance of Mr. J. P. Gibson and Mr. C. C. Hodges, visited the Abbey Church. On arriving at the church, Dr. Bruce remarked that they were in the "Heart of all England," an extremely pretty place, a fruitful land, a likely situation to be occupied by the Ancient Britons. He also conceived it was occupied by the Romans, it was just the sort of place they would take possession of. Then they had this grand sanctuary — the Abbey Church, one of the best specimens of Early English in all England. The workmen who built these grand edifices must have been men of great skill, as they had apparently gone to work without any elaborate detailed drawings. Mr. C. C. Hodges read a paper on Hexham, in which he expressed the opinion that Hexham was not the site of a Roman station, and that the Roman stones found at Hexham had been brought from the neighbouring Roman station of Corstopitum (Corbridge), which outshone in splendour any other Roman city in Northumberland. Referring to the Roman altar and other worked stones taken from the bed of the river Tyne a few days previously, Mr. Hodges suggested that the carters in carting Roman stones from Corbridge to be used in the building of the church at Hexham, had had the cart upset in the river, and had not been at the trouble to get the stones out of the water again, but had returned for another load. At any rate, judging from the wear of the water upon the stones, they seemed to have lain in the river for many centuries. Mr. Hodges exhibited views of what the abbey and monastic buildings were like a century and a half ago, and the party were conducted over the church, the crypt, the cloisters, the chapter house, and shown those portions of the old monastic buildings which still remain.

THE SOCIETY OF ARTS.—The annual meeting of the Society of Arts, concluding the 133rd session of its history, was held on Wednesday in the great hall of its house, John-street, Adelphi. The report, which was read by the secretary, Mr. H. Truman Wood, was adopted. Having enumerated the papers read and the lectures delivered during the session, the report stated that prizes to the amount of £368 had been offered for competition to art workmen for articles to be sent in next December. Prizes for the best motors for electric lighting had also been offered to practical students in that important branch of investigation. Among other matters mentioned in the report were the presentation of the Albert Medal to Her Majesty in recognition of the progress made in arts, manufactures, and commerce during her reign, and the erection of a memorial tablet on the house of the late Mr. W. M. Thackeray. The income of the society during the past year amounted to £12,575. The result of the balloting for the election of officers was announced. The Prince of Wales was re-elected president, and among the vice-presidents were the Duke of Edinburgh, Prince Albert Victor, Sir Frederick Abel, the Duke of Abercorn, the Attorney-General, Sir Edward Birkbeck, Sir Frederick Bramwell, Sir Philip Cunliffe-Owen, Sir Douglas Galton, the Duke of Manchester, Sir Henry Ponsonby, and Lord Thurlow.

The ceremony of turning the first sod on the site of the proposed Dartmouth Park Extension Pool was performed at West Bromwich by Earl Dartmouth on Saturday afternoon. Lord Dartmoth gave the original park to the town eight years since, and has now presented an additional piece of land containing nine acres, which will be laid out as a boating lake. Mr. Jeavons is the contractor for making the pool.

Mr. Cosmo Innes, M.Inst.C.E., Secretary of the London Sanitary Protection Association, died on the 18th inst., at 11, Upper Phillimore-gardens, aged 45. Mr. Innes was the youngest son of the late Cosmo Innes, Professor of History in Edinburgh University.

The whole of the officers and men engaged by the Corporation of Droitwich in the gas, water, and sewerage departments were entertained by the borough surveyor, Mr. C. Hendon, C.E., at his residence on Saturday evening. The Mayor presided.

ARCHÆOLOGICAL.

STRATA FLORIDA ABBEY.—The ruins of this ancient abbey are now being excavated by Mr. Stephen W. Williams, F.R.I.B.A., Rhayader, Radnorshire, who is about to contribute a paper thereon to the next annual meeting of the Cambrian Archæological Society. Strata Florida Abbey is situated in a remote part of Cardiganshire, and was founded in 1076 by Rhys ap Tewdwr, and in 1164 further endowed and enlarged by Rhys ap Griffiths, Princes of South Wales. In 1281 it was burnt down during the wars between Edward I. and the Welsh, and subsequently rebuilt. It appears to have flourished until the dissolution of the monasteries in the reign of Henry VIII., when it gradually fell into ruin, and all that now remains above ground is a fragment of the north transept wall, a portion of the west wall of the nave, with the great western doorway and the west window of the south aisle. Mr. Williams has already uncovered most of the foundations of the abbey church so as to ascertain with accuracy the plan of the building, and during the progress of excavation has discovered many interesting fragments of moulded stonework, encaustic and glazed tile pavements, the piers of the nave, the piers of the great central tower, and the eastern chapels of the north and south transepts. It is hoped that funds will be forthcoming to clear the entire area, as there is little doubt if this were done that many more interesting facts will be elucidated, as it was for several centuries the burial place of the princes of Wales, and may, indeed, be called "The Westminster Abbey of Wales."

COMPETITIONS.

PROPOSED HIGH SCHOOL FOR HARTLEPOOL.—A special meeting of the governors of Henry Smith's charity was held on the 27th inst. in the Council Chamber, Hartlepool, the Mayor presiding, to consider the question of the plans of the proposed new High School in connection with the Trust. The Charity Commissioners had written that the plans submitted were not sufficiently detailed, the plans being those marked "Rover," and selected by the Board on condition of their being approved by the Charity Commissioners. In reply to Mr. Wood, the clerk gave it as his opinion that there was no contract binding on either the Board's or the architect's side, as the agreement stipulated that the commissioners were to give their approval. The Mayor thought that a proper course would be to call in the services of a first-class architect, and tell him exactly what they wanted, and ask for an estimate of cost. Mr. Wood supported this view. Mr. Henry Belk moved, that seeing the plans marked "Rover" had failed to receive the consent of the commissioners, they be not accepted by the Board. Mr. Nielson seconded, and this was carried. A discussion then arose on the Mayor's suggestion of calling in an architect, when it was agreed that a committee should consult Mr. G. G. Hoskins, of Darlington, relative to plans and specifications for the proposed High School.

THE GLASGOW INTERNATIONAL EXHIBITION.—At a meeting of the Printing and Advertising Committee, held on Tuesday, the premium of £15 for a design for a poster was unanimously awarded to the sketch bearing the motto "Legibility." The author is Mr. Harry C. Mitchell, 2, Baxter-place, Edinburgh. The design shows a figure with outstretched arm representing the advance of civilisation, overlooking the Glasgow Bridge and part of the river Clyde, with a distant view of the city. Below the figure, which is in the right-hand corner of the poster, there is the Glasgow coat of arms. Thirty-one designs were submitted to the committee.

The foundation-stone of the enlarged parish church of St. Peter's-at-Gowts, Lincoln, was laid on Tuesday week. Mr. C. Hodgson Fowler, F.S.A., of Durham, is the architect. Mr. H. S. Close, of Lincoln, has taken the contract for masonry, and Mr. S. Barker, of the latter city, for joinery. The cost will be about £1,800.

A bust of the Queen by Mr. Boehm, R.A., mounted on an oak pedestal, was unveiled at Chelsea Hospital on Monday by the Duke of Cambridge.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

"BUILDING NEWS" DESIGNING CLUB.

NINTH LIST OF SUBJECTS.

R.—A small country vicarage in brick and stone, with tile roofs. Study (12ft. × 13ft.) to have a waiting lobby adjoining, with a separate porch for persons calling on the priest. House to have a drawing-room 18ft. by 14ft., dining-room 20ft. by 15ft., six bedrooms, bath-room, one dressing-room, and w.c. on both floors. A back staircase to be provided. Scale 8ft. to the inch. Two plans, one elevation, and section (or two elevations), and perspective sketch.

S.—A cricket pavilion for a private club. Club-room to be 22ft. long by 16ft. wide, with a raised gallery over it for ladies. In front a terrace, with seats for 200 persons, is to be provided, and a verandah the whole length of the club-room, and 10ft. wide, is to be contrived. A refreshment-bar is to be situated at one end of the club-room on the ground floor, and at the other end a committee-room is to be placed. Over the latter are to be two dressing-rooms for members, with lavatory, urinal, and w.c., reached by a stair out of the entrance-lobby, and over the bar a ladies' retiring-room, with lavatory and two w.c.'s, are to be arranged. These may be reached from the gallery staircase landing. A players' terrace is to occupy the front of the committee-room. Building to be in half-timber on a brick base. Scale, 8ft. to the inch; elevation, two plans and sketch.

(This list is the last of our present series.)

DRAWINGS RECEIVED.—"Protoplasmic Globule," "Suum Cuique," "Clair," "Half-and-Half," "En Avant," "Truth," "Hand in Hand," "Gereon," "Northumberland," "Stag," "Toujours Pret," "Eton," "Elean," "Oxon," "Loidis," "Norseman," "Dunedin," "Cancer," "V. R.," "Vitruvius," "Barum."

Correspondence.

DESIDERATA.

To the Editor of the BUILDING NEWS.

SIR,—As an appendix to Mr. Edwards's valuable suggestions in your last number, would you allow me to say that a series of "Plans of country houses," by acknowledged masters of the subject, would be invaluable to the ordinary practitioner. I believe that the late Mr. Burn was considered an adept at planning a mansion, and if a set of papers could be written on the subject, illustrated by acknowledged masterpieces of "arrangement," great good would result from it. In my experience many architects can design a suite of "entertaining rooms," but only very few can grasp the requirements of the working part of a country house. So far as my observation has extended, it requires more genius to plan the "service" part of a mansion and the stabling than any other part of it. My remarks refer to "planning," and are not intended to refer to architectural treatment.—I am, &c.,

Chester, June 27. JAMES GOODSON.

ARCHITECTS AND QUANTITY SURVEYORS.

SIR,—I am sorry to hear from "Quantity Surveyor" "that most architects in the present day take out quantities"; I thought that only persons who were not up to much at architecture did so. I do not profess very much knowledge of the matter; my only wish is to see better architecture, and I think this can only be done by men devoting their whole time to it, and not attempting to take out quantities.

When I said that a person could be an architect and surveyor, I meant that he should do such surveyors' work as cannot be properly done by a quantity surveyor "pure and simple."—I am, &c., C. F. M.

WORKMEN'S COTTAGES.

SIR,—The plans of a pair of workmen's cottages which are placed first in the issue of June 17th, are about the worst that could be conceived—from a sanitary point of view.

The larder-door, opening from the scullery and lighted from the washhouse (the latter being superfluous in this class of building, unless used by two or more tenants); the w.c., separated by a thin wall from the kitchen cupboards and under a bedroom; the pump, in an angle of the washhouse (I suppose) is intended to be used on both sides of the wall—a very ingenious arrangement for producing black eyes, if not broken bones.

In the design placed second in the last issue the above objections, with the exception of the w.c., do not apply; but the latter ought always to be outside the main building.—I am, &c.,

JAMES THORNELOE.

ROCHDALE TOWN HALL.

SIR,—In your issue of the 24th inst. a mistake was made in calling me the architect of the Rochdale Town Hall. This must have been merely an inadvertence, as it is very well known that the many beautiful details of that building are due to Mr. Crossland.—I am, &c.,

A. WATERHOUSE.

20, New Cavendish-street, Portland-place, W.
June 28.

THE NEW COINAGE.

SIR,—It seems to me that every art journal should unite in a positive condemnation of the design and execution of these coins. We are flattering ourselves with the progress made in art, knowledge, taste, and mechanical excellence during the last 50 years, and yet this coinage, which is to commemorate through the future her Majesty's Jubilee, is a flat contradiction to what we are crediting ourselves with. Design and execution display childish impotence compared with the work of Pistrucci 60 years ago. Mr. B. may be able to design bulls, but he should let alone bullion.

The ancients, with their clear-sightedness, confined the portraiture to the head as filling well the field, and that is all that is needed. As to the heraldry, the charges are not big enough, and the tinctures of shields should have been shown. But as regards the "reverse," I should like to have got rid of the shields for something more novel, as the head of a trident, with a fish on one side to indicate our oceanic colonies, and a star the other, to remind us of India, with, on the margin, the name or value of the coin. The superscription on the obverse I would have: "Victoria Brittaniæ et Hiberniæ et Coloniorum Regina, atque Indiiæ Imperatrix."

As a gracious Providence has given us mighty colonies and extended empire, it is a ridiculous and culpable false shame not to claim and show forth our honourable position.—I am, &c., M.

Intercommunication.

QUESTIONS.

[9331.]—**Fixing Photos.**—Would you or any of the numerous readers of the BUILDING NEWS inform me of the best paste for fixing photos in albums or on card-board, and also how to prevent the unsightly bulging?—G. H. G.

[9332.]—**Various.**—Will any of your readers be good enough to reply to the following questions?—(1) Which is the best paint for putting on the exterior of a stucco house already painted, and how many coats are required? (2) Which is the most effective outlet ventilator to discharge into flue? (3) Can anything be done (other than relaying the floor entirely) with plain jointed boarding in a dining-room, the joints of which have gaped very considerably? (4) The floor of a porch, composed of stone slabs, has very much worn with the traffic upon it. Would it be possible to hack off an inch or so all over the surface to make it level, and then fill up with mosaic or tiles flush with the stone steps?—A FIVE YEARS' SUBSCRIBER.

[9333.]—**Ventilation and Prevention of Down-draught in Churches.**—I would esteem it a great favour if some practical authorities on the subject of ventilation would give their views in connection with the following matter:—A large Congregational church having galleries along the whole length of two sides of the nave and across the west end, also a number of traceried windows, giving a large cooling glass area round the galleries and a roof of unusual height over nave, is at present causing much speculation as to the reason of the large amount of draughts that sweep down on the heads of the congregation in a most inconvenient and unaccountable manner. So much so does the evil exist that some of the seatholders have left the place, and others threaten to do so unless the defect can be remedied. Many say there is no scientific system of ventilation provided. There are a number of openings certainly, "communicating into the false roof only," and running down the nave at the apex of the Gothic arched open-timbered roof, the line of which the ceiling plastering follows between the spars; but there is no turret or other ventilator with tube connections, and in contact with the openings in question to act as exhausts. Now, my own theory is, first, the old building being so very lofty, provides a large cubical area of cold air in the upper levels, which, for want of a proper system of draw-off or outlet ventilation, becomes displaced and thrown down by the rising current of warmer air when the heating apparatus is turned on (low-pressure hot water); and 2nd, because these down-currents being felt by the congregation so severely during the whole of the Sunday—and this, in face of the fact that the heating apparatus would be in working order on the Saturday—seems to point to the supposition that the heating arrangements are inadequate. And these two evils of want of ventilation and heating power so combine as to provide a nicely-balanced equilibrium of favouring circumstances that would induce and maintain the circulation of air-currents or down-draughts, and which would go on indefinitely unless an equable temperature could be induced by some means. I have no doubt that the case brought forward is but one of many such instances of failure, and the subject is, therefore, one of great importance to the designers of public buildings. With your kind indulgence, I would place the subject before your readers in the hope it may be the means of initiating an interesting discussion and expression of opinion that may prove of value to a large number of your readers. Before closing, I would suggest as a remedy in the case in question (and I do so "merely as an expression of opinion"), first, that a hot-air apparatus be placed in the basement; that two shafts be carried up from same, one to deliver hot-air into the large area comprised in the space between the crown of nave arches and ceilings above, and the other air-shaft to be connected with properly-placed exhaust shafts, distributed along the highest point of ceiling, and thence properly connected to an exhaust turret ventilator at the highest available point of roof. And third, that the heating power be increased in the existing apparatus. I may, I confess, be entirely wrong in my views, and I shall be glad to be corrected if in error, and learn the opinions of others.—REX.

[9334.]—**Extras.**—A. and B. are surveyors who met and measured extras to contract. A. proposes making out his valuation of the extras, based on Laxton's prices, and have the accounts stamped—that is the sheets on which the aggregate amount is made out. B. is not a licensed appraiser. Kindly inform me through the columns of your valuable paper whether the account so made out can be set aside? I may say the object of stamping is to prevent, if possible, any litigation.—SURVEYOR.

[9335.]—**Foundation-Stone.**—Will some reader who knows kindly tell a young architect what he is expected to do at the ceremony of laying a foundation-stone of a new building being erected from his designs? A few hints which would put him in the way of creditably performing his duty on such an occasion would greatly oblige a—JUNIOR.

[9336.]—**Ground Plans of Dominican Monasteries.**—Can any reader favour me with the names of any pre-Reformation Dominican houses in this country, and the usual arrangement of ground-plan in buildings erected for this order?—EAST ANGLIAN.

REPLIES.

[9310].—**Half-Timbered Walls.**—The criticisms of "F. B. P." would have more weight if he had first made himself acquainted with the history of this kind of construction. It so happens that the method proposed by H. Rumble is a much nearer approach to the older and truer style than filling in with brickwork, this latter method being a greater innovation than that of H. R. The old workmen did not fill in brickwork, and if they had done so they would not have plastered it over, for the very simple reason that such a method would be contemptible. If brickwork will keep out the wet, why plaster it? If not, the brickwork is best separated from the plaster, and better still, not to overhang. The sneer about the scene-making plainly shows "F. B. P.'s" practical ignorance, as the cost of the lead is a very small factor in proportion to the total cost.—JAMES THORNELOE.

[9322.]—**Feather-edge Joists.**—I have been away from home, or would have replied to the above question earlier. Feather-edged joists in wood is a subject entirely new, and one consequently worth quietly considering. I am not one who places much reliance on the published tables of tensile and compressive strengths of timber, as they are invariably framed upon selected scantlings, cut from logs or deals grown under circumstances with which we are entirely unacquainted, and wholly irrespective of the weakening influence of knots, which occur invariably in groups of five at intervals of 18in. or 2ft., passing through the volume of longitudinal woody fibres at an angle of about 45° with a rapid increase in size as they approach the outside. This refers more especially to the top end of logs or deals; but, as seen by passing a cut down the heart of the tree, they are more or less present and pronounced in all qualities of fir wood. I mention this detail as having an enormous influence upon wood, and regret that it is practically ignored by all specialists framing tables of the strength of timber. In dealing with the question of feather-edged joists, I do so with well-autheticated tables, as being the best instruments within reach; but they nevertheless are, in my opinion, very imperfect instruments, and in practice a wide margin should be given for contingencies like the above; more especially when tensile strength is under consideration. The late Mr. Thomas Laslett, timber inspector to the Admiralty, furnished very exhaustive tables in his admirable work, "Timber and Timber Trees—Native and Foreign," extracts from which, so far as they bear upon the question at issue, I give below—

EXPERIMENTS ON PIECES 2IN. × 2IN. × 30IN.

	Direct cohesion. lb.	Crushed with. Tons.
Dantzic fir, average of 5 tests	3·231	2·625
Riga fir do. do.	4·051	1·844
Average	3·641	2·234
Equal to	32½cwt.	44⅝cwt.

The tensile experiments are only taken as pieces 30in. long, as being most suitable for holding in the clamps; but the vertical or crushing experiments are taken on a variety of lengths, from which I have selected 2in. × 2in. × 30in., the shorter showing greater power of resisting the crushing load. As the question before us—broadly speaking—is Baltic fir, I have averaged the two shipments of Dantzic and Riga. By this we get a fair average of bearing timbers. The experiments do not extend to Swedish, Finnish, or Russian sawn goods, which, although more suitable for wrought work, are infinitely inferior for joists or timbering purposes. From the above experiments we see that the 2in. × 2in. × 30in. scantling parted with a tensile strain of 32½cwt., and that the same scantling crushed longitudinally with a vertical weight of 44⅝ cwt. This proves that the tensile power is inferior to the compressive powers as 3 to 4, and that if applied in practice to a 12in. × 6in. beam, the lower edge should be 7½in., and the upper edge 4¾in. broad. This is about the result we might anticipate, as it conforms with those of other materials; but there is this to be said, that in the case of wood, in which knots form such a weakening agency, the weakness is only apparent on the lower edge or part in tension, which should be increased in volume at the expense of the part in compression. In answering the above question, I prefer to leave out the detail of tension, as I hold it would be but slightly affected by making the lower edge of a beam or joist broader and the upper edge narrower, the depths and sectional area being undisturbed.—WM. STEVENSON, The Park, Scarborough.

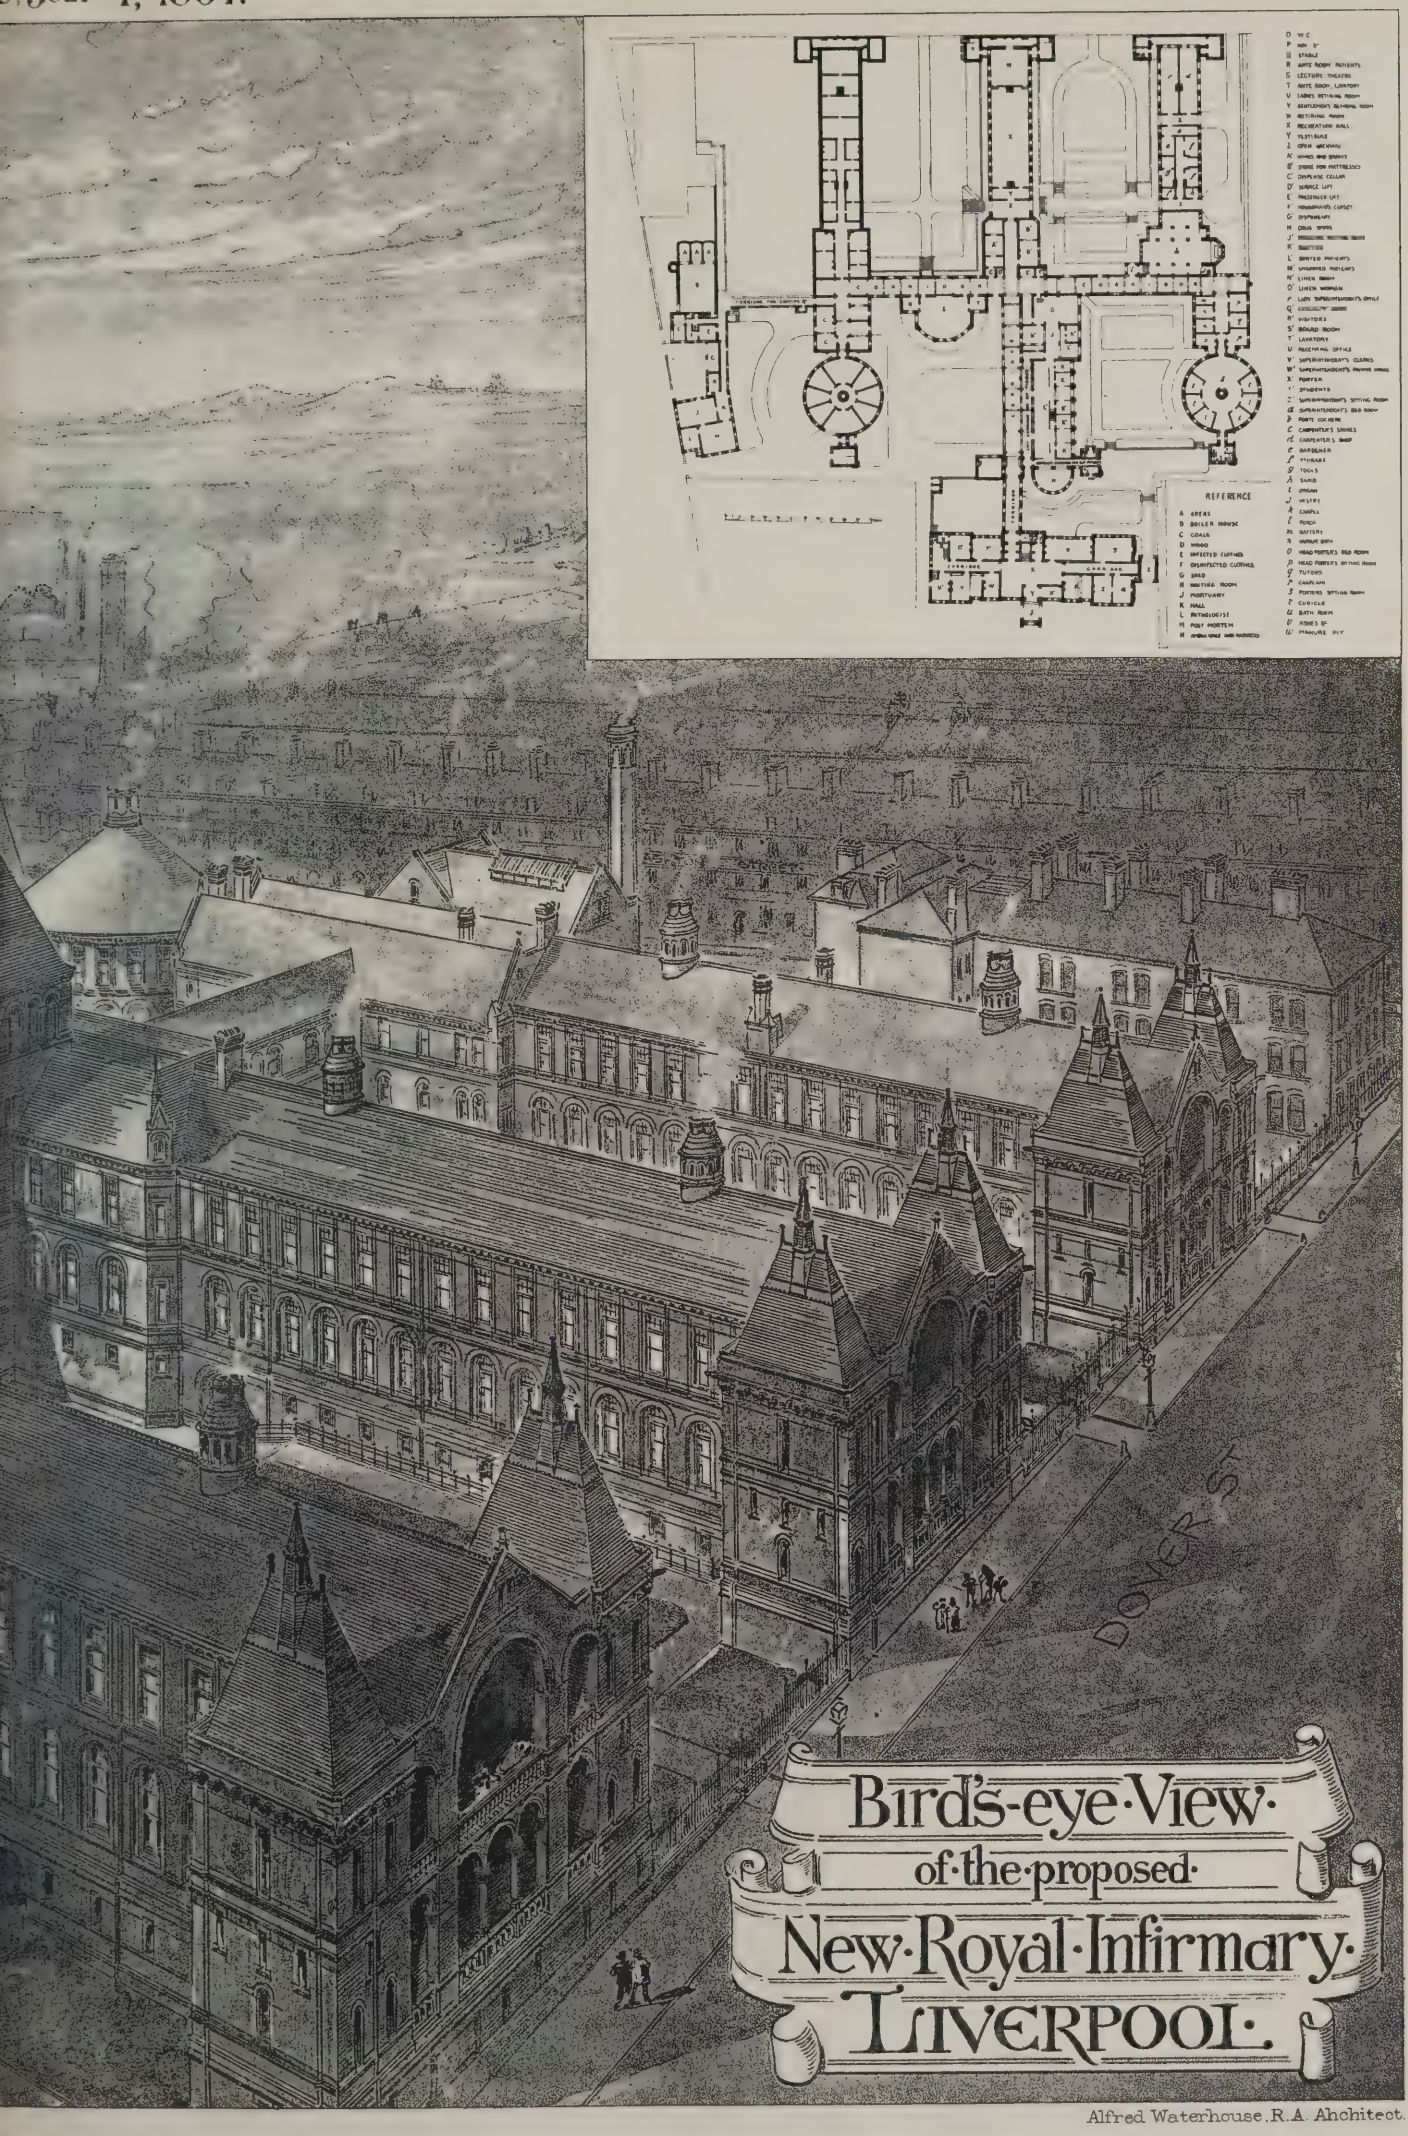
[9328.]—**Surveyors' Examination.**—The subsection of the students' proficiency examination for building comprises the following subjects—Land surveying, levelling and elements of trigonometry, book-keeping, practical measuring (oral exam.), bills of quantities and measurement of artificers' work, constructive and working drawings, elements of law of fixtures, of dilapidations, and law of easement. For surveying, Baker's "Land and Engineering Surveying," or Merritt's work on the same subject may be used; for bills of quantities, &c., I should recommend Leaning's "Quantity Surveying" and "Complete Set of Contract Documents," published at 10s. by E. and F. N. Spon; for the elements of the law of fixtures and easements, read Grady "On Fixtures and Dilapidations," Houldsworth's "Law of Landlord and Tenant," and Innes' "Digest of Easements." Attention should be particularly given to surveying, to the preparation of working drawings and quantities, and the elements of the law bearing on landlord and tenant and easements; how the rights of support, light, and air are acquired, the law as to party structures, Metropolitan Building Act, how these easements are infringed, and the remedies for infringement; Public Health Act, 1875, as to dangerous structures, &c.—G. H. G.

[9330.]—**Legal.**—A stamped agreement ought to be prepared and signed by the contractor as well as the plans and specifications. 2. The clause that any variation made in carrying out the works is not to vitiate the contract is chiefly intended to apply to alterations during the progress of the work, and should be incorporated in the legally-drawn-up contract or agreement. 3. If the "extras" ordered were of such a nature as to require lengthened time, and were mixed up with the original contract work, the employer cannot sue the builder for penalties. The builder is not liable for any damage, if through the act of employer the work is delayed. If there is no legal or stamped agreement it may be desirable to waive the penalty for completion, though circumstances must dictate the proper course to adopt. The written acknowledgment of liability, if made after the extras were all ordered, is the only ground upon which action can be taken.—G. H. G.

The report of Mr. Williams, C.E., on the completion of the outfall works on the river Witham, South Lincolnshire, has just been issued, with a map, in pamphlet form. The total cost of the works has been, including Parliamentary expenses and land, £167,941; and the absolute gain or depression acquired is 4ft. at the Grand Sluice, 4ft. at the Black Sluice, and 5ft. 6in. at the Hobhole Sluice.

LEGAL INTELLIGENCE.

DISTRICT SURVEYORS' FEES.—At Hammersmith Police Court on Tuesday, Charles Bowyer, the owner of two houses in Goldhawk-road, Hammersmith, was summoned to show cause why he refused to pay £3 12s. 9d., claimed by the Metropolitan Board of Works. Mr. Norman Bevan, on behalf of the Board, said £3 formed the fees paid to Mr. Knightly, the district surveyor, for inspecting the houses, which were in a dangerous condition, and the 12s. 9d. was for general expenses. The Act allowed 20s. to the surveyor for each house, but the Board allowed him 15s. in each case. A clerk from the Board's offices was called to prove that the item 12s. 9d. was charged under the decision in the case of the Board v. Flight. A question arose as to whether the Board had the power to charge for general expenses. Mr. Bevan submitted that it was not in the discretion of the magistrate to question the item. He said the Board had absolute power to allow anything they thought proper. Mr. Paget: They may give £1,000? Mr. Bevan: Of course, they would not do it. Mr. Paget: I am not quite sure. The defendant contended that he was not liable, as it was not necessary to take the buildings down, and that the fees were not charged according to Act of Parliament. Mr. Paget said he was with the defendant on the point as to charging the fees according to Act of Parliament. The question was how much the Metropolitan Board were entitled to pay. He should not make any order in respect of the general expenses. He then ordered the defendant to pay 40s., the full amount which the Act allowed, with 2s. costs. His knowledge of the law was better than that of the clerk of the board. Mr. Bevan said the board would not allow the case to rest there.



ACTION AGAINST A COUNTY SURVEYOR.—At the Sessions at Magherafelt, on Wednesday week, a case in which considerable interest was aroused came on before Mr. J. C. Neligan, Q.C., Recorder of Londonderry, and a special jury. The action was brought by Robert Waters, of Allahabad, in India, brigade surgeon, having property in Moneyguiggy, near Tobermore, against A. H. Adair, of Londonderry, county surveyor, and John Hagan, and Francis Hagan, both of Drumdoig, road contractors, to recover £50 damages sustained by reason of defendants having broken and entered plaintiff's lands, in the townland of Moneyguiggy, and pulled up and destroyed a hedge, plaintiff's property, and removed a quantity of thorns, and converted same to their own use. Evidence having been taken, his honour, in addressing the jury, considered no justification had been proved for the pulling up of this hedge, and the only question for them was one of damages. The jury accordingly assessed the damages at £40 against the defendants Adair and Francis Hagan.

CONFESSION OF FORGERY BY A BUILDER.—At Greenwich Police-court on Saturday Arthur Goddard, 45, builder, of 9, Silverdale-buildings, Sydenham, was charged on his own confession with having fraudulently obtained the sum of £250 from Mr. Dale, manager of the Peckham branch of the London and South-Western Bank, by means of a forged lease of two houses known as Montacute and Mandeville, Burghill-road, Sydenham. The prisoner had no reply to make to the charge, and was committed for trial at the Old Bailey Sessions.

IN RE CHARLES H. EVERETT.—This was an application for an order of discharge. The bankrupt had traded as a builder and contractor in Iverson-road, Kilburn, and he owed £15,401, with assets £447. The bankrupt commenced business about 15 years since, and in 1883 a partnership with Mr. J. Ford, which had existed for about seven years, was dissolved, the latter retiring on the receipt of cash and property to the amount of £1,200. The bankrupt estimated the firm's capital at that time at £3,000. He afterwards continued the business, and entered into contracts for railway, drainage, and building works, to losses on which he attributed his failure. About December, 1885, the bankrupt assigned all his property to Mr. Harry Smith, upon an undertaking to arrange with the creditors on the best possible terms. It appeared that Mr. Smith bought up the debts of some of the creditors who were parties to the arrangement, paying them 4s. in the pound, but other creditors received nothing. The Official Receiver reported that the bankrupt had kept certain books (which he described), but they were not such as sufficiently disclosed his business transactions and financial position. It appeared that the immediate cause of the suspension was the taking possession of the bankrupt's plant by the Finchley Local Board. Mr. Registrar Brougham said the only offence alleged against the bankrupt was that his books did not sufficiently disclose his business transactions and financial position, but in this case it was not a very serious one, and as the bankrupt's examination appeared to have been concluded in April, 1886, the order of discharge would be suspended for one month only.

PARLIAMENTARY NOTES.

THE ADMIRALTY AND WAR OFFICE SITES.—In answer to Mr. De Lisle, Mr. Plunket said, on Tuesday night—In the scheme presented by the Committee on the Admiralty and War Office sites, by which it is estimated that portions of the Spring-gardens site to the value of £266,000 will be preserved, provision is made for continuing the Mall in a straight line into Charing-cross with an opening of about 75ft. in width. Such a line obviously must be at a certain angle with the Strand, because the Strand and the Mall do not form one straight line. I cannot give any pledge as to what steps the Government may or may not take in future for securing additional space.

THE CORONATION CHAIR.—Mr. Plunket stated on Friday, in answer to a question, that the old Coronation Chair had not been in any way stained or disfigured, and not the slightest injury had been done to the traces that remained of the ancient gilded work. Misapprehension might have arisen from the circumstance that it was necessary to fit in temporarily some few pieces of tracery which were missing, and to stain these brown to match the colour of the old work. The colour of the old work was not touched, and remained exactly as it was before the ceremony.

STAINED GLASS.

EDINBURGH.—The Lindsay Alexander memorial window has now been completed in the nave of St. Giles' Cathedral, upon the south side and over the font. The window is divided by stone mullions into four compartments in the width, with an upper and lower tier, with tracery all filled with figure work illustrating the life of Moses conforming to the arrangement of Scriptural subjects approved by the St. Giles' Board of Management. The upper groups are in large figures, representing prominently Moses and Aaron amidst the Israelites, delivering the Commandments on Mount Sinai. Four separate groups under these represent the Passage through the Red Sea, Smiting the Rock, the Brazen Serpent, and Moses Viewing the Promised Land. Other selections occur in the tracery, such as the messengers carrying the grapes of Eschol, Moses at the burning bush, two angels holding scrolls inscribed Sinai and Pisgah, and the emblematic Aaron's rod. From an art point of view, this work has a special interest, as it differs from previous windows by the artists, Messrs Ballantine. This is evidently due to recent studies made upon the Continent by Mr. Alexander Ballantine, and also to the influence which the windows by Cottier and Burne-Jones have had in moulding the public taste in the matter of stained-glass decoration. The prevailing dark colours are rich ruby, violet, and slate, which appear in a setting of white and neutral glass. The window indicates a return to older methods of stained-glass production.

CHIPS.

Three more paintings have just been presented to the Art Gallery of the Corporation of London, which adjoins the Guildhall, and is open free every day from 10 till 5 p.m. They are:—1. A painting by Mr. W. Goldsmith, representing "The Thames at Bray," the gift of the Vintners' Company of London; 2. "The Poacher," a painting on panel by E. Bird, the gift of Mr. William Rome; and, 3. "Cymon and Iphigenia," by G. Patten, presented by Sir F. W. Truscott.

A bust of the late Professor W. E. Aytoun, who died in 1865, in white marble, by Park, has just been placed in the Upper Library Hall of Edinburgh University.

The Festiniog local board have resolved to erect a screening house for the purpose of filtering the water supply of the district from Lake Morwynion. The plans, &c., were prepared by Mr. W. G. Owen, the gas and water manager, and the contract for the first portion of the work was given to Mr. R. Hughes, contractor, Blaenau, Festiniog.

Mr. William Watson has been appointed the architect for a proposed new church at Lofthouse, near Wakefield. The church is intended to accommodate 500 persons, is to cost about £3,000, and will be built entirely of stone.

Major Tulloch attended at the Town-hall, Dudley, on Tuesday, to inquire into an application of the town council to borrow £1,500 for street improvements. Mr. Gammage, the borough surveyor, produced the plans, to which no opposition was offered.

The polling of the boroughs of North and South Kensington on the question whether the Free Libraries Act should be adopted has resulted in a declaration in its favour; the figures being, for the adoption 5,630, against 4,112—majority 1,518. It is proposed to erect three buildings, towards the cost of which a large sum of money has already been subscribed.

Our Office Table.

WE regret to hear of the death of Mr. George Barnes Williams, F.R.I.B.A., of Frederick's-place, Old Jewry, E.C., one of the senior members of the profession practising in the City of London, which occurred on Sunday last. Mr. Williams had held the lucrative appointment of district surveyor for Plumstead and Eltham under the Metropolitan Board of Works since 1856, and was also surveyor to the Mercers', Coopers', and Vintners' Companies. One of his later buildings was the block of premises in Cheapside, in Renaissance style, containing the new hall of the Mercers' Company, and occupied on the ground-floor by Messrs. Benetfink. He was formerly in partnership, at the same address, with the late Mr. George Smith, F.S.A., the architect of Old St. Paul's Schools, facing the Cathedral, and of Whittington's Almshouses, Highgate. Mr. Williams joined the Royal Institute of British Architects in 1848 as an Associate, and in 1856 became a Fellow. Some years since he served on the council of that body.

WHEN the City Corporation substituted the late City Architect's commonplace and costly street-refuge for Temple Bar, many persons believed that the stones of the old gate so solemnly numbered would prove as troublesome a white elephant as the columns of old Burlington House. The event has justified the expectation, and after having lain in an obscure rubbish heap near Farringdon-road for seven years, the old materials were given by the Court of Common Council last week to Sir H. B. Meux, who wishes to re-erect them at the entrance to Theobald's Park, Cheshunt. Feeble and ineffectual protests were raised against the proposal by two or three members, and were met by assertions which it is difficult to reconcile; a Mr. Beck said the stones were so broken that it was impossible to reconstruct or preserve them, and the lead had been melted into medals; while, on the other hand, Mr. George Shaw stated that the stones were all numbered, and could be reconstructed without difficulty. It was further asserted that the rebuilding would cost at least £1,700, and the City Fathers, doubtless feeling that the money might be better spent, say, on balls, feasts, or bogus petitions, agreed by a majority of 42 to let Sir Henry Meux have the old stones at his own price.

MR. CHARLES DYBALL, curator of the Walker Art Gallery, who reported on Monday to the Library and Art Committee of the Liverpool Corporation the results of his recent visit to the art exhibition in London, takes a cheerful view of the prospects of artists. He regards the pictorial art of the season as an advance upon the productions of the past few years, while the large number of works which have found purchasers shows that there is still a wide field for artistic effort. He goes to the root of the lamentations heard as to the decline of the demand for pictures in his remark that "although the *furore* for art which obtained a few years since has considerably abated, there seems even now but little difficulty in disposing of really good pictures; such falling off in patronage as exists is felt by those who, relying upon the reputations achieved by former successes, find it difficult to obtain large prices for works which owe their existence more to financial necessities than to artistic endeavours to excel." A glance at the walls of the Royal Academy shows, he thinks, that English art is in a state of transition, and that the institution itself is being subjected to an ordeal which will tax the exertions of the council to carry it through to a successful maintenance of its prestige. The excellence of the present exhibition is mainly due to the contributions of painters who do not enjoy the privileges of membership. The new school of painters who discard the Academy traditions and teachings are making their influence felt in a most marked degree. The most remarkable collection of pictures now hung is, he says, that at the Grosvenor, where the average merit is higher than anywhere else. Mr. Whistler's arrangement of the pictures at the Society of British Artists, although very satisfactory from an artistic point of view, has caused a great falling off in the attendance of the public, and next season the society will revert to the former system of hanging. Mr. Dyball points out that the public are becoming increasingly intolerant of indifferent productions, and considers the plan of inviting specially selected works is amply justified.

AT length there is a prospect that Parliament-street, which has always inconveniently blocked the access to the Houses of Parliament from Whitehall, will be widened and rendered more worthy of its important position. By the Westminster Improvements Bill, which has passed with certain modifications unopposed through Committee of the House of Commons, four "undertakers," named in the measure, are authorised to double the present width of Parliament-street by the removal of houses for the whole length of the western or parkward side, necessitating the abolition of King-street, to construct an entirely new street from opposite the carriage entrance of the India Office to the Broad Sanctuary at Westminster, and to lay out afresh the whole area between the Government Offices and Great George-street. The weakest point in the Bill is the clause providing that the new buildings in Parliament-street, Charles-street, and facing Parliament-square-gardens, "shall be of handsome architectural design, in harmony with the Home and Foreign Offices, and approved by Her Majesty's Commissioners of Works." The recollection of the utter failure of a similar provision in the Bill for the formation of Northumberland-avenue, in which the Institute of British Architects managed to insert powers to "approve" the designs for new buildings in that thoroughfare, raises grave doubts whether the Chief Commissioners will be likely to do more than obstruct and irritate architects who prepare designs for buildings in the new streets, while the grossest offenders against good taste and architectural amenities will go unchallenged.

THE Shropshire Archæological Society has received a unique and valuable gift from the Rev. E. L. Barnwell, of Melksham House, Wiltshire, in the form of 300 camera-lucida sketches of ancient buildings, and pre-historic remains in North and South Wales and the bordering counties, made by Mr. Worthington G. Smith, F.L.S., &c., from 1875 to 1885. They are substantially bound in seven folio volumes, each sketch being mounted on thick cardboard, and arranged in counties. The views of buildings, &c., are all carefully coloured, and the prehistoric remains, comprising cromlechs, kistvaens, inscribed and sculptured stones, are all drawn to scale. These invaluable volumes will be deposited at the request of the donor in the Free Reference Library at Shrewsbury.

AT Winchester Cathedral on Friday, in preparing a place for the stone inscribed with the name of Edmund, eldest son of King Alfred, the receptacle of the heart of Bishop Nicholas of Ely, 1279, was uncovered and examined by the Dean. In a block of stone, protected by a plate of lead and an upper slab of grey marble was found the case containing the heart. The case, which was presumed to be of pewter, was sewn up in a napkin of silk or damask. The vessel was not uncovered, and was carefully reinterred after Mr. Baigent, the antiquary, had taken drawings. Bishop Nicholas, of Ely, was Lord Chancellor and Lord High Treasurer of England before he became Bishop of Winchester.

AT the sitting of the Select Committee of the House of Commons on town holdings on Tuesday, Mr. J. J. Stockall, Grand Master of the Manchester Unity of Oddfellows, and Mr. J. Holmes, a former Grand Master, testified to the prevalent desire of working men to become possessors of their own dwellings and to the objection they felt to expending money in the purchase of property which would pass away from them or their families after a certain number of years. Speaking from experience, they were able to say that the possession of their own freeholds made men better members of society and more careful of the condition of their dwellings and surroundings. The committee again adjourned.

THE twenty-fourth annual meetings in connection with the Gas Institute are being held this week under the presidency of Mr. W. Foulis, of the Glasgow Corporation Gas Works. The proceedings were begun with a business

meeting in the Corporation Galleries, Sauchiehall-street, on Tuesday, at which the annual report was adopted. The president afterwards delivered his inaugural address, in which he urged that rule of thumb should be abandoned in every detail of gas manufacture, which ought to be based on scientific analysis. In the afternoon the members visited Broxburn Oil Works. Wednesday morning was devoted to the reading and discussing of papers and communications, and the afternoon to going over the Dawsholm Station of the Glasgow Corporation Gas Works. Yesterday (Thursday) the reading of papers was continued, and the business part of the programme concluded. In the evening a reception and conversazione by the Lord Provost and Corporation was to be held in the Corporation Galleries. To-day (Friday) is set apart for an excursion to Inverary Castle, and as supplementary to the meeting, the members of the Institute are to be permitted to inspect the Forth Bridge. Papers and communications have been read by Mr. D. R. Stewart, Broxburn; Mr. R. Fish, London; Mr. C. E. Jones, Chesterfield; Mr. W. J. Warner, South Shields; Mr. G. Livesey, London; Mr. W. H. Y. Webber, London, on "Gas-holder Framing"; Dr. Stevenson Macadam, Edinburgh; Mr. F. Lux, London; Mr. G. Anderson, London; and Mr. J. Head, London.

THE Chicago Auditorium will be a vast structure, from all accounts. The building will cover the ground on the north side of Congress-street, between Michigan and Wabash avenues, and will have about the area of the Grand Pacific Hotel. It is to be ten stories in height, or 144ft., and near one corner there is to be a large square tower, 81ft. higher. The design is to be modelled after the Palazzo Vecchio at Florence. Forty feet of business rooms will adjoin the theatre on three sides; the hotel will occupy two sides. The theatre is to seat 5,000 persons; the seats will be arranged in circular rows upon the ordinary plan. There will be also a rehearsal-hall on the seventh floor to seat 480 persons. Six elevators are to be provided on all the sides, one in the tower, which will be utilised as an observatory and place of popular resort. The design shows a bold treatment in the Florentine style and a variety in the fenestration. The external dimensions are 187ft. towards Michigan-avenue, towards Congress-street, 361ft.; the height of tower is 225ft. There are to be fifty boxes open to all in the theatre, the scenery will be lifted out of a well under the stage, and there will be three galleries.

A Select Committee of the House of Commons on Tuesday passed the preamble of the London Parks Bill, which provides that Victoria Park, Battersea Park, Kennington Park, Bethnal-green Park, Westminster Bridge, and the Thames (Chelsea) Embankment, which have hitherto been maintained by the Commissioners of Works, shall now be maintained out of the local rates. In the petition of the Metropolitan Board of Works against the Bill it was mentioned that the transfer of the parks would entail a burden on the rates of £19,000 a year.

The annual *soirée* of the Royal Academy took place last (Thursday) evening.

Mr. John Cowper, for many years clerk of works to the Birmingham School Board, died last week in the general hospital in that town in consequence of injuries to his hand and hip, received on April 25th, by falling against the propeller of ventilating apparatus which had just been fixed and started in a new school.

An exhibition of needlework and embroidery is being held, by permission of Lord Amherst, at 43, Grosvenor-square, and will remain open till Monday night, under the patronage of the Princess of Leiningen and other distinguished ladies. The prizes for embroidery and designs will be adjudged by Sir Frederic Leighton, P.R.A. The proceeds of the exhibition will be devoted to the training of women as skilled needlewomen, and also to the instructing of working women in the making of their own clothes.

A new supper room has just been added to the Rougemont Hotel, Exeter. It has been erected from the designs of Mr. C. Ware, of Exeter, by Mr. J. Trevena, of Plymouth, at an outlay of several thousand pounds. Mr. Algar, of Exeter, executed the decorations.

A new school has just been completed in Wilton-road, Hackney, for the London School Board. Designed by Mr. T. J. Bailey, architect to the board, the contract has been carried out by Mr. C. Cox for £12,276.

Trade News.

WAGES MOVEMENT.

DUNDEE JOINERS' WAGES.—At a mass meeting of joiners held in Dundee last week, the wages question was discussed, and reference was made by several speakers to the want of a standard rate of pay in the town, and the necessity that existed for a uniform rate being established. It was resolved that the employers should be approached with the view of getting the wages equalised to a standard rate.

STRIKE OF DUNDEE MASONS.—On Saturday the Dundee masons came out on strike for an increase of wages. Some time ago the men made application that the standard rate of wages should be raised a halfpenny per hour—from 7d. to 7½d., but the masters refused to grant this increase, and at a meeting of builders, held on Monday, it was resolved to resist the demand. The secretary reported the receipt of a letter from one of the largest firms in Glasgow, stating that the standard rate of pay was 7d. per hour, the same as in Edinburgh and Leith.

CHIPS.

The *Standard* states that among the measures which the Government intend to bring in and press through this Session is the Bill to make permanent and extend the application of the Employers' Liability Bill.

A new church is about to be built at Walsham, near Bury, Lancashire, as a memorial to the late Jesse Haworth. Mr. Lawrence Booth, of Manchester, has been appointed the architect.

A new highway bridge at Mertoun, N.B., said to be the flattest bridge in Scotland, was opened on Monday. The arches, five in number, have each a span of 70ft. 6in., with only a rise of 6ft. 8in.

Mr. John Aird, the contractor, has accepted an invitation to contest in the Conservative interest the vacancy in the representation of North Paddington caused by the death of Mr. Lionel Cohen.

A carved oak pulpit, with freestone base, has been erected in the parish church at Burlescombe, Devon, as a Jubilee memorial. A brass plate is fixed on the pulpit bearing the following inscription:—"This pulpit is placed here to commemorate the Jubilee of Queen Victoria, D.F., 1837-1887." Two new polished brass bracket-lamps have also been fitted to the pulpit. The whole of the work has been executed by Messrs. Luscombe and Son, carvers and artworkers, of Exeter.

The Leicester School Board have accepted the tender of Messrs. T. and H. Herbert at £3,977 for the execution of additions and alterations to the school in Belgrave-road.

Messrs. W. L. Newcombe and Knowles, of Newcastle-on-Tyne, are the architects of a new Presbyterian church which is in course of erection in the suburb of Jesmond.

Mr. A. Bruce Joy has just completed a small sketch model for the full-sized statue of the late Alexander Balfour which Mr. Joy has been commissioned to execute for erection in Liverpool.

Major Tulloch, R.E., held inquiries at the Guildhall, Walsall, on Tuesday, with reference to two applications on the part of the corporation. The first was for permission to utilise an unexpended balance of certain loans, amounting altogether to £64,510, which they have been authorised to borrow for the purposes of sewerage and sewage disposal, in the execution of other works of the same character. The second was for permission to borrow a further sum of £15,000 for the purposes of the gas undertaking. The town clerk (Mr. Cooper), the borough surveyor (Mr. Hardwicke), and the gasworks manager (Mr. Tindall) explained the proposals.

The memorial-stone of a Primitive Methodist Chapel, Belle Vue, near Wakefield, was laid on Saturday week. The new building is entirely of stone, 47ft. 6in. by 34ft., and will seat 300, including the Sunday-scholars. The roof is open timbers, wrought inside, and ceiling divided into panels; the fittings are entirely of pitch-pine. The cost is £860 6s. 9d., exclusive of some of the stone, which is given to the committee. The architect is Mr. William Watson, of Wakefield.

Sir Frederic Leighton and some other artists support an appeal in the daily papers for funds for the extension of the Free Art Gallery and Library movement in Battersea. The purpose is to "remove the intellectual poverty of South London." The President of the Royal Academy states that working men themselves give their time and money to it, and he wants a similar gallery in the south-eastern district. He is supported by Sir James D. Linton, P.R.I., Mr. Burne-Jones, A.R.A., the Hon. John Collier, Mr. Walter Crane, and Mr. G. F. Watts, R.A.

The memorial stone of the principal office of the London and South-Western Bank was laid on Thursday last by Sir George Prescott, Bart. The new buildings will have a frontage in Fenchurch-street and also in Gracechurch-street. The architect is Mr. J. S. Edmeston, of 47, Old Broad-street; the builder, Mr. W. Shepherd, Bermondsey; the clerk of works, Mr. Tookey; and the foreman, Mr. Walden. The contract is £32,700. The men on the works enjoyed a supper in the evening at The Bell, in Bell-yard.

We are pleased to hear that all opposition to the Bill for securing to the inhabitants of Stoke Newington Clissold Park as an open space, by purchase from the Ecclesiastical Commissioners, has been withdrawn, and that the Bill will proceed as an unopposed measure.

Holloway's Ointment and Pills are infallible for curing bad legs, varicose veins, swelled ankles, erysipelas, scaly skin, and every variety of skin disease. Over all disorders Holloway's remedies exert a quick and favourable action, and where cure is possible gradually but certainly arrive at that consummation. They are invaluable in the cure of scrofula and scurvy.

RIVAL FEATURES OF ARCHITECTURE.

AN analysis of the architecture of the day reveals three or four distinct features which are just now struggling for supremacy. Viewed quite apart from the question of style, for they have really outlived it, and they are common to all phases, it may be interesting to inquire into their claims to be regarded as distinctive elements of architecture. The first two, the entablature and the arch, are as old as the art itself; ever since men practised an art of building, one or the other of these systems has prevailed, and a perpetual change of one for the other has taken place. The succession of styles has been, in fact, chiefly the mutation from one of these methods of structure to the other. We now use the concrete terms of entablature and arch to express the systems known under the wider denominations of trabeation and arcuation.

We consider the two together because they are opposite systems of accomplishing the same purpose—that of covering or spanning spaces. Every student and architect is acquainted with the origin and development of these two systems from the earliest Egyptian and Greek to the latest style, and therefore it will be superfluous to say anything on the historical evolution of the entablature and the arch. Our purpose is to point out that the two systems are practically still struggling, although our requirements have multiplied a hundredfold, and our new methods of construction and materials have been increasing in the same ratio. At one time, not long ago, we all thought the entablature had taken its departure as an effete element of archaic building—that it was passing into oblivion with the remnants of Greek temples. The arch was everywhere triumphant, not only in churches, but in houses and factories, and the reign of arcuation seemed to be a lasting one, and the system to have taken a firmer hold than ever; but it was not for long. Even church architects, the most wedded to the system, began to tire of pointed windows of equilateral proportions in aisle and clerestory; the proportion of the arch underwent a change of form, it was no longer acutely pointed as it had been; the 12th-century French influence made our architects adopt a form in which the centres for striking the arcs were drawn nearer and nearer together in the centre, till we had almost the Early Transitional and Norman form, known as the "drop" arch; the lancet and equilateral had entirely disappeared. The segment-pointed offered advantages in some positions; but latterly the arch has become still more depressed, and church architects are using, in pursuance of an "irony of fate," the not long ago contemned, flat, semi-elliptical arch of the Debased-Gothic or Jacobean period, in which the point is lost altogether. Change of style from Early to Late Gothic was no doubt the apparent influence in this substitution of the flat for the acute form of arch; but behind it there was the general preference for flat-headed openings. Architectural taste was reverting again to square forms and horizontal lines. The entablature was beginning to reassert itself. The Free Classic, delighting in the forms of High Dutch and Late Georgian, re-established the square-shaped opening and flat arch, though there was more than mere style at work. Practical common-sense and social habits had something to do with the change. The pointed arch could never fit comfortably under flat ceilings, or adapt itself to convenient sashes and internal hangings; moreover, the girder and the trussed beam had been invented, and could not be turned to account. A hundred other practical necessities favoured the introduction of the entablature. A square window was cheaper than the arched; the glass could be cut easier, sashes could be fitted to open by degrees, unlike casements, which could not be partially opened for ventilating purposes. Materfamilias was not compelled to hide the pointed arch by drapery, or to invent some hanging in lieu of her favourite valance and fringe; mullions and painted glass she voted tiresome when there were sights to be seen. All these and more were instrumental in changing the style. Stronger reasons prevailed; floors had to be marked so as to indicate the division into stories, and thus we have repeated what was done in many European countries during the Renaissance in the 15th century, the substitution of horizontal Classical cornices and pillars to mark the stories. And so long as architecture lasts we shall have the columnar ordinance—sham it may be called by some who look upon it as a mere mask, but just as much the expression of the story as the buttress was of the vaulted bay of the cathedral.

Next we have as a rival to the entablature the round arch. No feature has gone through more changes to meet building necessities, notwithstanding that it still maintains its popularity amongst architects. Some years ago the arcuated style was all the rage. The palaces of Florence and Venice were placed under contribution, and several important buildings were designed in which the windows were all semi-circular, architraved, or moulded. The arched opening proved troublesome and expensive in commercial buildings: the semi-circular apertures had to be sub-divided by shafts and minor arches; carving was necessary in the heads, and massive piers were needed at the angles to give apparent stability. On the contrary, the round arched Italian possessed a degree of lightness and vivacity, and lent itself readily to sculptural decoration. It was capable of florid effects. We have examples in the Carlton Club-house, from Sansovino's Library of St. Mark, in the fronts of the Home and Colonial Offices. Very often the "orders" were combined, as in the Venetian and Roman examples: the horizontal lines of entablature are very dominant, though the meaning and expression of the arch lose something by the association. One of the most elegant adaptations of this treatment is Palladio's arcades round the Basilica of Vicenza, which has been largely imitated and varied. The arcade is open, and the intercolumniations wide; the principal order is happily employed in accentuating the piers and floors, and the subordinate order under the arched openings enables the whole space to be given to the windows. Another variety is noticed in which the arched windows are grouped together in twos and threes, or more. When the side windows are smaller and lower than the centre one, the effect has an awkwardness about it, and the internal finishings of the heads become as troublesome as they do externally, where perhaps each arch has an architrave member round it, and each arch a keystone, which in some cases is made to reach to the horizontal member or cornice above as if it was necessary to give every arch a deep wedge, and to load it heavily—an unmeaning kind of architecture which is affected because it looks a little fussy and pretty. There are other ways of employing the arch effectively. Mr. Waterhouse has done so at the Natural History Museum, where he has given us a modernised Romanesque. Where light is important a series of arched openings, moulded or with double reveals, may be employed. Near Chancery-lane is an example of a front with arched apertures of this kind, a sort of half-Gothic treatment being given to one of the tiers by tympana of pointed form over the arches carved in relief; the piers between the arches have a horizontal springing course carved with foliage representing capitals, so that the horizontal lines are strongly marked. The carved capital course is a feature that has been very often effectively combined, especially in rows or series of arched windows where the intervening piers are narrow; but it is rather meaningless when used on wide solid piers to connect the arches, as it does not accentuate any constructive feature. The value of the arched aperture is mainly in giving variety to a façade; one entirely made up with round-headed windows looks more monotonous than the trabeate treatment.

The "pier" or "vertical strip" is another predominating feature in modern buildings. Perhaps it was as a protest to the horizontal entablature and order that architects took to it. It was a contrast at first, and it has grown immensely. Whatever motive first prompted the use of the pilaster-strip, it is obvious that the Gothic architects took to it as a kind of compromise when called upon to surrender the pronounced verticality of Gothic. It is a strong Renaissance feature, as we see in the buildings of the François Premier period in the châteaux like those of Chambord, Berri, and other domestic works. Architects of this school delight to cut up their wall surfaces with pilasters and horizontal stringcourses, producing a series of blank rectangles; but it can be carried to excess. The design suffers from want of breadth and dignity, and the repetition of vertical features and bays divides the façade into narrow vertical slices. In a long front the effect is that of a row of houses. The vertical is as much emphasised as the horizontal members, creating distraction and want of unity. The architect may pander to this caprice till he finds he has no architecture worthy of the name left. Then the multiplication of stringcourses, one level with the heads and another with the sills of the windows, and perhaps two or three lines of entablatures or cornices one over the other, or in the course of the height of a window, is a sort of redundancy that can only be compared to similar repetitions of words conveying the same meaning, or pleonasms—a sort of tautology quite as mischievous to good architecture as it is to written language. The pilaster strip or panelled stile has its value in accentuating piers, and in red brickwork and terracotta it has been employed with effect. The rule seems to be to use it for accentuating the piers or jamb lines of superposed windows as pilasters to a wall. So the horizontal stringcourse should be employed to give breadth, or as framings for sculptural relief; whenever it is used without reference to these objects, it is wrongly employed and mischievous.

There is also the gable. This is certainly another Gothic feature of value in domestic architecture, but very often misemployed in large public buildings—we mean in the way of repetition. It is now common to break up a long roof by a succession of gables of precisely similar pattern, dividing the length of the façade in an objectionable manner, and making it appear that the façade is composed of a number of separate parts or houses. We can hardly conceive anything so inimical to breadth and dignity; but it has become fashionable, and so it is done. We can admire the picturesque treatment of the gables in Mr. T. G. Jackson's new quadrangle of Trinity College, Oxford, which we illustrated last week, though not the repetition of them in his otherwise clever design for the Imperial Institute. A series of gables, with the means provided for the discharge of rainwater between them, if other objectionable vertical features are not

introduced, cut up the façade into a number of vertical parts. Continuity of line is maintained by the employment of the cornice, and it must be remembered that the cornice and gable are irreconcilable features, and the one has developed at the expense of the other. The architects of the great Hôtels de Ville of North Germany perceived the value of the uninterrupted horizontal lines, the dormer being reduced to tiers of small gabled openings in the high roofs ; but it has been left for English modern architects to break this rule by omitting the cornice, and thickly studding their roofs with gables. The cornice and the gable are just now opposing elements of architecture, though the principle ought not to be lost sight of that each has its value in certain situations, and an ascendency of one can only lead to a very short-lived supremacy.

BUILDING CASUALTIES AND CONVERSION.

THE sudden overturning of a wall in York-street, Walworth, attended by the death of two persons, through the piling of a quantity of manufactured iron against it, adds another to the list of catastrophes of this nature. We lately referred to the fall of a wall at Sheffield from the same cause, and we may yet have others to record before legislative action is taken to make it impossible that accidents of this sort should occur. It has only been after repeated failures attended by fatal consequences that the law has interfered in these matters, and now we have had so many recent cases of collapsing walls through carelessness on the part of those who store iron and other weighty materials against them, it seems time that the local authorities should inspect storage of material in warehouses, no less than see that the building is substantial. Without supervision of some kind the warehouses and stores in thickly-populated parts become a source of positive danger in our midst. With the increased value of storage room there is always the danger of our warehouses becoming overtaxed, to which cause must be assigned these frequent accidents. The Western Association of Architects in America some time ago agreed to a very desirable step being taken in their own and the public interest. They drew up a form which every architect was to hand to his employer, in which the purpose and destination of the building is clearly stated, the load to be placed on each floor of the building, and the strength of each beam. The employer was to sign the statement of particulars, and a copy was retained by the architect for his own protection in case of any failure or change of purpose of the building. The specified particulars would show distinctly the object of the structure, and for what use it was designed, so that if the employer turned a house, after it was built, into a warehouse, and overburdened the floors with a greater weight than was intended should be placed on them, and an accident occurred, he could not hold the architect responsible for the failure. Why may not a statement of the intention of every builder or occupier of buildings be required by the local authority, and an agreement binding upon all who built or occupied warehouses be drawn up requiring that no loads should exceed a safe weight, and that walls should not be subjected to lateral pressure by storage of heavy and unsuitable masses of material against them. When once the rule was initiated, there would be no difficulty in carrying out the arrangement. In the case of every building used as a warehouse or store, there might be a written undertaking given by the owner that the building was capable of carrying a certain maximum load on each floor, and a similar undertaking by the occupier not to exceed the weight. This statement ought to be certified by a local authority at stated intervals, and such a certificate of strength would be a guarantee to the tenant and to the public. Of course, an inspection would be required to see that the certified strength was not exceeded, and a penalty enforced for non-compliance therewith. If legislation made it compulsory to require a certificate of structural qualifications for every building of this kind, we should hear of fewer of these sudden and fatal accidents. How many hundreds of warehouses are at this moment overburdened by loads far in excess of anything they were designed to carry? We should be astonished, probably—if we only knew it—at the number of thin and tottering walls which are in the same condition as that which fell at Walworth, loaded by piles of iron or scaffold poles and other materials. Few but those employed in warehouses or stores know anything about the great risk to which the walls are hourly exposed by being made retaining walls. An accident happens, and a person is buried in the *débris*, and then the error is found out. There is little evidence published about the Walworth warehouse ; it was used for iron, and was situated at the back of what had been a parish school which is being altered into a hospital. The place was being partly pulled down, when the wall of warehouse collapsed. Long bundles of tire iron were stacked against the wall of a shed adjoining the late school-house, when suddenly it fell, burying two persons, whose bodies have been extricated. Possibly the disturbance caused by pulling down the adjoining building and taking away some support was the immediate cause of the accident, but whatever can be assigned, there appears little doubt that the stack of iron had exceeded the conditions of safety. As we have pointed out, a quantity of scaffold-poles or iron bars laid against a wall in a direction parallel to it, is very unstable ; the stack is piled up high, the heap acting like a wedge or prism of wet earth against a wall, and the slightest disturbance or vibration is apt to cause a motion of the mass on its natural bed.

We may also draw attention to another origin of serious danger in building operations which does not receive the attention it merits. The conversion of a building intended for one object to quite another purpose is attended with consequences often of a dangerous character. We drew attention to the collapse of a shoe warehouse at Manchester the other day. It appears the proprietor of a shoe warehouse had added together for the purpose of his trade a few small shops, and had for this purpose removed some of the division walls. The original state of the shops appears to have been of a flimsy kind, the division walls were only a half-brick thick, and the timber of the floors was inadequate. A telegraph-pole on the roof had been lately added to the weight which the walls had to carry, and sundry alterations were going on in the lower part of the premises, the upper part being temporarily supported. On a sudden the building collapsed burying two or three, killing two women, and injuring several others. The throwing together of a number of shops or houses is an operation that goes on every day in every large down. London establishments are often a collection of separate houses—an absorption of shops—and we can name several establishments used for furniture and drapery where a dozen or twenty adjoining houses have been joined together by the partial removal of the party walls of the lower stories. Such operations are safe enough when the adjoining houses are soundly built and due care is taken to shore up the floors and to support the upper portion of the divisional walls ; but they become dangerous whenever these conditions are wanting, and the risk increases with the number of houses that are connected. Building acts and by-laws are rather weakly framed to meet this kind of internal conversion ; the operations are left to the builder, who receives little attention from the surveyor. When we consider the effect of removing or pulling down party walls to make a continuous shop, the weakening of the external walls which results from the removal of supports to the floors and roof, it is not to be wondered at that accidents happen. When the upper portions of the division walls are left and carried on girders, a stress is laid on walls which are incapable of carrying an addition to their own weight ; even if columns are introduced they are sparingly inserted, and their load is concentrated on a much smaller area of footing than is often safe. Then it must be remembered the upper stories are often used for storage of goods, thereby increasing the load coming on the floors that were only designed to carry ordinary bedroom furniture. The loads and stresses are reversed, they are carried on fewer walls or columns chiefly on the outer walls, and the structure and its contents make a top-heavy arrangement very different to that first intended. The sections of the Public Health Act dealing with the structure of walls, foundations, roofs, and chimneys refer to new buildings ; the schedule of wall thicknesses applies to new buildings of the domestic or warehouse class, and, what is more remarkable, the only section referring to conversion (Sec. 159) deals simply with conversions of any building into a dwellinghouse. Nothing is defined with regard to the structural conversion of a number of houses into one large trade establishment.

MARBLE AND MARBLE WORKERS.—XI.

By ARTHUR LEE.

PRACTICAL.

THE information contained in the preceding chapters would be incomplete without some consideration of the manner in which it may be best turned to practical account. Improved modes of transit by land and by sea have given to architect and to marble worker a selection of material which a generation ago it would have seemed impossible to obtain. At the same time, and partly for the same reason, the item of cost has been vastly reduced, and as a consequence a most serious obstacle to the use of marble as a decorative material has been removed. The marbles of the whole world are to-day at the disposal of the architect. The practical question for his consideration is where and how to use them.

In northern climates the use of marble is almost entirely confined to indoor purposes. The beauty of the coloured marbles does not appear until they are polished, and no marble will retain a polished surface for long under exposure to the weather. As a general rule, therefore, marble is unfit for outside work. The principal exception is that of the hardest Sicilian marble. The beauty of this stone is not dependent upon its retention of a polished surface, and if due care is exercised upon its selection it will bear exposure very well. The best Sicilian for outdoor purposes is of a perfectly even texture and colour—so hard as to emit a clear ringing sound when struck and of highly crystalline formation. Veined Sicilian should never be used in situations in which it will be exposed to the weather. A decided vein marks the line where disintegration will commence.

To make the most and the best of veined and coloured marble, a great deal depends upon the way in which a block is cut. It should be so sawn that the figure is displayed to advantage. These marbles are, however, usually employed in thin sawn slabs, and a buyer has little difficulty in finding that which best pleases his taste. With Sicilian and statuary,

which are frequently required in masses and in block, the selection becomes more difficult. Never select blocks in bright sunshine. The best time is on a cloudy day after a shower of rain, and early in the morning. If a block can be "looked into" at all, it will be then. In selecting blocks of statuary, a sharp look-out should be kept for yellow spots or veins; they are less likely to be noticed than black ones, which are more easily discovered. Much of the statuary imported from Italy is unfit for sculpture at all. It is very white, with a bright sparkling crystal and a taking appearance; but it crumbles under the chisel, is of a soft sugary substance, and very quickly decays. The best blocks are hard and close-grained, and if of uniform tint are none the worse for a slightly yellowish cast; they work evenly under the chisel, and are not too transparent.

The best white marbles of Italy are eminently suited for sculpture. In no other material is it possible for the conception of the artist to be reproduced in permanent form with such satisfactory result. The hardness of these marbles, and the fineness of their grain give effect to the most delicate touches of the chisel. The purity of white marble is in itself an aid to the grace and beauty of the composition. It has one distinct advantage over bronze or any material which requires to be cast. The last touches in marble are those of the artist himself; in all cast work they are perforce those of the founder and his men. Polished marble will not harmonise with a material which presents a rough surface. It does well with glazed tiles, burnished metal, and polished woodwork. It is very suitable for the ornamentation of fireplaces. For this purpose an unpolished stone is apt to become dirty, and the employment of wood is attended with danger. In all situations in which bare stone is left to be touched or brushed against, marble is the only material to be tolerated. It is not enough for the architect to see samples of the marbles which he means to employ. He should be careful to inquire into the soundness of the material, and of the size of the blocks which can be procured. He should also see samples which are of sufficient size to give a good idea of colour and effect. Some marbles may be obtained in which colour and texture are fairly average throughout large slabs or blocks. In others there is an entire difference in the space of a few inches. Some marbles are only to be obtained in small blocks, and it is useless to specify them for situations in which single pieces of large size are required. Some marbles are so full of earth cracks and vents that they are quite unsuitable for any work in which they are required to give support, as, for instance, in the matter of columns. It is not long since that the columns of a new church built in Paris were constructed of a marble which was unfit for this particular purpose. The result was that even before the building was completed weakness was exhibited in the shape of several formidable cracks in the columns, and in the end the whole of the work was taken down and rebuilt. A vast amount of trouble and disappointment may be saved by a little inquiry before a specification is decided upon.

It will be found that the adoption of this step will almost always result in a very considerable saving of cost. Of two marbles which produce a similar effect, the one may cost in working three times as much as the other. In some situations it may be an advantage to build up intricate mouldings out of thin slabs. Working out of the solid may mean the spoiling of a design or a cost which becomes prohibitive. The selection of the marbles with which different parts of a design are to be carried out is of more consequence in the matter of cost than appears at first sight. Other factors being equal, it is well for the stone which is most easily manipulated to be employed in those portions of a design in which there is most work. Too frequently the consideration of these matters is left until after a plan is made and a specification prepared. In such cases money is thrown away which might have been usefully employed in another direction, the work is altogether abandoned, or the inquiries which should have been made first are made last, at an expense of time and trouble which might have been easily saved.

The harder marbles afford excellent material for the construction of steps and staircases. A flight of marble steps is not only beautiful in appearance, but it is calculated to withstand an enormous amount of wear and tear. In selecting marble for this purpose, it should be remembered that the effect of a flight of steps depends upon the regularity and evenness of the lines, and the simple alternation of light and shade in the tread and riser. Coloured marbles with strong markings or veins are not suitable. The self-coloured marbles or one of the dull grey varieties should be employed. The even colour of Sicilian, Correblanchien, and of Istrian marbles makes them especially useful for this purpose. The effect which should be produced by a fine flight of steps is ruined by the employment of a marble in which the veins run obliquely and distort the horizontal lines, or in which waves of colour disturb the effect of simple breadth of light and shade. These remarks apply equally to moulded work. Heavily-veined marble destroys all the beauty of the lines of mouldings. As far as possible, work of this description should be carried out in plain black, white, or grey. Generally, finished work in marble is polished. The effect of reflection from a highly-polished surface should be carefully borne in mind, otherwise it will be found that some members of a moulding will be completely obliterated in certain lights.

The variegated marbles should be reserved for flat surface decoration. Due care should be taken that the size of the panel or slab is sufficient to display the variety of the markings. If this is not done, half the beauty of the marble will be lost. In small panels, a marble which has close, fine markings should alone be used. The only exception to the general rule as to the employment of veined or variegated marbles is in the case of columns. The smooth cylindrical face of a column shows off the beauty of the markings as well as, or better than, a flat surface. If the column is fluted, the objection to these marbles again returns in full force.

Marble may be most usefully employed for the paving of halls and passages and of rooms in which much traffic is expected. A floor of marble mosaic is one of the most beautiful and at the same time one of the most durable which it is possible to construct. Marble tile floors are very common in churches and public buildings in Continental Europe. Their cost as compared with tiles made of clay has operated against their employment in England. Modern machinery and competition have now removed this obstacle, and marble tiles can be obtained which very little, if at all, exceed the cost of the ordinary encaustic tiles. If a clay tile pavement which has been much used is examined, it will be found that each tile is worn more or less hollow in the centre. A similar traffic over marble tiles produces scarcely perceptible results.

Some most useful rules with respect to the employment of marble have been laid down by Mr. T. Graham Jackson. They are as follows:—

"1. Decorative carving in marble—as, for instance, in cornices, capitals, and friezes, where high relief and bold design are required—should be severe and conventional. Naturalism is forbidden by the stubbornness of the material except in the highest subjects, such as the human figure, which repays the expense of labour, or else in very low reliefs, where the labour of execution is reduced within moderate limits.

"2. Sculpture should be in white marble, or if in alabaster, only in such as is free from veins or stains of colour.

"3. Moulded architectural features, such as vases, bands, strings, cornices, architraves, and abaci, should be either in white or some uniform colour, without markings or veins.

"4. Variegated marbles should be used only for panels or columns, or, in other words, on plain smooth surfaces, either flat or curved, so as to display the beauty of their markings to the utmost, without interfering with any of the structural lines of the architecture.

"5. Coloured marbles should be used with moderation, too great a variety being avoided, and those of the quieter and more harmonious tones preferred for general use.

"6. Strong contrasts of colour on a large scale are dangerous, and generally incline to vulgarity.

"7. Strong contrasts on a small scale, as in mosaics and inlaid work, are necessary.

"8. Stone and marble should be kept apart as much as possible."

ADDITION TO THE NATIONAL GALLERY.

WE were invited last Saturday to inspect the new rooms that have been added to this institution, which were opened to the public last Monday. Last week we referred briefly to the additions that have been made to the gallery, and have published illustrations of the grand entrance and staircase (April 29th last). We may now speak of the design as a whole, and of the rearrangement of the pictures that has been made under the able directions of Mr. Charles L. Eastlake, the keeper and secretary. To Mr. Shaw-Lefevre is due much of the successful accomplishment of this important work, and in the arrangement of the preliminary negotiations as to the site and plan he displayed untiring zeal. As we stated last week, the plans and design were prepared by Mr. John Taylor, of H.M. Office of works, and they have been carried out under his superintendence by Messrs. Mowlem and Co. and Messrs. Stephens and Bastow, of Bristol, the latter firm having contracted for the second part of the undertaking. The marble work, which is a handsome feature of the design, has been intrusted to Messrs. Farmer and Brindley, and the mosaic floors to Messrs. Burke and Co., of Newman-street, Oxford-street. The additional galleries number five in all, and have been arranged on the axis of the principal entrance; they include a large gallery in a line with the main stairs and vestibule running north and south, two small lateral rooms forming with it a cross in plan, and opening from it by doorways, a small end room of similar size, and in the rear a large gallery running transversely, and forming, with the old gallery No. VII., the northern block of the building. The new north vestibule at the top of grand stairs opens by a triple archway of three doorways. The shafts of columns dividing them are of Rouge Etrusque Numidian marble — a deep, rich, reddish-veined material quarried near the coast of Algiers. These stand on bases of Pavonazetta marble, which same transparent and handsomely-veined marble is employed in the engaged pilasters to the triple archway. The capitals of the columns are Corinthian, and are carved in alabaster. The tympana of the arched heads of the three doorways are treated as bronze, with heads in relief of celebrated painters, the three inside the gallery representing Rubens, Titian, and Rembrandt, those facing the vestibule including Raphael and Da Vinci. Entering the Gallery No. 1 we find a spacious, well-proportioned room with raised skylight in the centre, coved ceiling divided into ribs, a cornice and frieze, the decoration of which is subdued in colour, and in keeping with the style. A Greek fret runs round the frieze, and gilding is discriminatingly introduced. The walls are hung with a deep, rich, red-toned flock paper. In this room and in the lateral room III., Mr. Eastlake has very successfully arranged the pictures of the Tuscan schools. A fine altar-piece,

with predella, by Filippino, occupies a good place, representing Virgin and Child, St. Jerome, and St. Dominick; a Sarto, and a Da Vinci of the same subject, the Virgin kneeling, painted on panel on one side. We next come to a work by Michael Angelo, a Madonna and Infant Christ, St. John the Baptist, and angels; other works are by Bronzino, an allegorical composition, and Botticelli; on the other side of vestibule doors is a large painting by Michel Angelo; an unfinished picture, representing the Entombment; one by Pallaiuolo, showing the Martyrdom of St. Sebastian. A fine "Assumption of the Virgin," by Botticelli, and a picture of Uccello, a battle piece, are hung in the small side gallery, No. III. In the large gallery, VI., which is similarly treated to the first, the masters of the Umbrian school are represented. Pictures by Forlí, representing Rhetoric and Music; two fine pictures by Pinturicchio, illustrating "The Story of Griselda," the Separation and the Restoration, are noticeable. We also find a triptych by Lorenzo, representing Virgin and Child, with Saints, of very great interest and merit. On the long wall are pictures by Perugino—one, the Virgin adoring the Infant Christ, and the Archangel Raphael, and Tobias, in three compartments. In the centre is placed the celebrated recently acquired picture by Raphael in a massive gilt frame, with side pilasters and cornice, the subject of which is the Virgin and Child, attended by St. John the Baptist and St. Nicholas, known as the "Madonna degli Ansidei." This picture was purchased from the collection of the Duke of Marlborough. The architectural background and throne and canopy on which the Virgin sits, has appropriately suggested a centre position for this fine picture in the centre axis of the new galleries; it is therefore visible from the north vestibule through the doorways. Other pictures by Perugino and Raphael are hung on this wall. At the east end of the room is a work by Signorelli, one of the Circumcision. In Gallery V. is a fine Pieta by Francia, the Dead Christ, with Virgin and angels weeping. Other works are by Benvenuti, Tura, Grandi, and Tisio. Gallery II. contains works of the Siennese school, &c., Gozzoli, Rosselli, a fragment, heads of nuns, by Lorenzotto, Lippi, Giovanni, &c.

Mr. Eastlake has shown considerable skill and discrimination in the arrangement of these grand pictures, many of which were originally hung in the other old gallery VII. They are placed in a single row round the walls, and, as far as possible, have been arranged with an eye to symmetry. Many nice points as to style, chronological order, and balanced distribution had to be considered. In the old rooms the pictures have been rearranged with much care, and the result will be a gain to all students of the great masters, and must be appreciated by the public. The overcrowded state of the walls now no longer exists. The rooms are connected by doorways, with moulded architraves of the Rouge Etrusque Numidian marble, and wrought-iron doors, hung to rails above, slide into spaces in the thickness of the walls. The new vestibules on each side of the stairs, screened by columns of the Numidian marble, with bases of New Zealand marble, are effective, and from them spring the coves, surmounted by a domical lantern. We notice the very handsome square pilasters of Cippelino, from the Simplon Pass, a beautiful variety of veined marble in single blocks, with capitals of Carrara statuary marble. The decorations have been carried out by Messrs. Crace. Mr. Dyer has acted as clerk of works.

THE LARGEST PAINTING BRUSH FACTORY IN THE KINGDOM.

THE well-known firm of Hamilton and Co., which has been established in Greek-street, Soho, for sixty years, has just removed into new and commodious premises at No. 96, Clerkenwell-road, E.C. The new building is more central and convenient, being within a few minutes' walk from Farringdon-street Station of the Metropolitan Railway, and directly in communication with the Midland, Great Northern, Great Western, and Chatham and Dover railways. Externally the building is of deep red brickwork, with Portland stone entablature and dressings, and has a frontage of 65ft. in the new thoroughfare, and a side front towards St. John's-square. The internal arrangements are of a very complete character, and the aim of the proprietors has been to economise the time and labour of those engaged in the manufacture. With this view every new appliance has been called into requisition, and the introduction of the electric light, a hydraulic lift, and heating arrangements have added much to the comfort and convenience of the employés. On the ground floor are situated the offices, showroom, and stock-room. The centre entrance is wide, and a narrow-gauge tramway is laid down for the conveyance of goods and materials into a yard at the back, where the engine-house and stores are situated. In connection with the tramway at the side of entrance is a commodious hydraulic lift. Besides the steam-boiler and an engine for driving a dynamo, we noticed a circulating boiler for the supply of hot water to the several floors, and for heating purposes. It would be impossible within the space at our command to convey any adequate notion of the details of the manufacture and the number of operations required in the production of the numerous kinds of brushes and tools for painters, grainers, and decorators turned out by Messrs. Hamilton and Co., who have achieved a high reputation for the quality and character of their goods. On the ground floor is the shaping-machine room, in which the new patent ferrule of the firm is partly carried out. In the basement we noticed the bristle store, a large well-lighted room, with lavatories and closets fitted with Bostel's apparatus; and box room. The ground floor is laid with Duffy and Son's "Acmé" solid block flooring on concrete and pitch tar; there is a tinman's shop for making the tins for graining tools. The suite of offices are fitted with dadoes of polished teak and oak floors; a Shannon filing cabinet and copying machine, with electric lights, and a self-winding clock by which the movement is wound every hour by means of a small battery. On the other side of entrance are show-rooms, a stock room for finished goods fitted with racks for the boxes, and a packing room for delivering goods. Ascending the stairs is a foreman's room, a graining-tool room, with small washing room on the half landing level. The first floor is devoted to the domestic offices and rooms, a patent varnish brush room fitted with winding machines for winding the wire bindings, and a "grinding" room with lead safe floor. On the second floor the operation of dressing the bristles is carried on, in connection with which is a receiving room where the materials are weighed and delivered; also a handle store-room, where every variety of painting-brush and graining-tool handles may be seen. Some idea of the extent of the manufacture of brushes may be gained when it is learned that no fewer than 70 different kinds of handles have to be made, chiefly of beech wood. The third floor is devoted to the manufacture of painting brushes, where several varieties of brushes may be seen in a finished state. In connection with these shops are a bleaching room and a well-ventilated drying room arranged in racks, with coils of hot-water pipes under open gratings in the floor, and air inlets, by which currents of warmed air can be made to pass through the racks of brushes. The floor is admirably lighted, and ventilated at the top and sides.

Messrs. Hamilton and Co. have perfected the manufacture of painting brushes and graining tools. Their patents are now fully appreciated. C. A. Watkins' (1879), oval bevelled varnish brushes surpass any other in the market for wear. The improvement consists of tying the bristles to the handles with wire by a patent machine, and afterwards forcing them by compression into ferrules. These are distinguished from the other wire-bound brushes by a trade mark of a screw machine with the word "Compression" across it. Another valuable improvement is a copper-wire binding round distemper brushes; the copper wire is secured with a pair of Watkins' patent copper fastenings. Each is a solid piece of copper with a shoulder at one end, and nailed on each edge of the flat handle; the wire is wound over them and the whole soldered, forming a solid mass of metal instead of the notches cut in ordinary brush handles. Various other improvements in brush-making have been patented by Messrs. Hamilton and Co., including a patent copper-band distemper brush, which is a considerable advance on the wire-tied brush; a stippling brush, hog-hair over-grainers, and other specialities in varnish brushes and oak grain-finishers.

The construction of the new building is substantial, the floors are of solid timber beams and joists; iron columns are introduced, and the structure is the largest and most complete in the kingdom erected for the manufacture of painting brushes. The building has been carried out by Messrs. E. Laurence and Son, of the City-road. Messrs. R. Waygood and Co. supplied the hydraulic lift, which is worked from the mains of the Hydraulic Power Company.

APPLIED ART.

I BELIEVE that I am responsible for first making use of the term "applied art" to art in connection with the manufacturers, and in the same sense as we speak of the "applied" in relation to the "pure" mathematics; but I soon perceived that the term "applied" could not be consistently used in this special sense, because "pure art" in an analogous sense to "pure mathematics" is not painting and sculpture, but the theory of art existing in the mind. Now, this pure theory is as applicable to painting and sculpture as it is to the art manufactures, so that all works of fine art are examples of applied art. It would be more correct, therefore, in the special sense referred to, to speak of "applied painting," and of "applied sculpture," or of the "applied arts," than of "applied art." Having determined that whatever is perfectly adapted to its purpose, either possesses no beauty at all, or as much as in the nature of things is coincident with that fitness, a clear course is left open for the determination of the extent to which "applied art," in the sense of "art appliqué," is permissible; for it must be quite clear that whatever embellishments we may please to confer on the fitness which possesses none, or on that which possesses some, these must to all intents and purposes be merely appliqué. It may be asked, "If it be admitted that the gratification of the sense of sight is a purpose in itself, may we not embellish, overlay, with fine art to any extent we please?" The answer is, "No!" for the cultivated taste, good taste, is a judicial faculty that recognises a right and a wrong—a moral limitation in these matters, beyond which lies ornateness, excess. Dufresnay very aptly says:

> "Right reigns its stated bounds between,
> And taste, like morals, loves the golden mean."

We may, then, be met with another question, "Well, but the French do not recognise the hard and fast line you would have us observe in the application of art to the manufactures. Should we not, therefore, as their competitors, commercially, do likewise?" All that I can say is that, if this be necessary, take care that you let the English artisan know that there is a better way, a way to lead the world, a way to true national greatness, even in the art-manufactures.

Cannon, rifles, pistols, swords, bayonets, &c., have been bedizened with art "appliqué," merely to gratify the eye, and without contributing one iota to the "fitness" of these weapons. Indeed, they may be made very pretty in this way, and be totally unfit for their several purposes. What would become of the War Minister who should propose that the guns, rifles, and swords of the army should be ornamented for the encouragement of "art appliqué?" The promoters of "art appliqué" may probably look forward to the ornamentation of the cylinders, beams, cranks, and connecting-rods of steam-engines. In opposition to the argument of adaptation of purpose conferring on all creations either of nature or art so much beauty as is consistent, it may be urged that an ecclesiastical edifice could be perfectly adapted to its purpose without the assistance of painting and sculpture; this was not the opinion of the great thinkers of the great art epochs, when architecture was regarded as the "setting" of the more illustrative arts of painting and sculpture. An architect of those times would not have deemed his monumental edifice perfectly adapted to its purpose, in every respect fit, without the sculpture and the painting.

We may safely conclude, therefore, that "art appliqué" can only be in any measure satis-

factorily indulged in but within very moderate limits, and in such wise as neither to impair the fitness of the utilities to which it is appliqué, nor to offend good taste. What shall we say, then, to art appliqué in the form of life-sized portraits on plates and dishes, and of a certain ware of Italian sanction housed in our museums? We know not whether it be for imitation or for warning; its design and elaboration being, as it is, an insult to common sense. W. CAVE THOMAS.

UNIVERSITY COLLEGE PRIZES.

ARCHITECTURE, Prof. T. Roger Smith, F.R.I.B.A.—Fine Art. Donaldson Silver Medals, equal. E. Hellicar of Bromley, H. S. Wood of Hereford. Third Prize. H. R. Appelbee of London. Certificates, 4*. H. Hutchinson of London. 5*. E. H. Dawson of Lancaster. 6*. Horace Helsdon of London. 7*. J. Borrowman of Godalming. Second Class. W. D. Claridge of London, G. P. G. Hills of London, H. C. Lander of London, T. H. Winny of London. Third Class. C. E. Bateman of Birmingham, T. H. Hitchin of Nottingham, A. B. Jackson of Putney, E. H. Sim of London, B. E. M. Towne of London, F. J. Waller of Greenhithe, W. W. Wilson of Leytonstone.——Science. Donaldson Silver Medal. L. Martineau of London. Second Prize. E. Hellicar of Bromley. Certificates, 3*. H. Hutchinson of London. 4*. E. A. Rüntz of London. 5*. G. P. G. Hills of London. Second Class. W. S. Douthwaite of Sydenham, R. J. Durley of London, W. C. Kerr of Blackheath. Third Class. G. Baker of Oakham, C. E. Bateman of Birmingham, E. H. Dawson of Lancaster, R. C. T. Gordon of London, A. Griffin of London, R. S. Maynard of London, G. Roberts of Portmadoc, F. C. Stainton of London, T. H. Winny of London, A. B. Yeates of London.——Modern Practice. Prizes, equal. R. C. Gordon of London, Alfred Griffin of London. Certificate, 3*. E. A. Rüntz of London. Second Class. E. J. Slow of London, T. N. Turner of London. Third Class. A. B. Clement of London, L. R. Ford of London.

We are requested to state that students can obtain their worked papers of answers on application to the professor at 10, Lancaster-place, Strand, within the present month (July).

* Obtained the number of marks qualifying for a prize.

ENGINEERING POPULARLY CONSIDERED.*

THE author has tried to make the theme of his book interesting, and he has to some extent succeeded. But can engineering ever be made popular? We very much doubt if it can; there are so many technicalities to master, and these cannot be so familiarly explained or converted into plain English like they can in other subjects. Mr. Haldane narrates in a pleasant manner his experience as an engineer; a brief sketch of steam navigation, canals, and railways introduce the reader to the early history of engineering enterprise. The experiments of Fairbairn and Hodgkinson, on the Britannia Bridge calculations, are briefly noticed; and the great engineer, Sir Joseph Whitworth, and his work is spoken of; but the chief chapters of the book are devoted to a kind of personal narrative of marine engineering from 1852, when our author had been apprenticed to Denny and Co. Much of interest will be found in this recital of personal experiences and events, though some of the chapters read more like an autobiography than a popular book on engineering. Mr. Haldane describes several establishments and the business carried on in them; such as the Birkenhead Ironwo ks, in which he was engaged. He also points to the difference between the workshop practice of 30 years ago and that of to-day. Then manual dexterity was required, whereas now machinery has taken the place of manual skill. The drawing office is the only means of getting on in the higher ranks of engineering. Very useful advice to the intending student will be found scattered through the volume, that will help him to form a proper judgment in the adoption of engineering as a profession. Very much like that of architects, it is overstocked, and many young men obtain admission who are either worthless or are quite incapable, but who get taken by firms through influence or money. The premium system has its failings in engineering as in architecture; it encourages mediocrities, while it is unfair towards the really energetic and studious; the pupil is favoured at the expense of the real working assistant. The author enters rather fully into the subject of apprentices, the different kinds of young men, how they are installed into works, and the favour shown to those who have paid premiums. The chapter on "Civil Engineering" deals with sundry questions. "How I Commenced Private Practice" is an interesting record that may be usefully perused. The author advises the young engineer to acquire some knowledge of other branches besides that in which he has been chiefly brought up; thus railway engineering is more extended and gives more scope for employment than locomotive engineering. "How Competitions are Conducted" is the heading of a chapter; another is on "Clients," a third on "Professional and other Books, and a Retrospect of the Art." Mr. Shone's hydro-pneumatic ejector for raising sewage and liquids is mentioned as one of the chief applications of compressed air. The work is illustrated by photographic and other views, and contains in a gossipy form much general information.

* Engineering Popularly and Socially Considered. By J. W. E. HALDANE, C.E., M.E. London: E. and F. N. Spon.

JUBILEE MEMORIAL FOUNTAIN, ST. MARY'S BUTTS, READING.

[SEE ILLUSTRATION.]

THE foundation is of concrete, which is taken down some distance below the road, to allow space for a subway, which is constructed from one side to the other, so that access can be had to any portion of the interior when required. A separate pipe and tap is used for each water supply, and the water can be drawn out of each pipe and basin and the whole left dry before the commencement of winter to prevent the action of frost. The lower basin is oval, and occupies the whole of the space allowed. The north and south ends are paved with Wycombe paving, and at each of the four corners are red granite guard piers. It is the intention of the Corporation to place eight additional granite guard posts, with iron railing and gutter, to protect the fountain from being damaged by cattle, &c.; but owing to the great difficulty in obtaining the granite in time the posts are not yet fixed. The moulded plinth coping, &c., is of solid Portland stone, and at the north and south ends drinking basins are sunk in the coping, and provided with cups and chains. The overflow from the basin is used to supply a stone trough for dogs below. From the centre of the lower basin is raised a block of masonry, the external portion of which is composed of alternate bands of red Mansfield and white Portland stone, the central band having carved ornamentation representing the English rose, and the upper band water lilies in various stages from the bud to the flower. At equal intervals round the central block are eight polished Peterhead red granite columns, with carved capitals, each one being of a different design, the whole supporting a beautifully carved and moulded frieze, which forms the second basin; running round the frieze in bold relief letters is the following inscription:—"Erected to commemorate the 50th year of Her Majesty's reign, 1887." Above the inscription is a carved band representing the Shamrock and Thistle; at equal intervals between each column are eight carved gargoyles or grotesque heads, each one of a different design, and from the mouth of each a flat sheet of water is discharged into the basin below. From the centre of the second basin is raised a small oval block composed of bands of red Mansfield and Portland stone, surrounded by four small columns of polished granite, with carved capitals supporting a solid oval brown Portland stone, which is surrounded by 20 small water jets, each one playing up the stone and falling back over the edge below. This stone is encircled by a band of carving representing the British oak. On the top of the stone is placed a single polished red granite column; this is surmounted by a carved capital on which are two lions back to back, each with a shield, one bearing the Royal Arms and the other the Borough Arms, the side spaces being filled up with carved water lilies, bulrushes, &c. From the centre of the lions rises a white stone carved finial, which is finally surmounted by a beautifully carved crown and coronet, from the centre of which is the top water jet. A strong copper pipe is carried up the centre, so that the wind cannot affect the stability of the upper portion.

The whole has been carried out from the designs and under the superintendence of Mr. G. W. Webb, A.R.I.B.A., 14, Friar-street, Reading, whose design took the first place in the competition. The contractors were Messrs. Wheeler Bros. The fountain was opened on Saturday, June 18th.

ARTHUR HAYBALL.

THE Sheffield papers announce the sudden death, upon Monday, the 27th ult., of Mr. Arthur Hayball, of that town, architectural woodcarver, at the age of 64 years.

Mr. Hayball was the son of a builder of that name, who carried on business in Rockingham-street, Sheffield. His tastes were intrinsically and pre-eminently artistic; so, being too delicate to follow the ordinary routine of his father's bench, he was allowed to pursue the bent of his inclinations, and thus it came about he occupied his youth in modelling and carving. When of age he joined the then recently-formed School of Design, to which, both as student, and afterwards as a master, he continued to be more or less intimately attached for the succeeding 43 years of his life.

For many years Mr. Hayball's studio was in Hanover-street, Sheffield, and it was there the writer of these lines, some 30 years or more ago, first went as an ambitious apprentice to learn "the mystery and craft of a carver." Mr. Hayball at that time was not only an accomplished sculptor in wood, but was also no mean artist in photography, and in the latter pursuit (he did not touch portraits) was far ahead of most knights of the camera. His mechanical, as well as artistic, genius was also conspicuous, in that he, as a rule, always (in those days) made his own tools; often apparently wasting hours of valuable time in forging little chisels or gauges that the expenditure of a few pence might have bought at the nearest ironmonger's.

His work is scattered throughout England, Ireland, Scotland, and Spain, and with the Roman Catholic section of the Christian Church in particular, he found great favour. The good old firm of Messrs. Weightman, Hadfield, and Goldie, architects, of Sheffield, kept him almost continually going in their time; and amongst his innumerable works that are, at the moment, recalled to one's mind, the cleverly sculptured oak stalls at Mr. Goldie's famous church of St. Wilfred, at York, may be mentioned as typical of the recently deceased artist's skill. He also did a deal of work for successive Dukes of Norfolk, and the fittings in their chapel at Arundel are by him. About 20 years ago he built extensive premises, and a residence adjoining, in Cavendish-street, Sheffield, and there he stayed the remainder of his life. HARRY HEMS.

BOOKS RECEIVED.

Building Estates: a Rudimentary Treatise on the Development, Sale, Purchase, and Management of Building Land, &c. By Fowler Maitland, Land and Engineering Surveyor. 2nd Edition, revised (London: Crosby Lockwood and Co.)—The second edition of this little book, which we have before noticed, has been revised. Mr. Maitland writes as a practical man, and brings to his subject the necessary information on legal and other matters. We cannot share in the opinion that the immense growth of towns is due to industries. The increase in house-building is far more than necessary to meet the demand of tenants, as may be seen in the suburbs of London, where only about 20 per cent. of the new houses are tenanted. It is more to the point to say that house-building is a business in which the house agent, the landowner, and the speculative builder are interested, and the demand for building-land is much greater than the demand for dwellings. The purchase of land is too often regarded

as a profitable speculation. The author has written a well-arranged treatise, and gives a summary of the provisions of the Public Health Act bearing upon new estates, which will be found useful. The by-laws issued by the Local Government Board for the guidance of urban authorities are important to the surveyor engaged in developing estates; the clauses referring to the deposit of plans and sections by persons intending to lay out streets and in the preparation of drawings, the sufficiency of space about buildings, &c. Under these provisions no house shall have less than 150 square feet of yard space at the rear free from any erection thereon above the level of the ground except a water-closet, earth-closet, or ashpit. The distance from every part of such house to the boundary of any lands or premises opposite or adjoining to be not in any case less than 10ft., and to be regulated according to height. The author also refers to the clauses amending the Metropolis Management Act, by which a sliding scale is adopted, the open space varying with frontage. We have pointed out the unreasonableness of this rule, which gives the house with narrow façades the same depth of area as those with wider frontages. The mode of laying out the land, and suggestions for the preparation of the plan of the roads are discussed. The question of deciding upon the size of the plots is one of more importance than it is often considered to be; the greater the value of the land, the less area being given. The effect of this principle is to overcrowd suburbs and to drive the wealthier classes farther out. Some useful advice is given on laying out plots to avoid monotony and straight streets, and the engravings illustrating laying out roads and hilly ground are worth notice. Many new estates are irretrievably spoiled by inattention to levels and contours which can never be properly studied in the plan or on the flat surface. Surveying operations, construction of roads and sewers, land tenure agreements and leases, prices and valuations, and an appendix in the book containing clauses for leases, forms of agreement, and other useful information, a specification of streets and sewers will be found.—— *Practical Solid Geometry*, by William Gordon Ross, Major Royal Engineers, &c., Royal Military Academy, Woolwich (London: Cassell and Company), appears to be a well-arranged compendium for elementary study embracing the more practical problems. Having entered upon the definitions of orthographic projection, lines, and planes, the author explains the method of vertical indices—a principle of orthographic projection which deals with only one of the co-ordinate planes, the other information with regard to the other plane of projection being obtained by means of a series of numbers or "indices." Thus a straight line is fully determined if the planes of two points in it are figured; so also the inclination of a line to a horizontal plane is obtained by taking the difference of the indices of any two points on it, and comparing the difference in level with the horizontal distance given on the plan. The more useful problems of solid geometry, sections of solids by planes, and interpenetration of solids are dealt with. Problems relating to irregular surfaces and the defilading of works of fortification; isometric projection, shading, and hints for draughtsmen are among the other subjects referred to by Major Ross—— *Illustrations of Old Ipswich*. By John Glyde, author of "Suffolk in the Nineteenth Century," &c. Part IV. of this work has reached us. The subject of description and illustration is the Old Coffee House in Tavern-street—one of the finest specimens of half-timbered residences of the middle of the 16th century, which still existed up to the beginning of the present century; indeed, as late as 1815. The autogravure representing the old house is taken from an old sepia drawing, and gives a fair idea of the carved angle-post, which formed so prominenta feature of the building. Mr. Glyde's description of this house is worth quoting. He says:—"While half-timbered houses of the 15th, 16th, and 17th centuries are to be met with in other parts of England besides East Anglia, very few examples are known in which the ornamentation compares with that of the structure under notice. That which most closely resembles this old coffee house is the 'Market House' at Hereford, bearing the date 1621. . . . Like the Ipswich building, it has three stories and three gables, the latter having deep barge boards carved with the familiar vine leaf, and without either hip knobs or pendants. The return gable at the end of the house, as at Ipswich, is more highly ornamented, and on the first floor over the shops are bay windows of exceedingly slight projection filled with diamond quarries. This indicates the original treatment at Ipswich. The pitch of the roof is nearly the same, and from it springs a brick chimney. The half-timbering, as usual in the West of England, is more pronounced than in East Anglia." The author minutely investigates the question of date to be assigned to this carving. Taking into account the rather high pitch of the gabled roof, the character of the barge boards, which are straight-edged, decorated with the vine leaf, the form of the doorheads, and other details, he arrives at the conclusion that the Old Coffee House was erected in the middle of the 16th century. The angle-post was, it appears, a peculiar feature of Ipswich, many of the houses having been once enriched by it, and some still remain. Other examples are to be seen at Lavenham and Coventry. The carvings on this particular angle-post are rather coarse, and represent four tiers of figures of grotesque character. The Three Graces and a Bacchanalian figure above occur in each story, the former being grouped standing on pedestals. This fine example of 16th-century architecture was demolished to make room for street improvements. Mr. Glyde's narrative is interesting.

CHIPS.

The foundation-stone of St. Martin's Episcopal Mission Chapel, Polmadie, Glasgow, was laid on Saturday afternoon. Designed by Messrs. M'Kissock and Rowan, architects, the building is 12th-century Gothic, simply detailed. It is seated for over 200 persons, and is arranged as nave, choir, and sanctuary.

The New Zealand Government intends to borrow £2,000,000 to complete the main railways of the colony.

On Saturday a demonstration by the trades and societies of Coatbridge took place in honour of the opening of the new public park, 23½ acres in extent, situated at the east end of the town, and presented to the burgh by Mr. William Weir, of Kildonan, as also the inauguration within the park of a bandstand raised by public subscription, and of a drinking fountain presented by the trades of the town.

The cemetery at Elswick, near Newcastle-on-Tyne, is about to be enlarged from plans prepared by, and under the superintendence of, Messrs. Stockwell and Spicer, of Barras-bridge, Newcastle.

The church of Tansor, near Oundle, a structure of the 12th and 13th centuries, which had been restored under the direction of Mr. Ewan Christian, at a cost of £1,900, has been reopened by the Bishop of Peterborough. Mr. Wade, of St. Neot's, Hunts, was the builder.

The parish church of Burley, Hants, built fifty years ago, was rededicated by the Bishop of Winchester on St. John the Baptist's Day, the anniversary of its opening, after having been added to and altered, at a cost of £1,600. The new chancel is 16ft. by 15ft., the organ chamber 11ft. by 8ft., and the vestry 14ft. by 10ft. The decorations of the walls and roof of the chancel are chiefly handpainted. A new pulpit of oak and walnut, with a base of Portland stone, has been provided, as have also new choir stalls. The east window is a two-light one, filled with Gothic tracery. The architect is Mr. W. Butterfield, of London, and the builder Mr. Joseph Norris, the work having been carried out under the superintendence of Mr. J. S. Shiner.

The Executive Committee of the Brixton Liberal Association have unanimously recommended Mr. James Hill, of Clapham-road and Queen Victoria-street, president of the association, well known to our readers as a lock merchant, as the Gladstonian candidate, subject to his acceptance by the Liberal Four Hundred. Mr. Hill has consented to stand should his candidature be approved.

At a special assembly of the Society of British Artists, held on Monday evening, Mr. Alfred Stevens was elected a member.

On Saturday last the corner-stones of a new Conservative Club for New Mills, near Manchester, were laid. Messrs. J. Brown and Co., Hyde, are erecting the building on Union-road, a central situation between New Mills and New Town, from the designs of Mr. H. Wyatt, architect, Marple. It is expected to cost about £1,000.

OUR COMPETITORS' COLUMN.

THE response to our sixth invitation, to "name the leading British architect," has been remarkable for the almost unanimous voice with which our readers have responded. Rather more than 90 per cent. of the suffrages are for Mr. Alfred Waterhouse, R.A., and it is evident that his popularity as *primus inter pares* is as extended as, we venture to add, in our own poor opinion it is well deserved. The papers sent in giving a summary of his works are comparatively few in number; but they are all characterised by a warm appreciation of his character and abilities, if they are somewhat unequal in their criticism of his work. Altogether, we think the best is by

Mr. Wm. Eaton, 10, Botham-street, Moss Side, Manchester,

to whom we award the prize.

A further prize of One Guinea is offered for the best series of

HINTS ON ARCHITECTURAL DRAUGHTSMANSHIP

to be sent in by Friday, July 8.

Another prize of One Guinea for the best

SUGGESTIONS TO ARCHITECTURAL SOCIETIES

for sessional papers next year, with hints as to subjects most appreciated by members, illustrated, if desirable, by references to and comparisons with past papers.

To be sent in by Friday, July 15.

And another prize of One Guinea for the best short essay, naming the architect who, during the past thirty years, has

MOST DECIDEDLY INFLUENCED ECCLESIASTICAL ARCHITECTURE IN ENGLAND.

To be sent in by July 22.

THE LEADING LIVING BRITISH ARCHITECT.

Although many great architects have been removed from our midst during the last few years by the hand of death, yet still we may claim to have some remaining who, by the magnitude and number of their works, have proved themselves to have been worthy of the great praise bestowed upon them, not only by the architectural profession, but by the public in general.

Foremost among these we must class Mr. A. Waterhouse, R.A., who, by his design for the Manchester Town Hall and other works of importance, must certainly rank as our greatest living architect. There may be architects who have produced better designs in a certain class of work, or who may have made certain buildings their special study; but, taking the works of our great architect as a whole, it must be admitted he is at present without a rival. Take the Manchester Town Hall, for instance, as a Gothic building, and it must be acknowledged that there is no public building in England, in the same style, which will compare with it, both in magnitude and beauty of design. Certainly, there may be defects in the composition of its elevations—though what façade is there but which professional critics think they could improve upon if they had it to design?—but, take the building as a whole, it must be admitted as a splendid composition, while, considering the awkwardness of the site, the plan is excellent, and shows that great thought and trouble have been expended upon its production. In the interior, the elegant staircases, which have open and arcaded well-holes, are greatly to be admired; while the angle elevation at the junction of Princess-street and Albert-square, with its projecting oriel, shows effective treatment, and is undoubtedly one of the best features in the whole composition.

Of other public buildings in Manchester, the Assize Courts, designed in 1862 and finished three or four years later, ranks foremost among the Gothic buildings of the day, and although rather different in design to the town hall, is quite as effective in its way, and does great credit to the able designer, Mr. Waterhouse. Owens College, Manchester, was commenced in 1871 and completed two or three years later. The buildings are in the Gothic style, and are excellently arranged, showing a thorough mastery of the arrangements and details necessary for such a college, and few buildings adapted for such purposes can compete with it. Mr. Waterhouse has shown that this style of building need not have that gloomy and monastic air so inseparably connected with it, as we see at Oxford and else-

where. The new portion now erecting, but not completed, fronts Oxford-road, and is a fine piece of architecture, the skyline being well broken, and the whole façade being enhanced by a bold and well-designed tower, very picturesque in appearance.

The Natural History Museum, London, shows what may be accomplished by the use of terra-cotta, and as a Romanesque design, will bear comparison with any building in England of its class. Its main entrance is singularly grand and noble, whilst the building itself swarms with creatures as full of vigorous life as the sculpture of a Mediæval church.

The National Liberal Club, London, recently completed, is in the Early Renaissance style of architecture, the breadth of treatment in the design being admirable, the façade being well emphasised by balconies, which are arranged between projecting bay windows.

The BUILDING NEWS, in 1874, criticising the architecture at the Royal Academy, and alluding to Mr. Waterhouse's design for additions to Eaton Hall, says :—"We now come to what will be, in the eyes of architects at least, the most remarkable drawing of the year. Mr. Waterhouse is a master of the art of planning, and it is no wonder he has chosen to show this specimen of his skill. The architect's style is a well-known one, and his peculiarities are strongly traceable here. The skyline is admirable, except perhaps a clock tower, which, to our notions, presents very unstudied forms. The treatment is Gothic, with a very sparing use of cusps, and the whole aspect of the work does not seem inconsistent with modern uses and nineteenth-century ideas."

St. Elizabeth's Church, Reddish, near Manchester, which was erected some few years ago at the expense of Sir W. H. Houldsworth, Bart., M.P., is a masterly design of Mr. Waterhouse's, in the Romanesque style, and is faced for the most part with brick.

Of other important works erected by Mr. Waterhouse must be mentioned the New Technical Schools, Kensington; St. Paul's School, Kensington; Shire Hall, Bedford; Yattendon, Newbury; the Prudential Assurance Company's Offices, London and Liverpool; Turner Memorial Hospital, Liverpool; Seamen's Orphanage, Newsham Park, Liverpool; New Courts, Lincoln's Inn, London; New Buildings, Balliol College; Gonville and Caius College, Cambridge; University Club, St. James's, London; Hampstead Congregational Church; Station Hotel, Liverpool; New Bank, Leighton Buzzard; and Yorkshire College, Leeds.

Not only has Mr. Waterhouse created a great name (which will be cherished for ages) by the production of magnificent designs for our public buildings, but his repeated appointment as judge or assessor in most of our recent large competitions is a proof that his name is held in high esteem and honour, not only by the greatest men in our land, but also upon the Continent.

WM. EATON.

10, Botham-street, Moss-side, Manchester.

CHIPS.

The foundation-stone of the new Victoria Jubilee buildings at the Hospital for Incurables at Dublin was laid on the 29th ult. by Prince Albert Victor. The buildings are to be on the pavilion system, and will include special accommodation for patients suffering from phthisis and other affections of the respiratory system. The wards will be sheltered on the north and east, and will be heated by hot-water pipes as well as by open fireplaces.

A bell, for which the claim is advanced that it is the largest in the world, has just been christened at Berlin by the Archbishop of Cologne in the presence of the civil and military authorities of the district. It is hung in the cathedral, and is called the "Emperor Bell." It received the name of "Gloriosa" at the christening.

A memorial drinking fountain in the centre of the village of West Coker, near Yeovil, was opened on Coronation Day. It is constructed of Ham Hill stone, and consists of a canopied spire of Somersetshire type. Messrs. C. and C. B. Benson, of Yeovil, were the architects; and Mr. Eli Williams, of Montacute, was the contractor; the carving and sculpture were carried out by Mr. Harry Hems, of Exeter.

The first sod of a new lock on the Yorkshire Ouse at Naburn was cut by the Lord Mayor of York on the 30th ult. Mr. John Fowler is the engineer of the lock, and the contract has been taken by Messrs. Nelson and Son.

WAYSIDE NOTES.

THE discovery of the Great Temple of Bubastis, in Lower Egypt, is an event of somewhat similar interest to that of the finding of the Temple of Diana at Ephesus, brought to light by the researches and excavations of the architect, Mr. J. T. Wood. The size of the Egyptian edifice appears to have been enormous; somewhere about 800 or 900ft. long, and 150ft. broad, and in general it is said to verify the description of it given by Herodotus, about three-and-twenty hundred years ago. Vast quantities of huge columns and statues of granite have been cleared of sand, and these include two colossal figures, the eyes of each measuring 7in. wide. The interest of watching excavatory works such as those now being carried on in Egypt must be most intense and absorbing to enthusiastic archæologists. It is indeed difficult to conceive anything more pleasant of its kind than standing by whilst a wealth of old granite columns are being unearthed, bringing to view handiwork that, possibly, may not have seen light for a score of centuries.

There is a very able article on this discovery in the *Times* of the 1st inst., which should be procured by all interested in old Egyptian architecture. And who is not interested, more or less, in the ruins of ancient Egypt? To myself there is no country that appears more fascinating in its history and architectural remains; and a stroll through the galleries in the British Museum, devoted to old Egyptian art, at all times affords me infinite pleasure. I like to linger before the old statues with their austere countenances, which may be perhaps described as the very embodiment of the abstract qualities of uncomplaining endurance and relentless determination, even as, in a like manner, the pyramid in the desert embodies the abstract attributes of solidity, endurance, and eternal durability in architecture. Certainly, a pyramid exhibits to perfection that principle of unity, the attainment of which has ever been the aim of all true builders.

Egypt is, perhaps, relatively less visited now by the architect than it was in the days when the "grand tour" was considered an essential part of his education. This is to be regretted, as such a visit cannot but greatly benefit architects, especially those given to depending too much on their detail for the appearance of their buildings, and who may never have awakened to the greater nobility of relying for effect on "broad sunshine and starless shade," as Mr. Ruskin has it. Of course, it is but the favoured few that will ever see the Pyramids and temples of the desert plains. Still we may all live in hope.

Anyone, however, who may be contemplating a visit to Egypt will be glad to learn that the newly-discovered Temple of Bubastis is very accessible. It is said to be about half a mile from Zagazig station, and within a few hundred yards of the railway that connects Cairo with Ismailia. Unfortunately for those who have the will and means to go to the country, it is a considerable distance off, and, moreover, there is something in its semi-tropical climate that is not altogether attractive to anticipate, although one ought to have been lately seasoned to high temperatures. Besides the heat, too, there is doubtless some risk just now in going amongst a people whom we have recently, as a nation, been slaughtering by their thousands; so, however tempting it may be to read about the unearthed ruins of the magnificent temple, it is probable that we shall not, many of us, rush off to "Cook," to be personally conducted to see the "fine squatting statue in black marble of Prince Menthuherkhopeshef."

On Monday last I took the first opportunity of inspecting the new staircase and galleries at the National Gallery. As regards the vestibule as now arranged, one can only conclude that the authorities have further plans for the future, since all must be struck with the decidedly unsatisfactory nature of the main entrance. By contrast to the grand new staircase, this now appears mean and too small for the purpose; and on "high days and holidays," as an official pointed out, there would be a very uncomfortable crush at the doors to the side staircases. Could the three small walls that form the entrance hall be done away with, a fine architectural effect would be made by the three flights of stairs. Apparently the only sacrifice necessary to obtain this effect would be that of two little nooks for taking sticks and umbrellas. As, however, such an arrangement must have been evident to all, it was probable that it was not considered so practical and convenient.

Pilgrims to the great work of Raphael, lately purchased at such an enormous cost, have now a more impressive approach to their shrine. The picture ranges with the new staircase and centre doors of the galleries that intervene between it and the main entrance. There appears to be now a good deal of space to spare on the walls of the altered National Gallery. Many of the old remaining rooms, by contrast to the new work, appear to sadly want cleaning and redecorating.

In the matter of pictures, I regret to see that Mr. Editor fears the little black and white reproductions of the more notable pictures of the year's R.A. exhibition do not meet with the universal approval of readers. I trust that a more extended poll of subscribers would not confirm the suspicion. For there must be many of us who keenly appreciate such charming little sketches as "An April Day," and, indeed, all the others that we have had. We all know that it is the thoroughly practical nature of the BUILDING NEWS illustrations that has won the journal such world-wide renown, and we like to find drawings and plans of buildings when we take up a building journal. Many of us, doubtless, feel somewhat irritated if, when we expect practical information, we pull out of our papers a yard or more of figure drawing that would be all very well in an artist's (pure and simple) or decorator's paper, but which soon brings a feeling of surfeit on the average and mortal architect. But the BUILDING NEWS appears to have ever guarded against this sort of thing. Long may it continue to do so!

It is probable that we all like best carefully measured drawings of old work, and the larger the scale of these the better; and we could also do with more geometrical drawings of new work. Of course, we cannot expect to be always having old measured work, and practical pans, elevations, and sections, and it is difficult to see why an occasional, and at the most a weekly, page of pretty and artistic black and white drawings should not be duly appreciated. I, for one, should be sorry to see the practice discontinued.

Coincident with the re-opening of the National Gallery was the laying of the foundation-stone of the Imperial Institute. The ceremony appears to have been pretty and interesting. There seems to have been considerable dissatisfaction expressed at the result of the competition—that is, as far as the selected building goes; but as to the selection itself, I have not seen many actual complaints. This is not surprising, considering the eminence of every member of the committee that had the awarding of the prize. It is seldom that persons of such repute decide competitions for the profession. Most of the ordinary building committees are composed of none more capable of judging the merits of a set of plans than local tradesmen.

I would point out to the young competing architect that the exhibition of the designs at Kensington was most instructive as regards planning. There were three varieties of plan—the monumental plan, the business-like or common-sense plan, and the undignified or domestic plan. Messrs. Deane's design exhibited the first class, as it evidently sacrificed convenience to appearance. Mr. Collcut's plan, which was unquestionably the best and simplest, and by reason of its studied symmetry retains an air of monumentalism, typifies the second class of plan. Messrs. R. Row and Anderson's and T. G. Jackson's exhibits are examples of undignified planning, however convenient they may be in working. Moral for competitors:—Of two plans, equally convenient in working, submit that which to the eye appears most beautiful.

GOTH.

Building Intelligence.

DARLINGTON.—The new station at Darlington was opened on Saturday, when a new branch of railway from Darlington to Fighting Cocks was utilised for passenger traffic. The plans for the station have been drawn by Mr. W. Bell, the architect to the North-Eastern Railway Company, the contractors being Messrs. W. Scott and Co., Newcastle, and James Thompson, Leeds; and for the ironwork, Messrs. Butler, Stanningley. The roof is of three spans, each 60ft. wide and 1,000ft. long, and supported by iron pillars. The station is on the "island" principle, with dock at the south and bays at the north end. The block of buildings includes offices for station master and assistant, waiting rooms for the various classes of passengers, large booking hall for porters, guards, &c., refreshment rooms, offices for telegraphy, &c. Lavatories are at each end. The principal front of the station is to the west, and a lofty clock tower faces Victoria-road. Carriage entrances are there and at the north end, where there is a large covered cab-stand.

DROITWICH.—St. Andrew's brine baths were opened on Tuesday week. The building is a parallelogram on plan, and consists of an elevated central hall, 55ft. by 27ft. 3in. (in which is the plunge bath), with private bath and dressing rooms ranged on either side, one side being for ladies, the other side for gentlemen. Architecturally, the building is of an Renaissance character. It is faced externally with pressed buff-coloured bricks, the plinth being of red pressed bricks, and the gables of half-timber construction, framed in oak. The sides of the plunge bath hall are carried up and finished as clerestories above the roof of the adjoining bath and dressing rooms. The architect is Mr. John Cotton, of Birmingham and Bromsgrove, the contractors being Messrs. Huins and Sons, of Redditch.

ELLAND.—The corner-stones of the new Town Hall were laid last week. It is about to be erected from the designs of Mr. C. F. L. Horsfall, Halifax, who, it will be remembered, was awarded the first place in the recent competition. The style is Classic, and the building will occupy a position of vantage at the junction of Southgate-road with Huddersfield-road. The large hall will be 100ft. long by 46ft. wide, and 30ft. high. There will also be a gallery 46ft. wide and 20ft. deep. The total accommodation will be for 1,050 persons. The scheme also includes shops and a hall-keeper's house. The accepted tenders amount to £5,666, the work being let to the following:—Mason and bricklayer, Mr. T. Pickles, Luddenden Foot; carpenter and joiner, Mr. Joseph Wilson, Elland; plumber and glazier, Mr. Joseph Aspinall, Elland; plasterer and slater, Mr. A. Anderson, Brighouse; ventilator, Mr. B. Hainsworth, Halifax; ironfounder, Mr. James Mackrell, Elland; painting, Mr. Jonas Binns, Halifax; and heating, Messrs. S. and W. H. Jagger, Elland.

HAMMERSMITH. — The chancel, morning chapel, lower part of tower, and the vestries and organ chamber of this church, which is one of the largest and most imposing of modern ecclesiastical buildings in the diocese, have just been completed from the designs of Mr. Hugh Roumieu Gough. The consecration took place on Saturday last. The building is now complete, with the exception of the upper part of the massive and lofty tower, and this is in the course of erection, and will, if funds permit, be finished about the end of the year. Messrs. Chamberlin Bros., of Hammersmith, have been the contractors. The church, which measures externally 183ft. in length and 67ft. 6in. in breadth, with a height of 76ft. from ground to nave and chancel ridge, consists of nave, with an octangular western baptistery, 18ft. 6in. diameter; north and south aisles, each having large porches towards the west end; chancel, with large morning chapel on the south side with accommodation for about 70 worshippers; organ bay and tower on the north side, a clergy vestry being provided in the ground-floor of the same; and a large choir vestry, 34ft. by 14ft., at the east end. The materials employed are red Mansfield stone externally and Ancaster internally. Boxground and Corsham stone is used in the dressings, supplied by Messrs. Randell and Saunders, and Mr. Yockney furnished the blue Bath stone for the arches of the arcades, &c. The moulded columns are of polished Belgian "granite," and the caps and bases of the same material. Leopold marble, from the Luxembourg district, has been used for the chancel screen, as also for wall lining in the chapel and for choir steps, &c. Some very beautiful specimens of polished Devonshire marble are employed as steps in the sanctuary and in the columns of piscina and sedilia, these latter being the gift of the architect. This marble is from the quarries of Messrs. J. and E. Goad, of Plymouth, who have also supplied the whole of the columns for St. Cuthbert's Church, Kensington, in course of erection, also from Mr. Gough's designs. The paving of the gangways in nave and aisles, porches, &c., is of Rust's vitreous mosaic, and in the chancel and chapel of Homan's Venetian marble mosaic. The seating throughout the nave and choir is of teak. The iron roof, which has more than once been noticed in our columns, is not seen, being above the barrel vault. It is of novel construction, and was introduced by the architect as an economical and efficient means of avoiding tie-beams. The ornamental ironwork has been supplied by Messrs. Jones and Willis. The church will accommodate nearly 1,300 worshippers, and the cost, when complete, with its furniture, &c., will be between £20,000 and £25,000.

LONDON.—The council of the Royal College of Surgeons of England decided last week to expend at present not more than £50,000 of the Erasmus Wilson bequest. The report of the committee on the extension of the college premises approved and adopted at the previous meeting was confirmed. It contained the following recommendations:—"That the library be enlarged by pulling down the house No. 39, Lincoln's Inn-fields, at present occupied as a residence by the conservator, and that the space thus gained be added to the library, in the manner suggested by the architect, at an approximate cost of £2,500; and that the house No. 38, Lincoln's Inn-fields, now occupied as chambers on annual tenancies, which is in a most unsatisfactory condition, be also pulled down and be converted into a residence for the conservator." The report of the colleges' land committee, consisting of delegates of the two colleges, on the question as to the desirability of utilising the vacant ground adjoining the examination hall for "scientific purposes," under the control and management of the two colleges, was approved and adopted. It was as follows:—"1, That a central theatre for lectures and demonstrations should constitute a part of the proposed additional buildings; 2, that the central theatre should be built so as to contain seats for an audience of about 250 persons; 3, that the plan submitted by the architect be, in its general arrangements, adopted; 4, that a sub-committee be appointed to investigate and report within four months upon the best arrangements at present existing in scientific institutions in the construction of a lecture theatre and laboratories."

OLDHAM.—New buildings for the use of the Salvation Army in Oldham have just been inaugurated. They are situate in Union-street, and the accommodation comprises a large main hall to seat 3,000 persons, a smaller one intended for week-night services capable of accommodating 900 persons, a shop, several retiring rooms, bandsmen's rooms, boiler house, heating chamber, and the usual necessary appurtenances. The front is of red brick, with stone dressings, with a tower running up each side of the main hall, finished with battlements. Tudor Gothic has been adopted for the architectural treatment. The contractor was Mr. Councillor Holt, of Cheetham, Manchester. The brick and stone work was carried out by Mr. Thomas Whitehead, of Failsworth, Manchester. Mr. J. Williams Dunford acted as assistant architect. Mr. E. J. Sherwood, of 101, Queen Victoria-street, London, E.C., was the architect. The entire block covers an area of 12,250 square feet, and the cost has been about £5,570.

PEMBROKE. — The parish church of St. Michael was reopened on the 14th ult. after a complete re-casting of the body of the church, which was rebuilt some 80 or 90 years ago, and was about 40ft. wide and covered with a tie-beam roof and flat plastered ceiling. Opportunity has been taken of the walls being sound to create two naves of equal width, the north being a restoration of the 14th-century one, the foundations of which were discovered in forming those of the arcade piers. A new and handsome constructional chancel has been formed of its eastern portion. The dual naves have met with the approval of the Bishop and Church Building Society, and the result has proved very satisfactory both as regards sight and sound. Two new porches have been built and other improvements effected, the total cost being £1,800, the contractor being Mr. H. Edwards, of Milford, and the architect Mr. E. H. Lingen Barker, of London, Hereford, and Swansea.

RINGLAND.—The Church of St. Peter, Ringland, Norfolk, was reopened on June 29th, 1887. The nave roof has been repaired, the aisle and porch roofs renewed, and the leadwork relaid. The seats in the nave are of oak, and the floors of pitch pine. The original glass in north clerestory, representing donors and the figures of Gabriel, St. John the Baptist, and the Virgin Mary, have been refixed. The tower is now being repaired, and when the pulpit, reading desk, and chancel seats are complete the entire cost will be about £2,000. The works have been executed by Mr. Wegg, of Norwich, from the designs of Mr. E. Preston Willins, diocesan architect.

SWINDON.—The memorial stone of the Victoria Hospital was laid at Okus on Tuesday week. The hospital is designed in the Late Gothic style, and will be built of brick with Bath stone dressings. The exterior will be plain but substantial. The portion which, on the erection of another, will be the centre gable, has a panelled centre, whereon will be placed a bust of her Majesty on a pedestal. It is intended at first to provide an accident ward, an operating room, and ten beds, another wing being added hereafter. At present the hospital will contain on the ground floor an entrance hall, waiting-room, medical officers' room, kitchens, offices, space for lifts for accidents, nurse's room, ward scullery, bath room, and a ward for five beds. The first floor also has provision for five beds, operating room, and accident ward. The wards will be laid with Lowe's wood block flooring, and lighted with the Wenham lights. The means of heating will be by open fireplaces. Mr. W. H. Read, M.S.A., of Swindon, is the architect.

WASHFORD PYNE, DEVON.—The chancel of the parish church was reopened on Wednesday week after restoration. The chancel has been restored on the old lines, and the east window (the only original window remaining), dating from the 13th century, has been retained. A new roof of oak, boarded and ceiled internally, and reslated externally, has been put on the chancel, and a new two-light window inserted on the south side. The choir seats are of oak, and the chancel is laid with Maw's tiles. The nave and transept were rebuilt, and the tower restored and raised, some four years since. The contractor for this portion of the work is Mr. J. R. Gibbard, of St. James's, Exeter, who also did the rest of the church; and the architect for the whole is Mr. R. Medley Fulford, F.R.I.B.A., M.S.A., of The Close, Exeter.

WIMBLEDON.—The Roman Catholic church of the Sacred Heart, Edge-hill, Wimbledon, has just been opened. It will consist of nave, aisles, chancel, side chapels, sacristies, organ chamber and choir school, and will be completed at the west end by a large and massive tower. Only the nave alone is at present built, the arches of all four sides being temporarily closed by brickwork. This portion of the building is 100ft. long by 29ft. wide and 67ft. high from floor to ridge of roof. It is divided into eight bays with clustered columns and moulded arches, which will open into the future aisles. The spandrels between the arches are alternately filled by niches for figures and sunk and moulded trefoils. Above is a range of three light flowing tracery windows with internal stone arches and angle columns. Engaged wall shafts support the arched principals of the roof, the boarded ceiling of which is divided into panels by moulded ribs. Supporting the wall shafts to the roof are a series of angels displaying the instruments of the Passion of our Lord. Across

the chancel arch is carved the beam supporting the rood, on which stand figures of our Lord, the Blessed Virgin, and St. John, together with St. Mary Magdalene at the foot of the cross, and two seraphim on either side. A temporary chancel is formed in two bays of the nave. The permanent high altar is temporarily erected against the bricked-up chancel arch. It is of plain stone with dark marble slab for the table, while the candle ledge, super-altar, and benediction throne are of white alabaster. When the altar is permanently erected it will stand under a stone baldacchino, supported upon four clustered grey marble columns. The seating is of unvarnished pitch pine specially designed; and the floor consists of an oak block pavement. The style is Decorated, and the materials used are, externally, knapped flints for walling, with Ancaster stone for the dressings, while the interior is almost entirely carried out in Beer stone. The roof is covered with Broseley tiles. Mr. Frederick A. Walters, F.S.A., of Great Queen-street, Westminster, is the architect, Mr. Wilson is the clerk of works; the contractors are Messrs. Goddard and Sons, of Farnham and Dorking, and the carving and sculpture are by Mr. J. McCulloch, of 384, Kennington-road. The church is heated by Grundy's hot-air apparatus. The cost so far has been £8,000, and the accommodation is for 400 persons.

CHIPS.

The parish church of Wellington, Salop, was reopened on Tuesday week after restoration effected at a cost of over £1,500, the working including reseating in pitch-pine over oak block flooring and reconstruction of the roof. Mr. Nicholson, of Hereford, was the architect; and Mr. Cullis, of the same city, the contractor.

Major Tulloch, Local Government Board Inspector, held an inquiry at the Guildhall, Worcester, on Friday, with reference to an application of the town council to borrow £5,336, for purposes of street improvement. The inspector was informed that £1,650 was required for purchasing some property for widening St. Swithin-street, and £3,680 for laying pavement, kerbing, and channelling a number of streets, many of them being in the area brought into the city by the Extension Act. There was no opposition to the application.

The Hastings town council have accepted as a Jubilee gift from Lord Brassey the building and reference library known as Claremont, and estimated to be of the value of £15,000. It is suggested that the library should form the nucleus of a free library, and the building used for municipal purposes as an adjunct to the new town hall.

The Bournemouth improvement commissioners have obtained the sanction of the Local Government Board to a loan of £17,000 for various purposes, including £9,000 for carrying out the scheme of watering the roads and flushing the sewers by means of sea water.

The Duke of Buccleuch is about to erect a memorial of his son, the late Earl of Dalkeith, on the spot on the hillside at Achnacarry, Invernessshire, where the young man lost his life in the autumn of last year. The monument, the execution of which has been intrusted to Mr. Dodds, sculptor, Dumfries, is to be of granite, in the form of a Celtic cross, from a design supplied by Sir Herbert Maxwell of Monreith, M.P.

The Ottley local board have been seeking for a further supply of water by cutting into a hill in Ellar Gill, and have struck a spring of water yielding 35,000 gallons per day. The water having been satisfactorily reported upon by an analyst, the board are laying down pipes to connect it with the town's supply.

The documents and coins under the foundation-stone of the Imperial Institute are secured in a copper casket, massive and air-tight, 18in. in length by 7in. across, and of nearly similar capacity in depth, lined with velvet. It was locked by a golden key, specially designed for the purpose, which was handed to the Queen on Monday. The lid of the box has surmounting it the Royal and Imperial Arms with supporters, crest and motto, all blazoned in proper colours, the shield on the reverse bearing the inscription. The casket was made by Messrs. Chubb and Son.

A stained-glass window has just been placed in the chapel of Fettes College, Edinburgh, by old Fettesians, to the memory of the late Mr. David Alexander Bannerman. The window is in three lights, the tracery is filled with angelic figures, and the Scriptural incidents selected are from the life of David, and are typical of youth, strength, and friendship. The work has been carried out by Messrs. Ballantine and Son, of Edinburgh.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

PROPOSED ARCHITECTS' AND ENGINEERS' REGISTRATION ACT.

To the Editor of the BUILDING NEWS.

SIR,—The necessity of the proposed Registration Act having been questioned by one of your correspondents, perhaps you will allow me to call attention to the case of the recent fall of a building in Manchester, reported in the *Morning Post* as follows:

THE FALL OF A BUILDING IN MANCHESTER.—The inquest on the bodies of the three persons who were killed by the fall of a building in River-street, Hulme, on the night of Saturday, the 11th June, was continued yesterday before the deputy city coroner, Mr. S. Smelt.—Mr. John Reavy, the owner of the premises, who carried on the business of a boot and shoe merchant, deposed that originally the building was five separate shops, and that he had at different times had them all knocked into one. He was in the shop on Saturday night when the building fell, but escaped without injury. Before the building fell he heard a noise, and ran out with the customers and assistants. They afterwards re-entered the shop, and in another minute the building collapsed.—Patrick Mooney, a plumber, said he undertook about four years ago to superintend the alterations effected to Mr. Reavy's premises by a man named Davis. When the division wall was removed beams and columns were put in. He made no calculations as to what weight would be upon the columns.—Mr. F. H. Oldham, architect, said he had examined the ruins of the building. The materials that had been used in making the alterations were of good quality, but altogether too light. The cause of the collapse was the giving way of the supports on which one of the iron columns rested. The column rested upon an ordinary brick wall in the cellar, which was altogether inadequate.—Similar evidence was given by Mr. John Holden, architect. The jury returned a verdict of manslaughter against both Reavy and Mooney, the one for employing an incompetent person to make important structural alterations, and the other for undertaking duties he was not competent to perform.

A perusal of the above shows that a *plumber* undertook, and was engaged to act in the capacity as architect, to superintend some important structural alterations, which has resulted in the fall of the building and a lamentable loss of life. Comment is needless.—I am, &c.,

EDGAR FARMAN.

39, King-street, Cheapside, E.C., July 1.

HOME OFFICE, WHITEHALL.

SIR,—The balustrade finishing this building terminates at the angles facing Whitehall. Judging from the construction of roofing at these points, the original intention was to have the angles higher than the main building. I hope Her Majesty's Commissioners of Works will have this put right when the improvements in the neighbourhood are carried out.—I am, &c.,

CHARLES F. MOXON.

PUBLIC WORKS.

SIR,—The mean, cheeseparing economy exercised in respect of our public buildings is fatal to the interests of architecture, the which should fittingly display the nation's wealth and importance. Money is freely spent on everything but architecture! Note the cutting down of the designs for the Law Courts, Scott's Foreign Office left unfinished, the disinclination to complete the possession of the Admiralty site, and still more recently the additions to the National Gallery and the decision in respect of the Institute competition. As regards the Gallery, the new staircase and entrance are done in a pinched and mean manner. There ought to have been a large entrance hall, required in every public building; but here, like a common dwelling, you enter and find yourself on the stairs at once. The entrance hall should have been carried up the two floors and been finished with a dome, the outer dome or covering being made a feature outside in place of Wilkins's petty affair. If I mistake not, this was portion of Mr. Barry's design, and part of the design having been executed, it should have been further adhered to. Now, the possibility of getting a fine building by degrees is rendered impossible. Of course, it may be said that such would have been costly, and interfered with this and that; but great works, whether material or moral, cannot be done without sacrifice. The new work is a botch. Though superior to Wilkins's, it is inferior in quality to Barry's.

As regards the "Institute" building, the Dublin design, double in dignity to any of the others, was generally approved of, the purposes of the building needing a grand and monumental display. It has unhappily been set aside for something cheaper, but much less stately. This is a great pity. Modification, where needed, might just as well have been applied to the first design as to the second, and any difference of cost would have been worth the money. The chosen design, in spite of its Dutch dress, reminds one too much of the neighbouring Natural History Museum, and the genuine strength of Waterhouse becomes a milk-and-water house in the to-be building. Certainly, the animals flanking the dormer windows of Institute should be omitted. However appropriate to the Museum, the copyism is too utterly utter, and the zoology out of place at the Institute.

Two notable things in respect of the Institute are worth recording: though the press have deferentially abstained from adverse criticism, yet the British public think the thing a mistake, and doesn't give its money freely, and that the support comes chiefly from India. If this latter is a voluntary and free-will offering, it is interesting.—I am, &c.

M.

WORKMEN'S COTTAGES.

SIR,—In your last issue I notice that one of your correspondents makes a statement to the effect that a wash-house is not necessary in a workman's dwelling, except it is used by two or more tenants, and that the pump shown in my design is in an angle. I might state that my plan shows the wash-house common to two houses, and is not divided into two, as Mr. Thorneloe evidently thinks, and that the pump stands with its back only against the wall.—I am, &c.,

AUTHOR OF 1ST DESIGN (LOIDIS).

AN EXPLANATION WANTED.

SIR,—Can any of your numerous readers explain this? At an empty house, where

repairs are being done, there are three or four workmen. On entering the place, all is quiet as a church, but as soon as I am seen, or my footfall heard, there arises a deafening clattering of hammers, banging of boards, shouting out "Hillo Jim," &c., that I can scarcely hear in the place. If this had occurred once only, I should not have noticed it; but it is so frequently the case as to be quite observable. Will some reader kindly explain it? If a British workman will do so, I should value it more than from a professional.—I am, &c.,

M. P.

THE NUISANCE FROM SEWER VENTILATORS.

SIR,—Another instance of the utter uselessness of stack-pipes as a means of ventilation to sewers came under my notice yesterday, which may interest your readers.

At Tottenham, many of the sewer ventilators being a nuisance, the Board, instead of putting up shafts, decided to make other alterations to abate the evil, and on taking up an offensive grating opposite Green Lanes Station, Wood Green, found that a 6in. ventilating pipe was already attached, running under the road some 30ft., and carried up the house adjoining, the outlet being half-way up the chimney. According to theory, a current of air should be going up this pipe to relieve the sewer; but, in fact, the air was almost stagnant, giving the appearance of a pipe choked. On testing, this pipe was found clear; but the portion running under the ground contained sewer-gas heavier and of a lower temperature than that of the grating or atmosphere of the street. This acted like a plug, choking the pipe, and preventing any ventilation taking place, except through the grating. After rarefying this heavy gas in the inlet pipe, the smoke ascended the pipe similar to that of an ordinary chimney. Is it not natural that sewer ventilation should prove a nuisance during hot weather when, by the action of sewer-gas passing through these cold pipes, an effectual stoppage of ventilation takes place, and that at a time when good ventilation is most needed? In cold weather, when the air in pipes underground is warmer than that of street, an uncertain current is set up; but in summer it is quite the reverse.—I am, &c.,

R. H. REEVES.

Cedardale, Putney, June 30.

IMPERIAL INSTITUTE.

SIR,—I am glad to find that a dome is recommended instead of the high tower, which I do not pretend to criticise, but venture to express an opinion that in this otherwise beautiful structure or design a rare opportunity occurs for crowning it with that most noble feature, a fair proportioned dome, especially as the building is likely to be increased, and so be even more desirable to have a bold spreading central object—e.g., there is nothing in all London of more striking effect than the dome of St. Paul's. The great Victoria Tower will not compare with it for grandeur.

Probably the architects who have only shown small domes in their designs may have considered them as large ones, or as much greater works than they need be; but now we have such excellent materials as good Portland cement, terra-cotta, &c., it becomes with appliances more easily attainable than for such a construction as at St. Paul's. The conical kiln-like internal structure shown in Messrs. Deane's design is not necessary, nor any timber, as all could be constructed to endure till an earthquake opens *terra firma* beneath; such is the opinion of—

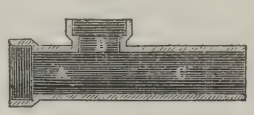
Yours, &c., JAS. PULHAM.

P.S.—The late Sir Gilbert Scott wrote that he longed for the opportunity of introducing a great dome.

DRAINAGE AND SANITARY FITTINGS.

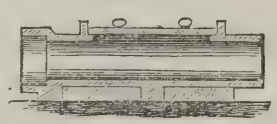
SIR,—The long letter from Mr. Bruce on pp. 982 and 983 of June 24th issue is full of mistakes and fanciful or manufactured assumptions, and as these, unless corrected and pointed out, might mislead some of the readers of this journal, I respectfully beg leave to expose them, more especially as the "desperate effort" he has made to attack me shows how the want of discrimination in a person will make him as blind mentally as defective eyesight does in disabling some people from distinguishing between the colours of a green gooseberry and a red rose.

Mr. Bruce asserts—"There is not the slightest reference to a stilted machine in Spencer's patent of 1848." Now, this patent, No. 12,115, is for "Machinery," and he claims "the method of forming or making 'stilts and feet,' and burning the tubes or pipes thereon." So that the stilts were part of the machine or apparatus used in firing the pipes.



I am much obliged to Mr. Bruce for the diagrams 1 to 4 on p. 982. No. 3, showing my 1879 style of "feet," is no more like Francis and Waters's 1810 (Fig. 1) style than is the green gooseberry like the red rose. F. and W.'s "feet" are in reality *collars* in two halves encircling the junctions of the pipes, the pipes being stuck *end to end*, with a half collar below the joint and another half on top. If Mr. Bruce thinks highly of this antiquated plan he is quite welcome to prefer it to my style, only he should not, with the slightest respect for the truth, say the one style is similar to the other.

The pipes illustrated in Stiff's "Provisional Protection" only, No. 3,028, Dec. 7th, 1857, are in two halves, with serrated edges at the junctions; and his "standards" consist in simply making the bottom of the pipe about ½in. thicker than the top, and making the bottom broad and flat. There is not the slightest resemblance here, either to my style of feet, which *raise up* the pipe about 2in. or so, and, *inter alia*, allow the hand of the workman to get round below the joint.



For his own ends, Mr. Bruce would like to be able to prove that the access openings in

Shoebridge's 1853 Round Opening.

Buchan's 1877 and Bruce's 1885 Round Opening or Eye "B."

Buchan's 1879 Longitudinal Opening.

the pipes referred to in Shoebridge's Provisional No. 1,335 of A.D. 1853 were not simply round holes or "openings" with lids (said openings being no larger—whatever smaller—than the diameter of inside of pipe), but longitudinal openings, longer than the diameter of the pipe, and says that I fail to explain how Shoebridge got at the interior of the drain with facility to remove impediments through "round" openings. Now, in regard to this, I beg to observe that as yet I have no reason to suppose that Shoebridge in 1853 was any cleverer than Buchan in 1877, or Bruce in 1885, and *both* of these latter in their patents then only show *round* openings, same size as the interior diameter of the drain-pipe for "access," "cleansing," and "inspection."

In 1879, I wished to get my head into these access openings to view the interior of the pipe; but finding I could not do so with the 6in. openings or "eyes" in the 6in. pipes, I then conceived the idea of having *longitudinal* openings, which I patented, and I have not seen or heard of any evidence that such openings as those in my 1879 patent were ever made in drain-pipes before those made for me by Messrs. J. and M. Craig, of Kilmarnock, after 24th December, 1879. I defy Mr. Bruce to produce any substantial proof that such were made before then. The long openings are more difficult to make than the round ones.

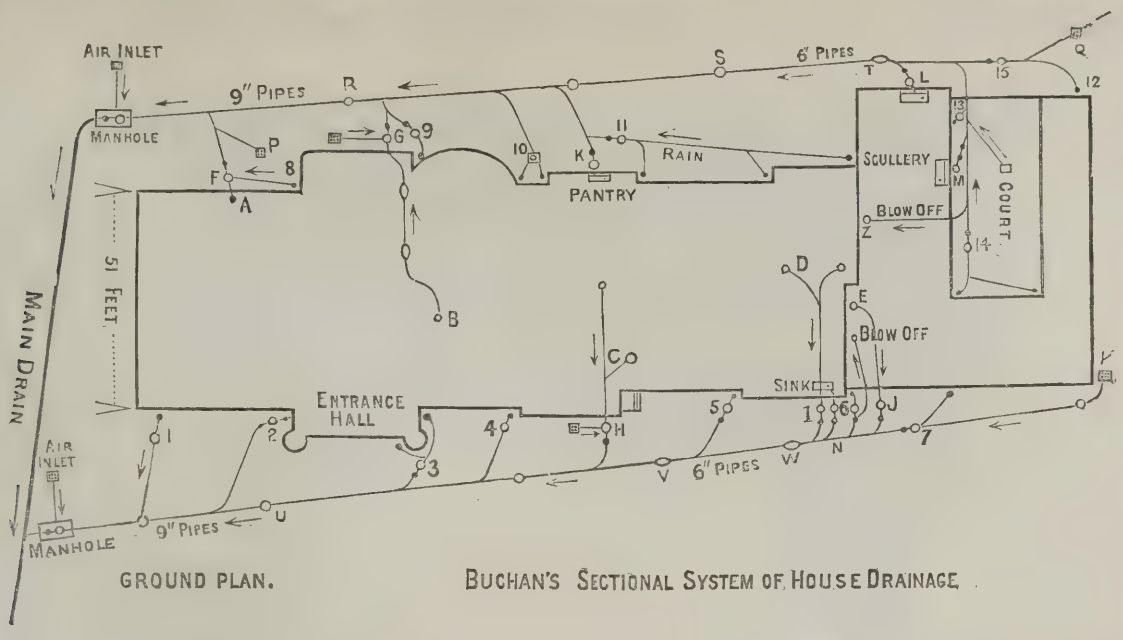
I here give a sketch of Shoebridge's probable access opening with lid, also of the round eye-pipe style, and of my new 1879 style. It would be interesting to know if it was want of money or the introduction of the eye-pipe that prevented Shoebridge in 1853 from proceeding with and illustrating properly what he intended to patent.

Mr. Buchan did *not* say a double system of drainage was of no use "under any circumstances," but that it was a useless expense, unless it was to serve some useful end. If Mr. Bruce really saw traps with extra branches for side connection for air as well as for water before 1885, why in that year did he attempt to patent such as a new idea? If he will read Buchan's 1878 and 1883 patents and look at the drawings, he will see that these extra branches may be made either in one piece with the trap or in two pieces, and I showed the branches at various angles long before Mr. Bruce in 1885 patented the particular angle of "twenty-five degrees," which I consider the greatest nonsense imaginable, because it limits the distance between the air grating and the trap to about 3ft. or 4ft., whereas sometimes the distance desired is 30ft., and perhaps, as I have at Stracathes House, round a corner, so that of the two styles illustrated on page 898, Mr. Bruce's is anything but an "improvement" on Buchan's prior style.

As to Mr. Bruce's assertion that the right angles in my air passages "are very objectionable," that only shows his ignorance of the subject. To have a rounded turn next the water is a mistake, as tending to conduct the cold air down upon the water in the trap.

Figs. 5 and 7 in Mr. Bruce's patent specification, No. 7,579, A.D. 1885, price 8d., are therefore, in my opinion, faulty in this respect. He shows in same figures the top turn of the traps next the house as rounded, which is all right; but, then, that is the style shown and made by me long before 1885. As to Mr. Bruce's funnel-shaped side fresh-air inlet, shown on pages 733 and 898, I consider it nonsensical, and its slope down into the trap bad. The wind passing over an enlarged mouthpiece such as Mr. Bruce shows tends to draw out the air from the drain, so that for this and other reasons the fresh-air inlet to a drain or soil-pipe should not be larger, but smaller—generally much smaller—than the drain or soil-pipe. Dr. Wallace, Past-President of the Philosophical Society of Glasgow, agrees with me as to this, and considers the idea of enlarging the fresh-air inlet "ridiculous."

Mr. Bruce says his trap "is not with a hollow ogee to retain and show soil," &c. Now, he should know what he made this for; but there is no use in saying the hollow and ogee are not in the trap, for they can be seen in his 1885 trap on page 733, or more clearly still in his 1885 specification, Figs. 1 and 3, while the text speaks of "the upturned, curved breast." Now, in the name of commonsense, what is the use of an "upturn" at the turn-over edge of a water-trap? My traps, long before 1885, were shown with sharp, square, or angled edge. What improvement results from making a hollow behind the sharp edge? Is this hollow the mere modification styled an improvement? And is this the "construction" boasted about as making the trap "self-cleansing"? Mr. Bruce says the breast of his trap is straight across at the turn-over. Mine have sometimes been so made long before 1885; but I did not consider that any improvement. I thought, and think still, the bottom of a drain should be round, not flat.



Notwithstanding the various attempts made by other people to improve upon my No. 2 trap, no other person has as yet managed to do so. Various parties have attempted to copy it, and advertised in BUILDING NEWS, &c., *four paid penalties for doing so.* If I find the manufacturers of Bruce's traps are selling traps like mine without proper permission, they may shortly hear from my lawyers on the subject. It is sometimes dangerous for a manufacturer to make certain things, even for the patentee of such, if there is a prior extant patent infringed upon. And I may here ask if it is not the case that the patent agent who took out the provisional protection of Mr. Bruce's 1885 patent cautioned him as to copying Buchan's prior patents rather closely?

Mr. Bruce states at foot of page 982 that I admitted that stinking air accumulated in connection with a Buchan's trap, and sometimes came out at the surface grating, and he then goes on to say that *his* so-called self-cleansing

GROUND PLAN. BUCHAN'S SECTIONAL SYSTEM OF HOUSE DRAINAGE.

trap would cure this. Now, he was simply writing what is not true. I did not say that the air that sometimes puffed out at the inlet grating was from the trap, but from the drain or soil-pipe discharging into it. So no real or pretended self-cleansing trap will cure that, hence my 1878 side fresh-air inlet shown on page 898 was invented by me to do so, and which plan Mr. Bruce's "25 degrees" inclination idea is, in my opinion, an inferior modification of. Mr. Bruce seems to claim as a novelty a fall of 2½in. into his 1885 trap. In 1875 I spoke of the fall being "about 2in." or "several inches." He seems to claim as another novelty a water seal of 2 to 4in. The water seal in my traps has ranged from 1 to 5in., according to circumstances. An ordinary drop and water seal in my 6in. traps is 2½in. of each, and I was not aware a real or supposed quarter of an inch of difference of seal or lock would leave room for a new *patent!*

Mr. Bruce attacks the practice of putting up water-closet soil-pipes outside, but how about the Local Government Board Bylaws in England being broken, which say the soil-pipe must be fixed "outside such building," if Mr. Bruce's notions were put in practice? Then, if the L. G. Board Bylaws order the soil-pipe to be outside for safety, and the water-closet to be next an outer wall, it would hardly be consistent to allow Mr. Bruce to put up his soil-pipe or drain ventilating pipe in the inside of a wall *in the middle of the house.*

Mr. Bruce may say what he likes about his plan on page 857 being proof against siphonage, but I do not believe him. The plan is faulty and risky, while leaving, as he confesses, 1ft. 3in. of the top of the soil-pipe unventilated, is *not* a good and safe job.

Buchan's 1883 Plan of the Air going with the Water.

Mr. Bruce writes as if soil-pipes were not often put up without showing them off outside, but he should know well enough that there are thousands of soil-pipes fitted up inside the outer wall without anything outside to tell they are there, and they can be so done, and well too, without adopting Mr. Bruce's foolish plan. Should a client request that the fresh air be drawn *down* his soil-pipe, it could be done with both soil-pipe and blow-off pipe inside the wall, but both being carried up to above roof per my 1883 plan here sketched, or a modification of it to suit particular case.

The Fig. 7 style of fitting up a soil-pipe, published in my 1879 patent specification, but not claimed, is not the style I referred to as freezing the trap or soil-pipe, for this style does not draw in the air *down* the soil-pipe from immediately behind the closets, as Mr. Bruce suggested. I made the illustration to show how to carry out practically certain ideas if it were desired to test them. I do not remember carrying out this style for a closet, but have done so for a bedroom wash-basin.

I must now apologise for the space taken up replying to Mr. Bruce's misleading remarks—he reminds me of the Scotch beadle who went into the pulpit to show his minister how to preach—but these having been so many must be my excuse.

Before closing it may be interesting and useful to give this diagram, illustrating how I have lately improved the drainage of Armadale Castle, in the south of Skye, for Lord Macdonald of the Isles.

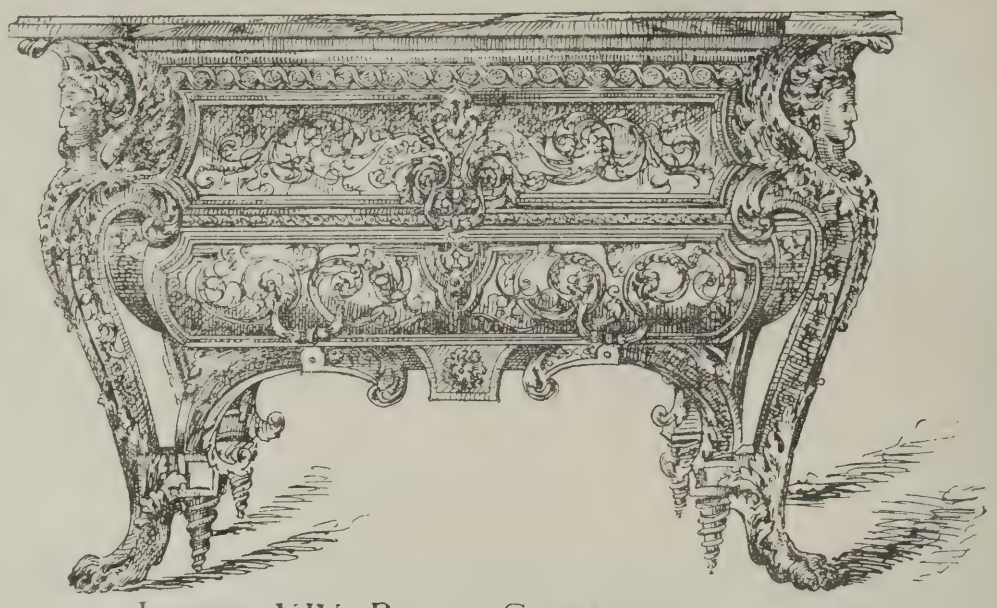
The building is a fine castellated-looking mansion house, about 240ft. long over all and 51ft. wide at the approach end. The "main drain" is a stone-built one. It is carried down towards the sea; it is disconnected by two 9in. No. 2 Buchan's traps with separate manhole for each as shown. The drainage of the front of the house is therefore distinct or locked off from the back. The traps 1 to 7 in front and 9 to 15 at back are for rain pipes; A to E are w.c. soil pipes; F and G at back, and H I J in front, are the Buchan's 6in. No. 2 traps for them with side fresh-air inlets. The scullery sink and other sink in front have a Buchan's grease trap. All the traps and pipes were supplied by Messrs. J. and M. Craig, of Kilmarnock. As will be seen from the style the work is done on the sectional system, so that should any branch drain or soil-pipe leak into the house only the air from that particular branch pipe can get out into the atmosphere of the house. The drain pipes inside the house are concreted round. They have access-pipes for inspection, &c., when wished. These were also used on the outside drain for examining the interior of the pipes while the work was going on. Z is a 4½in. strong iron blow-off pipe, red-leaded inside, for ventilating the back drain. The other blow-off is a 4in. iron pipe for the front drain. Both are carried up the high gable to several feet above the chimney cans, and surmounted by Buchan's I.C. fixed exhaust ventilators. Blow-off ventilating pipes or air-pipes for the soil-pipes are carried up to above the roof. The rock for about 150ft. in front from about U to N had to be blasted with gunpowder to get depth for the traps and pipes. Had the main drain not been at the approach end of the house I might have carried up the blow-off pipes from the manholes.—I am, &c.,

W. P. BUCHAN.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

SURREY ARCHÆOLOGICAL SOCIETY. — The annual excursion of this society took place on Tuesday in the Metropolis. The members assembled at the church of St. Saviour (St. Mary Overie), London Bridge, where a paper on the history and architecture of the church was read by Mr. F. T. Dollman. They afterwards went, accompanied by the president, Viscount Midleton, to Lambeth Palace, where Mr. S. W. Kershaw, F.S.A., described the library and furniture, and Mr. J. P. Seddon the chapel. St. Mary's parish church, Lambeth, adjoining the palace, was subsequently visited; and in the evening the members dined together at the Holborn Restaurant.

CHIPS.



The marriage of Miss Beatrice Brabazon Urmston, third daughter of Colonel and Mrs. B. Brabazon Urmston, of Ardenlee, Maidstone, and Mr. Wm. Howard Seth-Smith, V.P.S.A., eldest son of the late Mr. William Seth-Smith, of Tangley, near Guildford, took place on Thursday afternoon, the 30th ult., at Holy Trinity Church, Maidstone, in the presence of a very large congregation. The Rev. E. J. Selwyn, rector of Pluckley, and the Rev. Robert Bruce, D.D. (uncles of the bride), assisted by the Rev. A. E. Coote, curate of Holy Trinity, officiated. On Friday afternoon Colonel and Mrs. Urmston gave an "At Home," when upwards of 100 local friends were present. The wedding presents were on view, and the town band played a choice selection of music in the garden. On Saturday afternoon upwards of 120 poor people of Holy Trinity parish were entertained to a substantial tea in the garden at Ardenlee, in honour of the event. The wedding presents exceeded 160 in number.

At a meeting of the Matlock local board held on Monday, the salary of their surveyor, Mr. T. Holtom Allen, was raised from £85 to £100 per annum, and Dr. Moxon was appointed medical officer of health.

A new highway bridge at Hundred House, Radnorshire, has just been completed, from designs and under the superintendence of Mr. Stephen W. Williams, of Rhayader, the county surveyor. Mr. Alfred Meredith was the contractor for masonry, and the Horsehay Co. for ironwork.

At a meeting of the Stratford-on-Avon Town Council yesterday, the Mayor, Sir Arthur Hodgson, announced that Lord Ronald Gower had offered to present to the town a Shakesperian monument, designed by his lordship, a plaster cast of which is a well-known feature of the eastern portion of the great transept in the Crystal Palace. The monument consists of life-size figures of Shakespeare's principal characters, with the poet himself in the centre of the group. The council has gladly accepted the gift.

Considerable improvements have been recently made to the fronts of Aston Hall by order of the Museum and School of Art Committee of the Birmingham Corporation. The glass pavilion on the west front has been removed, and the terrace occupying its place has been arranged and planted under the superintendence of Mr. Jethro A. Cossins, architect, of Birmingham.

NEW BOARD SCHOOLS, GOODRICH-ROAD, DULWICH, AND WOODLAND-ROAD, NORWOOD.—CLAINES CHURCH, WORCESTER.—ENTRANCE HALL, BELLE VUE, DOUBLE BAY, AUSTRALIA.— HIGHLAND GARDENS, ST. LEONARDS ON-SEA.

OUR LITHOGRAPHIC ILLUSTRATIONS.

GOODRICH-ROAD BOARD SCHOOL, DULWICH.—WOODLAND-ROAD BOARD SCHOOL, UPPER NORWOOD.

THESE schools have been erected by the School Board for London from the designs of their architect, Mr. Thos. J. Bailey. The amount of contract for the former was £17,170. It contains accommodation for 1,594 children, and the area of the site is 70,280 square feet. The latter school was erected at a cost of £9,879. It contains accommodation for 807 children, and the area of the site is 26,135 square feet.

ST. JOHN THE BAPTIST, CLAINES, WORCESTER.

THIS church had long been in an unsatisfactory condition. The interior was crowded with galleries, which cut across the windows and darkened the church, while the chancel, in addition to the rest of the building, was blocked up by high pews; these, and the galleries have been removed, and in order to provide the necessary accommodation a new north aisle has been added, while a vestry replaces a poorly-built brick one of some 80 years ago. This new aisle and vestry are shown in the exterior view, the aisle windows being the old ones rebuilt into the new wall. The oak roofs, where decayed, have been replaced in oak, the whole of the seating and other fittings throughout being in oak also. The floor of the chancel has a "Jesse tree" designed in mosaic by the architect. The chancel has been restored by Sir Offley Wakeman, Bart., and the remainder of the church by the parishioners. The church has a few interesting monuments, the best of which is an altar tomb to John Porter, 17th century; this had been removed and fixed against an outside wall of the church, with the effigy on its side, but has now been replaced in the chancel; no monuments or slabs have been removed. The drawings from which our illustrations are taken are by Mr. F. G. Knight, and are in this year's Royal Academy exhibition.

ENTRANCE HALL, BELLE VUE, DOUBLE BAY, NEW SOUTH WALES.

THIS house is now nearing completion, and the furniture and fittings for the building are almost finished. The drawing-room, dining-room, library, and morning room, as well as the smoking-room, are treated somewhat differently the one from the other, it being desired to obtain a variety of design adapted to their several uses; but the woodwork and general character of the house agree with the style adopted for the central hall now illustrated. The hooded fireplace was, like other particular features, specially wished for. The chimney-piece is in rich dark mahogany, carved in the solid, and detailed from clay models made from the architect's full-size drawings by Messrs. Hollands. The panelled dado is in cedar wood. The fireplace itself is in red marble, harmonising with the mahogany. The staircase window, in white and canary painted glass, has swags with ruby and green colourings, and Holbeinesque panels representing "Hospitality" and "Friendship," with figure subjects below illustrating "Welcome the Coming and Speed Well the Parting Guest." The metal casements used in all the windows of the main building, containing ornamental quarry lead glazing, were made by Messrs. Burt and Potts, of Westminster. The mosaic paving was carried out by Messrs. Burke and Co. The wall and paving tiles were made by Messrs. Godwin and Sons, of Lugwardine, and the tiles used for the roofs were supplied by Messrs. Burton and Sons, of Broseley, Staffs. The house is of red brick with stone dressings to the main windows, treated in a rendering of the English Renaissance work peculiar to James I.'s reign. The porch is made a feature on the entrance front, and verandahs run round the building for the purpose of shading the reception rooms from excessive light and sun heat. Mr. Maurice B. Adams, F.R.I.B.A., of London, is the architect of the work thus described, Mr. H. C. Kent, of Sydney, being the resident architect. The drawing from which our illustration was taken is now on view at the Royal Albert Hall, Kensington.

HIGHLAND GARDENS, ST. LEONARD'S-ON-SEA.

OUR illustrations of to-day are from drawings now on exhibition at the Academy, and represent a block of houses recently erected on the Highlands Estate, St. Leonard's-on-Sea, the property of Mr. Vandeleur B. Crake, J.P., a favourite residential position adjacent to the Maze-hill, commanding extensive marine and land views. The aim of the design has been to secure utility in plan, combining picturesque treatment of a character pleasantly contrasting with the dreary stucco residences unfortunately so common at this and other watering-places. The houses are built in local red brick of good colour; the road frontage is emphasised with carved and cut brickwork and wrought-iron inclosure; while the south, or garden, front is broken up with projecting bay windows boldly treated in carved wood and enriched hand-worked plaster, the upper portions having additional relief in tile, the high-pitched roof with dormers and chimneys adding an effective skyline. In the interior the detail has received equal consideration. The reception-rooms, with their deeply-projecting bays, specially designed carved wood chimneypieces, purpose-made stoves, and hand-painted tiles, are pleasing features; whilst throughout the general finishing of the houses are of a corresponding character. The sanitary arrangements are in every respect on the latest improved principle. The works have been undertaken and carried out in an excellent manner by Mr. Fred Cruttenden from designs and under the direction of the architect, Mr. Philip H. Tree, A.R.I.B.A., St. Leonard's-on-Sea.

THE IMPERIAL INSTITUTE.

WE postpone the illustrations of the remaining five designs till next week, when we shall give them altogether.

Few places on the North-East coast have within the last few years made greater progress than Whitley, near Tynemouth. At one time a picturesque hamlet, with a handful of inhabitants, later "a village of pleasing rural appearance, containing some costly houses," it has now assumed the proportions of a town. The largest landowner is Mr. J. T. Davison, and part of his estate is now being laid out for building purposes, from plans prepared by Mr. Henry Gibson, architect, North Shields. Care has been taken to classify the property, and to maintain a uniformity of design throughout. Davison-road, which leads from near Whitley Station direct to the coast, consists of a class of large houses, built by Mr. R. H. Nesbit. A terrace of houses will extend from Davison-road to the East Parade, fronting on to what will be known as the Marine-drive, extending from Cullercoats to Blyth—a distance of nearly eight miles. There will be large garden ground in front of the terrace, and room will be provided for coach-houses, stabling, &c.

The contract for the restoration of Upper Helmsley Church has been let to Messrs. Schofield and Abbey, of Claxton, near York, and the plans have been prepared by Messrs. Lewis and Son, of York.

SKETCHES OF DECORATIVE OBJECTS.

OUR illustration to-day is rather an interesting one, as most of the subjects have been in celebrated sales and exhibitions. The sarcophagus-shaped Commode, is of the Louis XIV. period, of black buhl, has beautifully modelled terminal figures at the angles in relief, and on the top a slab of Verona marble. The Limoges enamel Ewer is a beautiful example of a process the art of which is now lost, and consequently every piece of such work fetches a fabulous price. This was originally in the Hamilton Palace collection, and was exhibited at South Kensington in 1862; it has an oval flattened body, painted in grisaille on a black ground; on the upper part are marine deities, and on the lower centaurs and tritons fighting for women. The Tazza of Henri Deux ware has a shallow hemispherical bowl, supported on a massive stem. The exterior is covered with inlaid ornaments of the richest and most elaborate character in red tint. A small medallion in the centre contains the usual device of Henri Deux—viz., three interlaced crescents. This is one of the very few pieces of that celebrated ware in existence. The ivory pedestal is very finely carved, with a Bacchanalian dance, by Fiammingo, and has a capital and base of chased ormolu; this was also exhibited at South Kensington, and was in the Hamilton Palace collection.

COMPETITIONS.

MAIDSTONE.—The Maidstone Borough Lunatic Asylum competition has during the past few days been settled in favour of Mr. Edward William Stephens, architect, of Maidstone. Mr. H. Saxon Snell, F.R.I.B.A., acted as referee, and the following are the terms of his award:—"The conclusion I have arrived at, from a very careful scrutiny of the details of the various plans, is" (there were 42 designs) "that No. 31 would make the most perfect building, and that it is capable of being much lessened in cost by the reduction of some superfluous accommodation." A correspondent writes, respecting this contest: "There were no premiums, and so the magistrates have got nearly a thousand pounds' worth of work out of the profession for very small expenditure on their part. A guinea was charged for the plan of the ground and the levels supplied to each of the competitors. A semi-public exhibition of the designs is reported to have taken place, and the plans have been returned to their authors 'carriage paid.'"

GATESHEAD-ON-TYNE.—A meeting of the Gateshead School Board Plan Committee was held on Monday afternoon to consider the plans sent in for the erection of a Board school at Teams. Thirteen sets of plans had been sent in. After an exhaustive examination, it was agreed to recommend the three following plans, placed in order of merit, for the members to decide upon at their next meeting, and bearing the following mottoes:—"Derwenter" first, "Evolution" second, and "L'Ecole" third.

Brunswick Park, Wednesbury, which has just been completed at a cost of about £6,000, from the designs of Messrs. William Barron and Son, Elvaston Nurseries, Borrowash, Derby, has just been formally opened by the Mayor of Wednesbury (Alderman Williams). Messrs. Barron and Son were assisted in their design of the lodge by Mr. W. H. Radford, of Nottingham. The park is about 25 acres in extent, and is finely undulated. A commanding mound 50ft. in height, which was formerly a most unsightly pit-hill, has been very effectually treated. Two lakes have been constructed, and a cricket ground, tennis lawn, bowling greens, band stands, shelters, &c., provided.

Mr. William Hall, of Bilston, has generously presented the town with 22 acres of ground within ten minutes' walk of the Bilston town hall, as a Jubilee gift for a public park. It was decided to offer two prizes of 20 and 10 guineas for the best design for laying out the same. The first prize has been awarded to Messrs. William Barron and Son, Elvaston Nurseries, Borrowash, Derby, and the second to Mr. W. Milner, Crystal Palace School of Landscape Gardening, Sydenham.

The guardians of Holborn Union have adopted plans prepared by Mr. H. Saxon Snell, their architect, for providing additional buildings giving accommodation for imbeciles and lunatics at the City-road Workhouse, the estimated cost being from £6,000 to £,7000.

Engineering Notes.

ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.—The annual meeting will be held in Leicester on Thursday, Friday, and Saturday, in next week. The members will assemble at eleven o'clock on Thursday, the 14th inst., in the Council Chamber of the Town Hall, Leicester, when, after a reception by the Mayor, the annual report will be submitted, and the election of officers for the ensuing year will take place. One of the proposals to be discussed is a very sensible suggestion by Mr. Meade, that the present unwieldy title be cut down to "The Association of Engineers." After the delivery of the president's address by Mr. J. Gordon, borough surveyor of Leicester, the following papers will be read and discussed :—"Concrete Cement and Asphalte Footways," by Mr. G. R. Strachan, A.Inst.C.E., and "Refuse Destructors and their Results up to the Present Time," by C. Jones, A.Inst.C.E., of Edinburgh. At 2.30, members will visit the following places of interest and works in the town, manufacturers representing various industries having thrown their establishments open to inspection :—The old Town Hall, the Roman Pavement, the Public Baths, Bath-lane; the Co-operative Society's Boot and Shoe Manufactory, Dun's-lane ; Mr. Fielding Johnson's Spinning Factory, East Bond-street ; Mr. Jessop's Crane Works, Canning-place ; and Mr. Raven's Hosiery Factory, Wheat-street, Wharf-street. The annual dinner will take place at the Masonic Hall, Halford-street, at 6.30. On Friday, the 15th, members will meet in the Council Chamber at 10 a.m., for reading and discussion of the following papers :—"An Examination of the Experiments of W. F. Dibdin, F.C.S., F.I.C., for the Metropolitan Board of Works on Sewage Treatment," by R. W. Peregrine Birch, M.I.C.E., F.G.S. ; "Crematories," by W. Eassie, C.E. ; and "Jennings's and Brewer's Automatic Sewage and Water Gauge," by W. Jennings. At 1 p.m., members will visit various works recently executed and in progress in the borough, including the New Weir and Flood Basins, Freemen's Meadow, Aylestone-road ; New Gas Tanks (now in progress) and Chemical Works (recently completed), Aylestone-road Gasworks, under Mr. Colson, gas-engineer and manager ; New Building Estate, Spinney-hill ; Spinney-hill Park ; Sewerage Works, Belgrave-road ; Abbey Park ; Open Air Swimming-bath at St. Margaret's Pasture ; and Flood Works from North Lock to Braunstone-gate, and at 6.30 are invited to a garden fête at Ashleigh, Knighton, the residence of the Mayor. On Saturday, the 16th, members will assemble at the Town Hall, and leave in brakes at 9 o'clock for the Victoria Stone Company's Works at Groby, where Mr. Griffiths, the lessee, will receive them. Having next seen Bradgate reservoir and pumping station by way of Bradgate Park and Ruins, they will also inspect the well-known Mount Sorrel Granite Quarries, where the members will be received by Mr. R. F. Martin, who will conduct them over the quarries and works. In the afternoon the visitors will proceed by special train, provided by the Mount Sorrel Company, along the company's private line to the new cement works and the Barrow Hydraulic Lime Works of Messrs. John Ellis and Sons, where the members will be received by Mr. W. H. Ellis and other members of the firm. The party will return to Leicester by way of Rothley and Rothley Temple (the birthplace of Lord Macaulay), Thurcaston, and Mowmacre Hill ; Leicester Abbey (where Cardinal Wolsey died), and the Abbey Park.

THE PROPOSED THAMES TUNNEL AT BLACKWALL.—The Bill promoted by the Metropolitan Board of Works for powers to construct a tunnel under the river Thames between Blackwall and Greenwich Marshes came on on Thursday in last week before a select committee of the House of Lords. No opposition being practically offered to the scheme, the committee passed the preamble and proceeded to go through the clauses of the Bill, upon which the London and North-Western Railway appeared in the interest of some property held by them near the entrance to the Poplar Docks. The proposed tunnel, which has now received the sanction of both Houses, will, it is estimated, cost just over £1,500,000, and will be constructed on the pneumatic shield principle, so as to avoid interference with the bed of the river, and to prevent any danger from subsidence of the soil. The total length of the tunnel, including the approach roads, will be 10,853ft., or a little over two miles.

ARCHÆOLOGICAL.

THE BRITISH SCHOOL OF ARCHÆOLOGY AT ATHENS.—The Earl of Carnarvon presided over the first annual meeting of the subscribers to this school, held on Wednesday in the rooms of the Society of Antiquaries, Burlington House. There were present, among other ladies and gentlemen, Sir C. T. Newton, Professor Jebb, Lord Lingen, the Earl of Morley, the Rev. Charles Evans, Sir F. Pollock, Dr. E. A. Bond, Mr. G. Godwin, Mr. Watkiss Lloyd, Professsor Percy Gardner, and Mr. Walter Leaf. The secretary, Mr. George A. Macmillan, read the annual report, which stated that Mr. F. C. Penrose, the director, had, besides directing the work of the students and delivering public lectures on historic sites, conducted excavations on the site of the Temple of Olympian Zeus at Athens, which established the important fact that the temple was octastyle, not decastyle, as had hitherto been supposed. As Mr. Penrose's successor, the committee had secured for two years the services of Mr. Ernest Gardner, the first student enrolled in the school. Lord Carnarvon, in moving the adoption of the report, said that the undertaking had been fairly launched. One thing only seemed to be wanted, and that was money. It came in very slowly, and that, when he looked at the nature of the work, and the probable results, he marvelled there should not be found men throughout the length and breadth of this country who possessed great private and personal means, who were willing to benefit themselves by this remarkable movement, and become associated with the British School at Athens. The report having been adopted, Mr. Penrose gave an account of his work during the past year. He had been able to visit and collect objects of art from Palermo, Oropus, Sicyon, and other places, and in his labours the American and German archæologists had afforded him much valuable help. He had, unfortunately, contracted a fever ; but had been able to give lectures on the Parthenon, the Erechtheum, and other subjects. The students had been doing good work, and had achieved valuable results. Lord Carnarvon moved a vote of thanks, which was heartily given, to Mr. Penrose for the great services which he had rendered the school.

An addition has just been made to the museum of the public library at South Shields. It is the bust, in white marble, of the late William Wouldhave, of South Shields, the reputed inventor of the lifeboat. The bust is the work of the late Mr. Rowe, a South Shields sculptor, and was executed about thirty years ago, from descriptions given by persons who knew the ingenious boatbuilder, and who declared it to be a capital likeness. So far as is known, there is no portrait of Wouldhave in existence. Wouldhave died September 28th, 1821, and was interred in St. Hilda's Churchyard, South Shields, where the tombstone containing the model of a lifeboat is a conspicuous object.

By the new branch railway of the Midland Company up the valley of the Wharfe past Bolton Abbey to Skipton, now nearly completed, some of the most beautiful scenery in Yorkshire is opened up to the tourist and architectural student. Heretofore a journey to the Valley of the Strid, or to the Abbey, whose situation is hardly less picturesque, has had to be performed on foot, or expensively in a carriage. The new railway will provide travelling accommodation much wanted. It is expected that villa-building will proceed apace in the upper part of the valley, as it has done at Ilkley, Ben Rhydding, and Otley.

On Wednesday week the foundation-stone was laid of a new Constitutional Club in Barden-road, Tonbridge. The plans have been prepared by Mr. Geo. Friend, of Maidstone. The new building, which has a frontage from the road of 50ft., will be of red brick with a tiled roof. The ground floor, beneath which is cellarage, will have an entrance hall, bar, billiard room, reading room, and committee room. On the first floor is a large assembly room, 29ft. by 48ft., which can be divided by a movable partition, and above this is a cloak room and offices. The contract for the work was taken by Mr. C. J. Jones, of Tonbridge, at £1,197.

Intercommunication.

QUESTIONS.

[9337.]—**Half-Timber and Tile-Hung Work.**—Can you put me on to a book in which fairly large plans and sections of this work are given ? I want illustrations of modern buildings rather than old.—DAE.

[9338.]—**Northern Sketching Tour.**—I propose spending a fortnight in the South of Scotland. Starting from Dumfries, I would work east to Berwick-on-Tweed, taking on my way Kelso, Jedburgh, Dryburgh, and Melrose. Then south to Newcastle and Durham, then north-west to Carlisle, and back to Dumfries. Can anyone who has been over this ground give me any suggestions as to places worth visiting en route ? I believe there are one or two good abbeys and castles within reach of Dumfries itself.—H.

[9339.]—**Alterations and Additions.**—I shall esteem it a great favour if any reader will kindly give me his opinion on the following :—At the end of last year a relation of mine commenced some alterations and additions to some buildings, I being very ill at the time. An ordinary estimate was given and accepted verbally, and the work proceeded and payments were made on account weekly. Other small contracts were started in the same way. I then being better, was asked to finish this work for the relation, who is now abroad, and I also undertook other contracts in his name in connection, as none of the former works were completed owing to these other alterations. These payments were all made by cheque in the name of my relation, who is abroad, in the principal contract. I stated to do the work for a certain sum according to plans and specifications, which I produced to the proprietor, and also showed him the quantities, which he copies and pays from same. As work progresses, certain alterations and additions are made and prices given for same, and accepted in writing. Now, in addition to these, other works are ordered—draining and similar matters, also extensions to buildings that have not been agreed for in any way. I now claim for these by a detailed account. I may also say these additions are never mentioned in either plan, specification, nor quantities. The owner now refuses to pay, simply on the ground that it was understood to be done, which we deny. I may also add the owner would not employ an architect. My relation, self, and foreman did plans, &c., and the work, as actually executed, amounts to by reliable valuations £55 more than our full claim, the amount altogether being under £400. An early opinion will greatly oblige.—A 12 YEARS' CONSTANT READER AND SUBSCRIBER.

[9340.]—**Surveyors Institute Examination.**—Will any reader say what other books than the following, which I have, are necessary in the Law subjects for the Valuation section of above—non-students' :—Houldsworth's "Landlord and Tenant," Dixon's "Law of the Farm," Hunt's "Boundaries and Fences," Grady's "Fixtures and Dilapidations," and Innes' "Easements."—SUBSCRIBER.

[9341.]—**Legal.**—I should be much obliged if any of your readers could advise upon the following :—A tenant has taken a house on lease, but before signing the landlord assures her that the materials and workmanship are of the best. Upon taking possession the tenant discovers, and informs the landlord, that the plumber's work is defective, and within a year the cesspool is choked full of waste and surface water, although the road drain might have been used for this purpose ; a hot-water pipe to bath, being pressed against an external 9in. wall, burst from frost, and not being over the zinc tray, the water runs down wall—the bath and pipes being inclosed with framed riser without an inspection door. A sitting-room is so damp that it cannot be used. Who is liable for the cost of repairs—the landlord or the tenant ?—LEASEHOLDER.

REPLIES.

[9310.]—**Half-Timbered Walls.**—If Mr. Thorneloe had carried his historical researches still further back, he would perhaps have discovered another precedent for bad construction, called "wattle and dab," which was at one time practised in this country ; but it has not been met with in recent specifications, and was hardly less barbarous, architecturally speaking, than the method of simulating half-timbered walls, which Mr. Rumble has described. I deny to this last—not with a sneer, but in honest criticism—the name of construction ; it is merely applied decoration, and therefore, scene-making. The origin of half-timbered walling was either ignorance of better materials or the lack of them—either entirely, or in sufficient quantity. In either case, economy was necessary ; and if the better materials were entirely lacking, lattice-work, lime, clay, or even mud had to be used to keep the wind away. The great advantage of half-timbered walls was, that with small quantities of material a warm building was produced; and in this result the external plaster had no little part to play. If there be sufficient brickwork to bolt Mr. Rumble's fanciful garniture to, it ought to be sufficient to keep out the wet without that adjunct ; but in merely filling in to constructed timbers, the thickness attainable is insufficient, hence the necessity of the plastering, of which your correspondent so triumphantly disposes. But Mr. Rumble not only provides a thick wall for the purpose described, but he renders it with Portland cement—on the face of which, by the bye, the battens (*vide* p. 939, last volume) are fixed !—and then proceeds to conceal the whole with a sham. I make Mr. James Thorneloe a present of the privilege of imputing to a person whom he does not know the error of writing upon a subject with which he has not made himself acquainted, and of being practically ignorant of the cost of lead—a privilege the exercise of which may fully demonstrate his audacity, but not his ability, his judgment, or his good taste.—F. B. P.

[9322.]—**Feather-edge Joists.—Correction.**—In my reply printed in the last issue, 5th line from bottom, for "tension," read "torsion."—W. STEVENSON.

[9322.]—**Feather-edged Joists.**—It may interest "W." and Mr. Stevenson to know that I have come across an example of the above in the floor of a warehouse to which I am making additions. The room is 58ft. 9in. long

by 21ft. 9in. wide, and has six 14in. by 7in. beams across, with 7in. feather-edged joists, top edges 2in. wide and bottom ones 4in. These are fixed to 12in. centres; therefore the idea is not entirely new.—J. F. WALSH Halifax.

[9331.]—**Fixing Photos.**—For fixing photographs I use starch tolerably thick, spread thinly and evenly over the photo, not wetting it too much, and taking care to remove all lumps, and then rub down as soon as possible to prevent too much expansion. If the photos are mounted separately, I should think pressing would prevent any bulging if the cardboard is good; but in a book it is almost impossible to get the leaves quite flat. I have been very successful with my own books. The photos are not at all bulged, and the edges of the pages only show a slight wavy line when the book is closed.—A.R.I.B.A.

[9331.]—**Fixing Photos.**—The best "paste" is starch. Weight them heavily afterwards, to avoid cockling.—HARRY HEMS.

[9331.]—**Fixing Photos.**—Pure gum, made very thin and freed by straining from all deposit, will be found an excellent material for fixing photos either in an album or on cardboard. The gum should not be used too freely, but great care should be taken to cover the whole surface of the paper in laying it on. In fixing the pictures, it should be smoothed outwards from the centre with a silk handkerchief. This insures its lying flat.—T. K. C.

[9331.]—**Fixing Photos.**—There are several patent mounting (not "fixing") mediums sold by photographic material dealers, which are suitable for small pictures, though the larger sizes are not easily coated with sufficient uniformity, as the solution dries in parts before the print is ready for pressing. The result of five years' practice as an amateur photographer now recommends the use of the ordinary boiling-water starch prepared in the ordinary way, although it is well known that it is apt to become acid, destroying the print in contact with it; but practically there is no danger if it is of the best quality freshly mixed. It should be evenly spread over the whole of the back of the print, the quantity being sufficient to prevent any part drying before the print is ready for pressing. It may be applied with a small brush, though the best method is to pour out the solution with a spoon and spread it with the fingers, as the sensitive nature of these useful articles is sufficient to detect the presence of the least grain of dust that will show through the print when mounted. The prints should be placed between two damp sheets of blotting-paper before the starch is applied. Press the print firmly with a clean piece of blotting-paper, and roll out all surplus starch by pressing with a round roller of any sort, such as a rolling ruler. The bulging mentioned is caused by unequal distribution of the mounting medium.—WILLIAM GRIFFITHS.

[9333.]—**Ventilation and Prevention of Down-draught in Churches.**—I have had some experience in curing the cause of such complaints as those stated by "Rex," on p. 40, and this experience prevents me from accepting the explanation given by "Rex," and also from joining with him in his wholesale condemnation of the heating as well as the ventilation, especially at this stage. The great complaint is the disagreeable draughts, or down-draughts of air, that are felt. I am inclined to think these come from the ceiling openings "communicating into the false roof only," and before expense is put out upon altering the heating apparatus or anything else, steps should be taken to prevent the air from blowing down from the garret through these ceiling openings. To do this, these ceiling openings (as they are, or as they might have to be altered) should have tubes put in over them to communicate with one or more exhaust ventilators placed above (or under) the ridge, as "Rex" has referred to, and the work so done as that no air from the garret or false roof can blow down into the church. Supposing this done, it sometimes happens with good exhaust ventilators, and often with bad ones, warranted otherwise, that down-draughts take place down through the ventilators and their tubes. To prevent this, I have lately fitted in and supplied for a number of churches, halls, schools, billiard-rooms, &c., self-acting ventilating valve-boxes, which allow free passage to the out-going air, but shut at once against any attempt at down-draught. These were illustrated and described in the BUILDING NEWS of August 6th, 1886. Before anything else is done to the Congregational church "Rex" refers to, the effect of stopping the down-draughts from the ceiling as above referred to should first be tried.—W. P. BUCHAN.

[9333.]—**Ventilation and Prevention of Down-draught in Churches.**—I would urgently recommend him to put himself in correspondence with Mr. John Grundy, 80, Duncan-terrace, City-road, London, who practically undertakes with his warm air ventilating apparatus to overcome all difficulties and disagreeables mentioned by "Rex," and obtain from him some of his pamphlets, containing upwards of 40 pages of testimonials in favour of his system, many of the signatories giving instances and bearing conclusive evidence of having overcome and removed the same complaints where the hot-water system of heating has been adopted in similar constructions. As the same questions have been often asked and the subject often discussed in your pages, it is not necessary to repeat the many objections to the system of hot-water heating as at present introduced; but I venture to say that the down-draughts are caused principally by the hot-water heating, and will continue to exist as long as the hot-water pipes remain.—FRESH AIR.

A meeting of Newcastle-on-Tyne Gas and Water Committee was held recently, at which it was stated that the reservoir which the local water company, under their Act of Parliament, should have completed by July, 1886, at West Hallington had not yet been constructed, and at the present rate of progress it would probably take another two years. The committee decided to take steps to cause the Water Company to complete the project as soon as possible, in order to increase the storage of water for Newcastle and district.

Wembridge Church, Salop, was reopened last week after internal restoration, carried out by Mr. H. W. Pointon, of Wellington.

PARLIAMENTARY NOTES.

THE IMPERIAL INSTITUTE.—In reply to the Earl of Wemyss, Lord Herschell said before committing themselves to the erection of any building, the committee of the Imperial Institute would have a rough model prepared showing the proposed new building and those adjacent, in order to satisfy themselves that there would be that harmony which the noble lord had desired.

THE HOUSES OF PARLIAMENT.—In Committee of Supply on Monday night, on the vote of £37,735 to complete the sum necessary for the building of the Houses of Parliament, Mr. C. Bentinck moved the reduction of the vote, in order to call attention to the position of the statue of Lord John Russall in the central hall, which was out of harmony with its surroundings; but it appeared that the experiment was to be repeated, consent having been obtained for the placing of a second statue in the central hall—viz., that of Lord Iddesleigh. Sir Charles Barry had provided eight pedestals in the members' lobby for the reception of the statues of distinguished Ministers, and it was there Lord Iddesleigh's statue ought to be placed. Dr. Farquharson called attention to the condition of the frescoes in the upper lobby of the House communicating with the committee-rooms. They were in a tattered and dilapidated condition, and the paint was dropping from the walls. Mr. Plunket said the committee which had decided upon the placing of Lord John Russell's statue in the central hall was presided over by Earl Granville, and Mr. Gladstone, the Earl of Beaconsfield, and Mr. Barry were members. The amendment was rejected by 160 to 87 votes. Mr. L. H. Isaacs urged the necessity of the whole sanitary arrangements of the House being under one central authority, and moved the reduction of the vote by £500, with the view of bringing the matter under the notice of the committee. He stated that when the recent committee inquired into the subject they found things in a state of chaos, not being able to obtain even a plan of the drains of the House. Mr. Plunket could not undertake to propose any better system than that which existed, and which he thought was very successful. Mr. Cremer drew attention to the practice of contracting with Messrs. Mowlem, Burt, and Freeman for the employment of workmen about the House, and asked why they were not employed directly by the Government. Mr. Plunket replied that the system of contracting was found to be more economical. The motion for reduction was then withdrawn.

THE CORONATION CHAIR.—Sir T. Esmonde asked the First Commissioner of Works whether it was a fact that the missing portions of the Coronation Chair had been replaced with new work, the new parts painted brown, and the whole varnished with brown varnish; and, if so, whether the old painting and gilding of the chair had been injured, and who was responsible for this restoration. Mr. Plunket: It is true that certain missing portions of the Coronation Chair were, for the purposes of the recent ceremony, of necessity replaced by new work; but this was very carefully arranged, so that they could be again removed without any damage to the chair, and they have been so removed. It is true, also, that a considerable portion of the chair was slightly darkened. On that point I was in error when I last spoke. That, too, was done so as to be easily capable of being undone; and the chair is now, both as to substance and colour, exactly as it was before it was given into my charge. After communications with the Dean of Westminster and the president of the Society of Antiquaries, I am able to state that they are well satisfied with the careful manner in which the monuments and the structure of the Abbey have been treated by the Office of Works. I am bound in justice to say that the whole of the credit is due to the permanent officials of my department, and especially to my surveyor, Mr. Taylor, whose able and unremitting labours I cannot too highly commend.

The following dissolution of partnerships are officially announced:—E. Carritt and S. F. Monier Williams, Great St. Helen's, City, architects and surveyors; Prestidge and Co., Wharf, Grosvenor-road, Pimlico, builders, so far as regards G. Prestidge; and H. and J. Major, Catford, Lewisham, builders and decorators.

Mr. Albert D. Greatorex, Stud. Inst. C. E., assistant, and formerly pupil, of Mr. John Price, C.E., Assoc.M.Inst.C.E., engineer and surveyor to the Toxteth Park Local Board, Liverpool, has been elected to the appointment of assistant district surveyor for the Northern Division of Manchester under the corporation. There were 40 candidates.

Mr. Charles T. Combe, of Edinburgh, has presented the picture of the Royal Volunteer Review of 1860, by Sam Bough, to the National Gallery of Scotland. This important work—72 by 48—was purchased at Messrs. Smith and Co.'s rooms on Saturday by Mr. Combe for 230 guineas.

LEGAL INTELLIGENCE.

A BIRKENHEAD BUILDER SENTENCED TO IMPRISONMENT.—John Pierce, 45, a builder, who resided at the Woodlands, Birkenhead, was brought up for sentence at the Birkenhead Quarter Sessions on Monday. He was found guilty at the January Sessions for having between the months of February and September, 1886, in incurring certain debts and liabilities unlawfully obtained credit under false pretences, to wit, by the presentation of certain bills of exchange, bearing upon them certain false and forged endorsements. Prisoner had induced his sister, wife of John Owen, a grocer at Anglesea, to get her young son to sign her husband's name on a number of bills of exchange, by means of which prisoner afterwards obtained credit. The prisoner was convicted in January last, and an appeal against the relevancy of the indictment was allowed. The appeal had since been dismissed by the Superior Court and conviction confirmed.—Mr. Lloyd, for the defence, urged that prisoner had been in gaol for six months as a reason why he should be dealt with leniently.—The Recorder, addressing the prisoner, said there was no doubt whatever that his case was a very bad one. The offence he had committed was premeditated, worked out elaborately, and carried out regardless of consequences. Prisoner must be kept in gaol for nine months with hard labour, the sentence to date from the time of conviction, that was, that he should be kept in gaol for three months longer.

STAINED GLASS.

LYDDINGTON CHUHCH, WILTS.—On the 23rd ult., a new three-light stained-glass east window was unveiled by the donor, Mr. R. Large. The subject is "The Crucifixion." The window was designed and executed by Alexander Gibbs and Co., of Bloomsbury-street, W.C., under the superintendence of the architects to the church restoration, Messrs. Arundell and Tarte, MM.S.A.

CHIPS.

At the midsummer quarter session for Devonshire, held last week, it was agreed to increase the salary of county surveyor for the north district from £290 to £330, and that of the county surveyor for the south district from £290 to £300. It was explained that when the present surveyors took office in 1881 there were 192 bridges in the northern district and 182 in the southern district, since then 65 bridges had been added to the north district and 16 to the south.

The Duke of Buckingham's Committee has dispensed with the Standing Orders of the House in the case of the Manchester Ship Canal Bill, and allowed the Bill to proceed.

Messrs. Hardman and Co., of Birmingham, have just commenced the erection of the memorial window to the late Primus (the Right Rev. Bishop Eden) in the nave of St. Andrew's Cathedral, Inverness. The design represents the Last Judgment. The window, which measures 14ft. by 28ft., will cost about £500.

The Vice-Chancellor has been authorised by the Senate to accept the tender of Messrs. Luscombe and Son, of Exeter, for the erection of the new buildings for the University Library at Cambridge. The architect of the work is Mr. J. L. Pearson, R.A., of London.

New Liberal club buildings have just been commenced for the Liberal Association, Sudbury, Suffolk. The premises consist of large assembly or reading-room, recreation, committee, and card-rooms. The contractors for the works are Messrs. George Grimwood and Sons, of Sudbury and Ipswich.

A handsome memorial eagle lectern in brass has been presented to Ashover Church, and one to the parish church of Cannock, both by parishioners. In both cases the work has been executed by Messrs. Jones and Willis, of Birmingham and London.

At the monthly meeting of the Health Committee of the Cardiff Corporation, Dr. Paine, who has been medical officer of health for the town for over forty years, tendered his resignation. The Medical Department of the Board of Trade has on several occasions obtained Dr. Paine's opinion respecting epidemics.

The Metropolitan Board of Works have appointed Mr. Alfred Conder, F.R.I.B.A., district surveyor for Woolwich, to act as temporary substitute in the district of Eltham and Lee, which is vacant by the decease of the late Mr. G. Barnes Williams.

St. John the Baptist's Church, Bedford, was reopened by the Bishop of Ely last week, on completion of restoration after gutting by fire on the 28th July last year. Mr. John Day, M.S.A., diocesan surveyor, Bedford, was the architect, and Mr. S. Foster, of Kempston, the contractor; the cost has been £1,700.

Our Office Table.

THE annual excursion of the Architectural Association is fixed for August 15th to the following Saturday, and the neighbourhood of Bath has been settled upon, with the headquarters at the Royal Pump-room Hotel. The district to be visited will be found in the following maps of the 1in. scale Ordnance, Nos. 14, 19-34, and 35. The principal places included in the programme are Claverton, Hinton Abbey, Fairleigh, Norton St. Philip's, Wellow, Cheyney Court, Corsham, Laycock Abbey, Box, Bradford, Great Chalfield, and South Wraxall Manor Houses, Eddington, Trowbridge, Steeple Ashton, Westbury, St. Catherine's, Marshfield, Cold Ashton, and Humeswell. This Wiltshire trip, with such a list of buildings to be visited as are here enumerated, should prove one of the most successful and popular of the series of A.A. excursions.

THE *Dundee Advertiser* on the 4th inst., published a well-written description of a circular tour in the East Neuk of Fife, just opened up by the completion of the new Tay Bridge and the St. Andrew's line of railway. The article is illustrated by a large scale plan of St. Andrew's city, and by sketches of the villages of Anstruther and Pittenweem, of Broughty, Earlshall, Dairsie, and Balcomie Castles, Scotstarvit Tower, Markinch, St. Monan's, and Leuchars churches, Crawford Priory, Falkland Palace, and other buildings of interest in the district. The number, which is published at a penny at Bank-street, Dundee, will be useful to architectural students to whom the prize essay signed "A." in our "Competitors Column" of the 10th ult. has suggested Fifeshire as the district for a sketching tour.

THE Rev. John F. Kitto, vicar of St. Martin's-in-the-Fields, writes to state that an application having been made by the Metropolitan Board of Works for sanction to improve the southern end of Charing Cross-road by some alterations to the steps of St. Martin's Church, he will be glad if those who are interested in the matter will be good enough to inspect a model of the church and its portico, showing the proposed alteration, which will be on view every day between 10 and 4 o'clock in the vestry hall adjoining the church. Mr. Kitto points out that in the proposal is involved not merely the question of public convenience, but also the far more difficult and delicate question of the effect of the changes upon one of the additional features of the Metropolis. He will therefore be glad of expressions of opinion from those who inspect the model as to whether in their opinion the alterations may be carried out without marring the design of the church.

THE casket in which the burgess ticket will be presented to Mr. Andrew Carnegie to-day (Friday), on the occasion of his laying the memorial stone of the Free Library for Edinburgh, will be of a different design from the usual gold or silver "box" traditional to such occasions. It has been made of oak taken from the old Hope House, removed to make way for the Free Library. At one end of the bevelled lid of the casket is a representation in silver of the Hope House, as seen from the interior of the courtyard, and at the other a view, in repoussé work, of the accepted design, by Mr. G. Washington Browne, for the Free Library buildings. Along the length of the lid on one side is an inscription referring to the Library buildings; on the other the customary inscription setting forth why the presentation was made. The casket is panelled with open Celtic work in silver; at each corner is a lion or unicorn rampant with shield, and on the top of the casket is a bunch of Scots thistles. Messrs. Marshall and Sons, George-street, have designed and executed the casket.

A CROWDED meeting of workmen, convened by the London Trades Council, was held on Thursday, the 1st inst., at the Memorial Hall, Farringdon-street, to formulate a plan for reaching the apprentices in all trades throughout the metropolis, and inducing them to exhibit specimens of their individual work. Mr. George Shipton, the chairman, and Sir E. H. Currie explained the proposal, which was to hold an exhibition of works executed by apprentices in the People's Hall under the auspices of the Beaumont Trustees, during the Christmas holidays. The scheme was unanimously endorsed by the meeting, which pledged itself by resolution to support the project.

PREPARATIONS are being made at Bolton for the tenth autumn Congress of the Sanitary Institute of Great Britain, which will be held this year at the Town Hall of that borough. The Congress is divided into three sections, presided over respectively by Dr. Russell Reynolds, Professor Hayter Lewis, and Dr. August Dupré. The annual lecture to the Congress is to be given by Dr. Arthur Ransome; while addresses to the working classes are expected from Professor W. H. Corfield, Mr. Wynter Blyth, and Mr. H. Law. In connection with the Congress there will be a Health Exhibition, which the mayor of Bolton will officially open, in the Drill Hall. The scope of the subjects for discussion is sufficiently varied, as the respective sections deal with "Sanitary Science and Preventive Medicine," "Engineering and Architecture," and "Chemistry, Meteorology, and Geology." In addition to the several duties of the Congress, a conversazione and excursions are being arranged.

THE town council of Aberdeen seem to be greatly disappointed with the new peal of bells just procured from Belgium and hung in St. Nicholas' Tower. It is asserted that the carillon fails to fulfil public expectation both in point of harmony and volume of sound produced by the individual bells, of which there are in all thirty-seven, the contract price to M. Van Aerschodt, Louvain, having been £2,690, and the total outlay amounted to £3,326. The only partially remedial measure that can be carried out in the meantime is, the town council are advised, the removal of the louvres of the belfry windows, and certain structural alterations in the bell chamber. More serious difficulties will probably attend the regulation of the tone of the bells, several of them being much out of tune. This is considered all the more unfortunate in view of the fact that a deputation, accompanied by a musical expert, Mr. John Kirby, was specially sent by the town council to Louvain, at a cost of £157, to test and accept the peal on behalf of the subscribers. The town council held a prolonged and somewhat acrimonious discussion on Monday on the report of the bells committee, who desired that the council should remit back to them to take steps for remedying the defects of the new peal; but it was decided to consider the matter in committee of the whole council and report to a public meeting.

Mr. WALTER SMITH, of Southport, the well known railway contractor, died at his residence, Aughton-road, Birkdale, on Monday, at the age of 70 years. Mr. Smith had for years been a prominent man in Southport, having been for four years mayor of the borough. When first he went to Southport, nearly 40 years ago, he was a comparatively poor man, but as a railway contractor he was very successful, and at one time it was considered that he had amassed a large fortune. He, however, was unfortunate in the making of the Southport and Cheshire Lines Extension Railway, over which he got into difficulties which caused his failure. He went to Southport in 1849, when he was employed on the Lancashire and Yorkshire Railway extension from Waterloo to that watering place. After this he was frequently engaged by the railway company in repairing the lines and in other work, gradually working his way up, he improved his position, and then got larger contracts. He was a member of the Southport Town Council from 1867 until 1885. During the whole of that time he took a leading part in the improvements in Southport. He was one of the promoters of the Winter Gardens Company, the Southport and Churchtown Botanic Gardens Company, the Southport Tramways Company, the Southport and West Lancashire Banking Company, the Southport and Cheshire Lines Extension, and the Southport Building Society, being chairman of the latter for about 23 years. He was a justice of the peace for the borough and county.

THE Marquis of Lorne visited the Albert Palace at Battersea on Monday for the purpose of formally opening the National Smoke Abatement and Health and Home Exhibitions, which have been arranged within the palace. Lord Lorne said that, although the exhibition was as yet far from complete, there were many excellent exhibits already. Those who visited the 1881 exhibition of smoke abatement appliances would allow that the promoters of the present exhibition had much to congratulate themselves upon. It was not always in the third or fourth year after an exhibition of such a kind that an Act of Parliament was passed going much on the lines of those interested in the exhibition as the Smoke Abatement Act of 1884 had followed the show of 1881. Much had been done by the large manufactories in the adoption of smoke-consuming appliances, a saving of 40 per cent. being in some cases effected. Private hearths, however, undoubtedly contributed largely to the density of the city atmosphere, and yet smoke-consuming grates for private houses could be purchased very nearly as cheaply as ordinary grates. It was impossible for the principle to make advancement, he believed, unless it could be proved that its adoption would be best in point of cheapness as well as in point of warmth. The arrangements are, as usual in such exhibitions, at present in a very backward state, as yet not half the exhibits being in their places—a fact for which one excuse made is the sudden death of the contractor for the erection of the stands.

AN interesting and valuable picture, representing Parliament Close, Edinburgh, as it appeared at the beginning of this century, was acquired by the town council of that city last week for the low sum of one hundred guineas, having been purchased by a town councillor at his own risk in an auction for that figure. The picture, which is painted on a panel, and is 36in. by 26in., was designed by Mr. Thomas MacDonald—a Scottish artist who afterwards went to London in the early years of the century—and represents a collaboration of artistic work such as is rarely found—the names of Sir David Wilkie, R.A.; David Roberts, R.A.; Alex. Fraser, R.S.A. (who died in 1865); John Wilson, and others being associated with it. In the centre of the square are crowded 57 portrait figures of the most noteworthy citizens of the period, clad in Georgian costumes. A letter from David Roberts to Mr. Alexander Bryson, written in 1843, contains the following explanatory statement:—"I am not able to learn at what time it was commenced, but it was long in progress. The architectural portion of it, St. Giles' Church, with the old shops, were from drawings made by old Nasmyth, and drawn in and painted by the late Peter Gibson. The sky and old tower of St. Giles', painted by John Wilson; the figures, most, if not all, were taken from Kay's figures, and painted principally by Fraser—some, but I do not know which, by Kidd. The equestrian figure of Charles, with the pedestal, was painted by Abraham Cooper, R.A., and about sixteen years back I painted over a portion of the sky and background by glazing and toning it—which, previous to that being done, was a little out of harmony from so many different heads as well as hands being at work upon it. There may have been, and very likely, others employed in its manufacture, but these I know to be correct."

MR. JOHN THOMPSON, of Peterborough, the ecclesiastical builder, celebrated the Jubilee by inviting all the men in his employ to spend the day in the meadows attached to his residence, the Lindens, on the Lincoln-road. The grounds were thrown open at ten o'clock, when recreation was provided in the shape of a cricket match, nine-pin alleys, shying for cocoa nuts, jingling matches, &c. At one o'clock a substantial dinner was served in a large marquee, after which the sports were resumed. A band was in attendance, and played selections of music during the day. Between three and four o'clock the wives and sweethearts of the employés were admitted, when a number of ladies and gentlemen, specially invited by Mr. Thompson, arrived, and manifested great interest in the proceedings. About six o'clock the whole assemblage, numbering about 500, sat down to a knife and fork tea, when Mr. Thompson presided, and was supported on his right by Mrs. Thompson, the mayor and Mrs. Gates, and on his left by the Dean and Mrs. Perowne, &c. During the evening a telegram was received from Coventry from 100 of Mr. Thompson's workmen employed in that city, who were enjoying a similar feast.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Liverpool Architectural Society. Annual general meeting. Closing address by President, G. E. Grayson, F.R.I.B.A. 7.30 p.m.

TUESDAY.—Glasgow Architectural Association. Visit to Govan Church. 5.15 p.m.

THURSDAY.—Sanitary Institute of Great Britain. Anniversary meeting. Address by Dr. G. V. Poore on "The Shortcomings of Some Modern Methods of Sanitation," Parkes Museum, 74A, Margaret street, W. 3 p.m.

SATURDAY.—St. Paul's Ecclesiological Society. Whole day excursion to Salisbury.

Architectural Association. Visit to Sutton Place, Guildford, and Loseley Park. Trains from Waterloo, 9.45 a.m. and 2.45 p.m.

ARCHITECTURAL ASSOCIATION, 9, CONDUIT STREET, W.

The 4th Vacation VISIT will take place on SATURDAY, July 16th. Sutton Place, near Guildford, will be seen in the morning, and Loseley Park in the afternoon, under the guidance of Chas. Forster Hayward, Esq., F.S.A. Trains from Waterloo (main line) at 9.45 a.m. and 2.45 p.m., calling at Clapham Junction. Members who intend to go must please send postal order for 2s. 6d and stamped directed envelope to W. J. H. LEVERTON, 15, Whitehall-place, before WEDNESDAY, and state which train they intend to go by.

THOS. EDWARD PRYCE } Hon. Secs.
FREDERIC R. FARROW }

CHIPS.

The will of Mr. Christopher Raper, late of Corn Exchange-buildings, Seething-lane, architect and surveyor, who died on the 14th of June, has been proved, the value of the personal estate amounting to upwards of £86,000.

The Jesuit Church of St. Mary, Horseferry-road, Westminster, was reopened by the Archbishop of Westminster on Sunday week, after internal decoration in colour, designed and carried out by Mr. John Powell, of Bristol.

A Farmers' Exchange Club was opened at Warrington on Wednesday week. The architect is Mr. T. Beesley, and the contractors are Messrs. J. Collin and Sons, all of Warrington.

Messrs. Benham and Frowd (Limited) have erected a handsome brass eagle lectern, in commemoration of Her Majesty's Jubilee, in the church of St. George the Martyr, Deal; also a memorial eagle lectern in the church of Nettledon, Hemel Hempstead, and recently a fine silver gilt set of communion plate, also a memorial, for Rye Church, Sussex.

The new thoroughfare formed by the extension of Arthur-street, East, which opens up a roadway from the Monument to Billingsgate Market, was opened to public use by the Lord Mayor on Wednesday. The new street, which has been constructed by the City Commissioners of Sewers from plans by their engineer, Mr. William Haywood, has so far cost nearly £500,000. It will considerably relieve the traffic, hitherto most congested, of Lower Thames-street, while affording great facilities to other traffic. It is 454ft. in length, and has beneath it a subway 12ft. in diameter and 7ft. 6in. high, in the centre of which is a footway, a tramway being also laid for moving loads by trolley.

The Fraser Memorial Chapel in Manchester Cathedral will be dedicated by the Dean of Manchester to-day (Friday); the recumbent figure on the alabaster cenotaph is by Mr. Forsyth.

A new Welsh Wesleyan chapel at Llandudno was opened on Monday. Mr. Richard Jones, of Llanrhos, was the builder.

A conference of gentlemen interested in the promotion of technical education was held on Friday at the Society of Arts, Lord Hartington presiding, when steps were taken for the formation of a National Association with this object. Commercial and agricultural education will come within the scope of the association.

The Faculty of Advocates of Scotland have resolved to accept an offer made by the Earl of Stair, of a portrait of the celebrated Lord President Stair. The painting will be a valuable addition to the portraiture of the Parliament House at Edinburgh.

The anniversary meeting of the Sanitary Institute of Great Britain will be held on Thursday next, at 3 p.m., at the Parkes Museum. The chair will be taken by Sir Douglas Galton, K.C.B., D.C.L., F.R.S., who will present the medals and certificates awarded to the exhibitors at the Exhibition held at York. An address will be delivered by Dr. G. V. Poore, entitled "The Shortcomings of some Modern Methods of Sanitation."

A new chapel is about to be built on the grounds of the union workhouse at York, from plans by Mr. W. G. Penty, of that city. The chapel will seat 400 persons, and is estimated to cost £1,200.

The church of St. Thomas, in the Liberty of the Rolls, situate in Bream's-buildings, a brick edifice erected in the Norman style prevalent five-and-forty years since, is about to be demolished, together with the cottages on its eastern side.

Trade News.

WAGES MOVEMENTS.

STOCKPORT.—The bricksetters' labourers in Stockport are agitating for an increase of wages from 5d. to 5½d. an hour. They have recently formed an association, and threaten to come out on strike if their request is not acceded to. The members of the Master Bricksetters' Association say 5d. an hour is what is paid in other towns.

DUNDEE.—The strike of Dundee masons still continues. A number of the employers have given the halfpenny per hour of an increase asked, and work is proceeding at their jobs; but the majority of the masters are holding out, and their employés decline to resume work at the old rate of wages. Men are now becoming scarce in Dundee, and several employers who have large contracts on hand are anxious for a settlement. Work in other towns is plentiful at present, and a considerable number of men have left Dundee and got employment elsewhere. A number of the quarrymasters in the district have issued a notice to the Dundee Master Builders' Association which savours somewhat of boycotting those employers who have granted the increase.

Holloway's Pills augment the appetite, strengthen the stomach, correct biliousness, and carry off all that is noxious from the system. As this peerless medicine has gained fame in the past, so will it preserve it in the future, by its renovating and invigorating qualities, and the impossibility of its doing harm.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

BEST BATH STONE.

FARLEIGH DOWN, CORSHAM DOWN, BOX GROUND, COMBE DOWN, WESTWOOD GROUND. STOKE GROUND.

RANDELL, SAUNDERS, & CO., LD., CORSHAM, WILTS.

BATH STONE.

PICTOR and SONS, BOX, WILTS.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries, and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS, NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET. London Agent:— E. A. WILLIAMS, 16, Craven-street, Strand.

COX, SONS, BUCKLEY, & CO., ART WORKERS IN

WOOD AND STONE CARVINGS.

Southampton-street, Strand, London.

C. B. N. SNEWIN,

MAHOGANY, WAINSCOT, WALNUT, & TEAK MERCHANT,

Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, Back Hill, Hatton Garden; and 29, Hay-street, Farringdon-road, E.C.

The largest stock of thoroughly seasoned hardwoods, in all thicknesses, ready for immediate use. Telegraphic Address: "SNEWIN, London."

WM. OLIVER & SONS,

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BEDFORD.—For the erection of a house in Clarendon-road, for Mr. J. Barrand. Mr. R. Lund, architect. Quantities by the architect:—

Haynes, W.	£400 0 0
Smith, J.	343 0 0
White, J. P.	339 0 0
Harrison, G. (accepted)	338 0 0

All of Bedford.

BIRMINGHAM.—For laying gas mains and services, during five years, for the town council:—

Bird and Sons (accepted).

BLACKBURN.—For mason's work in boundary walls at the Blackburn and East Lancashire Infirmary. Messrs. Simpson and Duckworth, Richmond Chambers, Blackburn, architects:—

Woof-Cronshaw, W. J.	£395 0 0
Gregson and Ferguson	332 17 10
Carr, W.	324 15 0
Arkwright, W. and T.	306 10 0
Hindle, C.	300 0 0
Rowland and Williams (accepted)	265 17 8½
Johnson, A.	261 17 1½

All of Blackburn.

For wrought iron palisading:—

Exors of J. Baldwin, Blackburn	£154 0 0
Carr, W., Blackburn	152 10 6
Albion Ironworks Co., Rugely	144 19 0
Ashworth, T., Vulcan Ironworks Burnley (accepted)	110 0 0

BLETCHLEY.—For additions to Holne Chase, for Mr. J. J. Freeman. Mr. J. T. Sloan, Leighton Buzzard, architect:—

Wilford, B. and W. S., Newport Pagnell	£885 0 0
We'sh, H. W., Bletchley	849 0 0
Gardside, G., Leighton Buzzard	823 0 0
Cook, D., Leighton Buzzard*	800 0 0

* Accepted.

COLCHESTER.—For the erection of stalls, loose boxes, coach houses, &c., for the Colchester New Corn Exchange and Cups Hotel Company, Limited. Mr. J. W. Start, Cups Chambers, Colchester, architect and surveyor:—

Dupont, F., Colchester (accepted).

(Six tenders received).

CROYDON.—For additions and alterations at The Homestead, Bedford Park, Croydon, for Mr. A. Walton. Mr. C. Henman, 64, Cannon-street, E.C., architect:—

Colls and Sons, London	£600 0 0
Maides and Harper, Croydon	595 0 0
Garlick, J., London	533 0 0
Goulder and Glasscock, Croydon	517 0 0
Smith, J., and Sons, Norwood	495 0 0

EXETER.—For the erection of the Goldsmith-street arcade and extension to premises in High-street, for Mr. J. H. Newman. Messrs. Wilkinson and Warren, Post Office Chambers, Exeter, architects and surveyors:—

Stephens, J. G., Exeter (accepted).

(Lowest of six tenders received.)

ESSEX.—For new farm buildings at Witham, Essex, Mr. F. Whitmore, Chelmsford, architect:—

Smith, Chipping Hill	£615 0 0
Gozzett, Maldon	562 0 0
Moss, Chelmsford	475 0 0
Diss, Colchester	450 0 0
Ward, Great Totham*	425 0 0

* Accepted after allowing for oak on farm.

ESSEX.—For painter's and plumber's work at "Springholds," Rivenhall, Essex. Mr. F. Whitmore, Chelmsford architect:—

Farrow, Chelmsford (accepted).

ESSEX.—For alterations and additions to the Spread Eagle Hotel, Prittlewell, Southend-on-Sea. Mr. F. Whitmore, Chelmsford, architect:—

Carter, J., Southend (accepted).

FULHAM.—For painting, whitewashing, &c., at the St. George's Union Infirmary, Fulham-road, S.W., for the guardians of the poor of the St. George's Union. Mr. H. Saxon Snell, London, architect:—

Coombe, E. J., London, E.	£485 0 0
Bamford, W., London, W.C.	480 0 0
Sheerman, J., Junr., London, W.	427 5 0
Lilly, W. G., Pall Mall (accepted)	397 0 0

GRAVESEND.—For jubilee memorial clock tower. Mr. J. Johnson, A.R.I.B.A., architect. Quantities supplied:

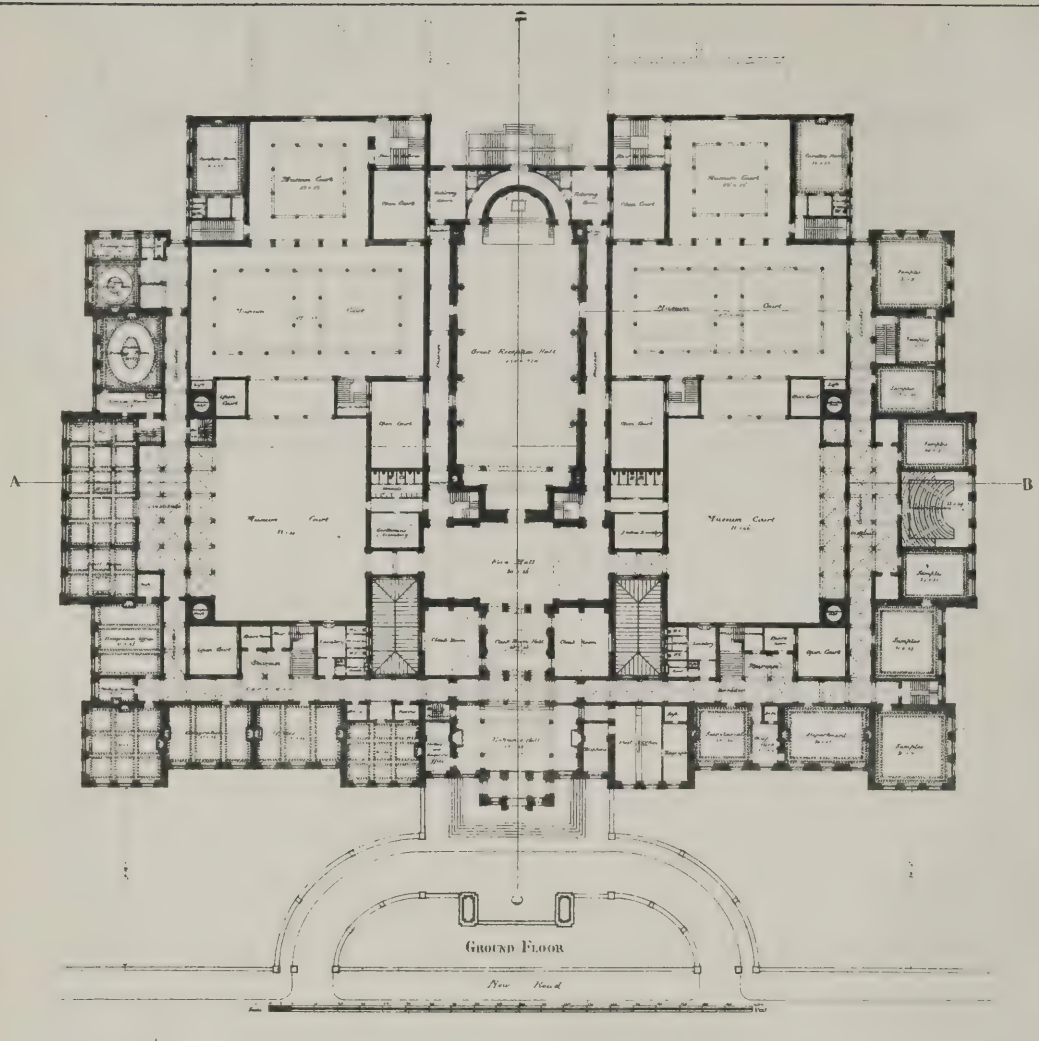
	A.	B.
King Bros., South Norwood	£848 0 0	£1,043 0 0
Philbey, A.	788 15 1	938 16 1
Falkner, J. W., Old Kent-road	757 0 0	952 0 0
Wallis, W. and E.	753 0 0	893 0 0
Multon and Wallis	649 0 0	727 0 0
Archer, W. H. (accepted)	635 0 0	675 0 0

Rest of Gravesend.

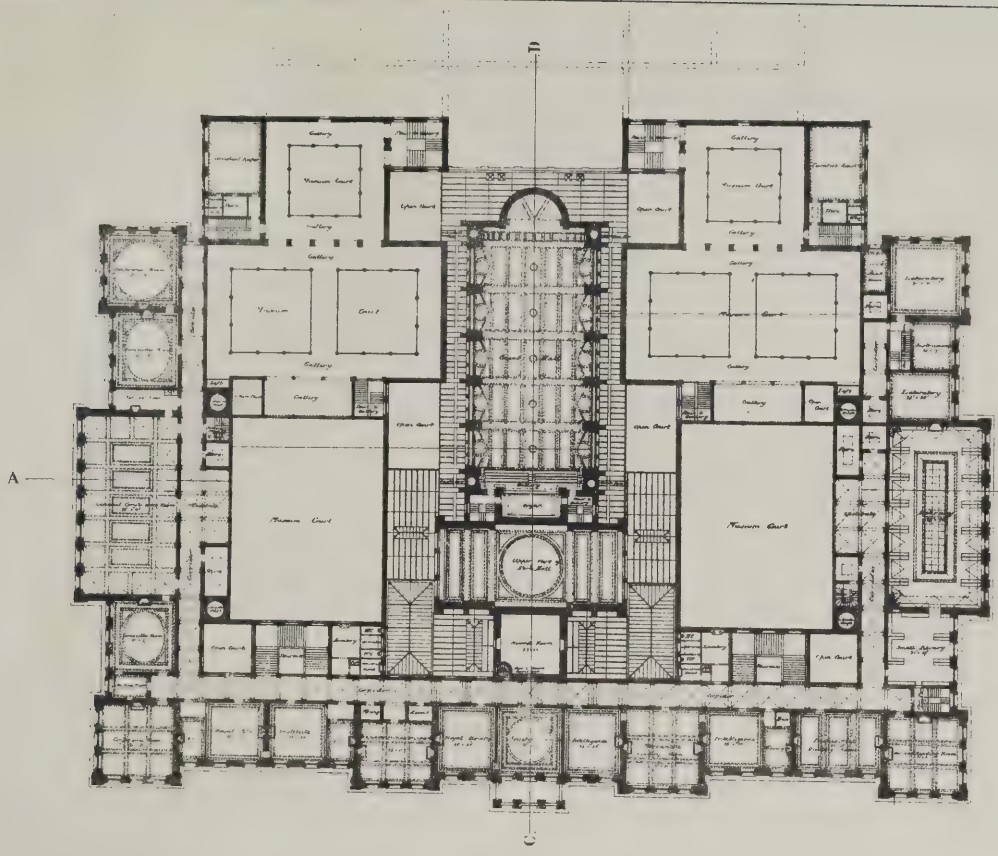
A.—Bath stone facing. B.—Portland stone facing.

GREAT GRIMSBY.—For building chancel and two bays of nave St. Paul's Church, West Marsh:—

Marrows, Grimsby	£2,470 0 0
Leaming, Grimsby	2,456 0 0
Grant, Grimsby	2,049 0 0
Wilson and Co., London	1,890 0 0
Jackson and Son, Hull (accepted)	1,750 0 0



HAMPSTEAD, N.W.—For alterations and additions to The North Star tavern, Finchley-road, Hampstead, N.W., for Mr. Miller. Mr. H. I. Newton, 17, Queen Anne's-gate, Westminster, S.W., architect:—



Mark	£997 0 0
Palmer	945 0 0
Burman and Sons	875 0 0
Buckridge	770 0 0
Lamble, Kentish Town (accepted)	717 0 0

HASTINGS.—For new detached villa residence, for Mr. T. Channon. Mr. G. F. Burr, M.S.A., 70, Cambridge-road, Hastings, architect:—

Warman, W. E., (accepted) 900 0 0

(Exclusive of stabling, &c.)

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1697.
FRIDAY, JULY 15, 1887.

BUILDING LEGISLATION.

WHEN the Metropolitan Building Act was passed in 1855 the chief intention of its framers was to prevent the erection of combustible structures. That motive arose, no doubt, from the vast number of wooden buildings in London, which was the cause of the Great Fire of 1666. Acts passed subsequently, in the reign of Charles II., in 1667 and 1670, in the reign of Anne (1707), and that of the first three Georges, were all directed to the reduction of risks of fire by party walls. The rules with regard to new streets and buildings in the Public Health Act have been framed after the same model. Very little, as we pointed out the other day, has been incorporated to insure sanitary buildings, an omission that is intended to be partially met by the Registration of Buildings Act. What is equally apparent to everyone engaged in the administration of the Public Health Act is the complete failure of attempting to put all its clauses into operation. In every considerable town there is a great deal of friction; the by-laws, which number 99, cannot be enforced, and the "jerry" builder is still allowed to erect buildings that are unfit for human habitation. The town surveyor has more than he can properly undertake. He has to attend to his daily duties, upon committees, upon sanitary and drainage matters, and a hundred other things, and he cannot be reasonably expected to be able to inspect all the new buildings in his district, and to see that in each case these clauses have been complied with. He would have to employ a large staff of inspectors to keep himself informed of the progress of the numerous private and other buildings, of their foundations, materials for mortar and walls, construction, details of drainage, &c. Nearly every week we record summonses against builders for sundry violations of the Act and by-laws; but there are hundreds of worse instances where the builders have evaded detection which are not reported. Inferior mortar and bad bricks and bonding are very common complaints, though it would be easy to find houses with as bad materials which have been erected and occupied. The machinery for inspection is far from being adequate to cope with the growth of new suburbs and the dwellings of a small class. Many of the by-laws are vexatious and inflict hardship on the builders, as the clauses referring to external and party walls. In some localities hollow walls are very necessary, owing to the porosity of the local materials; but the builder is compelled to follow very exacting rules, or his plans are discountenanced. We have heard of builders being put to unnecessary trouble owing to the want of a properly framed by-law. The regulations for half-timber walls are stringent. The clause requiring that "a thickness of at least four and a half inches of brickwork be placed at the back of every portion of timber, and shall be properly bonded to the brickwork filling the spaces between the timbers," is rather unnecessary if a cavity is made and a thickness of brickwork is placed internally.

The rules as to thickness of walls are rather perplexing to some builders, and we think there should be no party wall less in thickness than 13½in., or a brick and a half. As many of our readers know, the by-law determines that "where a wall does not exceed 25ft. in height, and does not exceed 30ft. in length, nor comprise more than two stories, it shall be 9in. thick for its whole height; if the wall exceed 30ft. in length, or comprises more than two stories, it shall be 13½in. thick below the topmost story, and 9in. thick for the rest of its height"; so that a wall of 25ft. in height of this length may be only one brick thick if there are not more than two stories, but must be one brick and a half thick if it includes three stories. The reason is not very evident for this change of thickness, except that there is greater risk of fire in the three-storied building. Is it not time some provision should be made to regulate the construction of the internal partitions of a house, which may be merely timber partitions covered with lath and plaster or boarding, offering no protection against fire; and also with respect to floors?

Many surveyors find fault with the clause requiring the party-walls to be carried up through the roof, which makes it difficult to keep out the rain, and entails expense in flashing. We are not inclined to recommend the omission of this safeguard against the spread of fire, although it may not improve the architectural appearance in those cases where chimneys are not taken up. We think the objection on this score to the penetrating walls is founded on the idea that a continuous roof gives the appearance of a large building, a not by any means logical conclusion. Why should not a row of street houses appear what they are? These raking parapets admit of being "stepped," and we can see no reason why they should retain a parallel line with the sloping roofs. They may also be made, in fact, rather picturesque than otherwise—an unbroken roof surface has never a very pleasant effect.

All the by-laws we have referred to have reference to the prevention of the spread of fire; there is little provided to insure healthful conditions, except the clauses as to the provision of damp-courses and those referring to drainage. Recent building catastrophes have shown that there are other matters which ought to be made subjects for legislation. One of these is the strength of walls to resist pressure of materials piled up against them. In the schedule for walls of the warehouse class, although extra thickness is prescribed, there is nothing about lateral ties; the thickness of the walls has been regulated solely in respect of fire precautions. If there were a clause preventing the use of warehouses for any other purpose than that of carrying loads on the floors, and another prescribing scantlings of joists and the weights to which they were to be subjected, there could be little to object to; but local authorities have only studied the risks of fire, and neglected all other considerations of safety to human life. Old buildings are entirely exempt from the law. In the conversion of one building to another, it has never occurred to the framers of these regulations that houses are turned into warehouses and shops, and that the requirements of walls and floors for the former purposes are quite inadequate in buildings of the latter class. The law as it stands is very ambiguous about the meaning of a "new" building, for unless the building is new it cannot be brought under the operation of the Act. The section referring to this technical point is by no means clear, and surveyors are puzzled whether a building partially destroyed by fire and rebuilt or largely altered is really amenable to the Act. The section says: "The re-erecting of any building pulled down to or below the ground floor, or of any frame building of which only the framework is left down to the ground floor, or the conversion into a dwelling-house of any building not originally constructed for human habitation, or the conversion into more than one dwelling-house of a building originally constructed as one dwelling only, shall be considered the erection of a new building." As will be seen, there are several loopholes for escape. In the first place, What is the ground floor? Is it the floor level or the story up to the ceiling? Is a partial reconstruction from that level, whatever it is, a "new" erection? Cannot an old building be taken down and rebuilt piecemeal? Old houses are daily converted into new ones without any regard to the powers of the urban authority, who are completely at the mercy of the builder. These are unfortunate circumstances, which hamper considerably the local surveyor, and lead to evasions of the Act in all important points. Stability of construction and sanitary precautions are set aside by all those who can show the building is not a "new" one under the terms of the section. The only way of rectifying the abuse is to legislate for all buildings let for commercial purposes and for habitation, whether old or new, after a certain date; for this purpose the minima of requirements for stability and sanitariness should be necessary conditions. There are those who advocate that danger from fire is a question chiefly affecting insurance companies, and might be very well left to those corporations; safety of human life and public health are things certainly which ought specially to be controlled by local authority.

OUR WATER SUPPLIES.

THE scarcity of water in many parts of the kingdom during the continuance of the present dry weather ought to set the local authorities, urban and rural, seriously to consider the means at their command in dealing with a drought that may be prolonged. In the smaller towns and villages the scarcity is experienced more than in large towns, owing to the power possessed by the latter for procuring supplies of water under the Public Health Act. Geological structure has a great deal to do with the question of supply in such seasons as we are passing through. In the central and southern parts of England the geological strata afford abundant means of obtaining water by boring; but in other parts, as in Ireland, where the rocks are hard and less absorbent and porous, the local water supply by means of deep wells is very limited. The Carboniferous Limestone is, unlike the Chalk, porous, and capable of storing away in its own underground mass a large quantity of the rainfall, and thus well-sinking is uncertain in its results, though even with rock of this sort something can be done in the way of collecting the rainfall or making use of so much of it that passes into the fissures of the ground. In rocky districts, such as those in which there has been a great outcry for water, unless there is a means of collecting the rainfall, the grievance is one of serious moment. In mountainous parts, like Wales, the rock surface resists percolation; the rain seeks a channel or a fissure through which it rushes or disappears, till it finds a permeable bed or soil in a lower or adjacent locality. The lower permeable districts receive their supplies from the high impermeable strata around; in short, the high rocky parts get very little or none of the rain which falls upon them, while the lower permeable districts get it all. This uneven distribution of the rainfall can be obviated by artificial means. In the hilly localities, which have suffered most, springs are numerous, and it would be easy to turn these to account. Within reach of many of the villages that have most complained of want of water, springs are to be found, and these may be readily tracked to their sources, and the water conducted through pipes. Professor Hull, LL.D., a year or two ago at a congress of the Sanitary Institute held in Dublin, read an important paper on the supply of water to villages in Ireland, in which he pointed out that the water-bearing beds or formations of a porous nature, such as the post-Tertiary deposits, sand, gravel, and loam, offer facilities for supply through wells,

and that wells sunk in these deposits are likely to yield wholesome water if they are driven to good depths and the surface drainage into them prevented. The remark applies equally to many parts of England, where, moreover, the Chalk, Lower Tertiary, Upper and Lower Greensand formations are to be found, these being all water-bearing beds.

A few years ago Mr. Bailey-Denton showed by figures how easily water might be stored for seasons of drought instead of being allowed to run to waste. In the BUILDING NEWS of September 4th, 1874, we referred to the subject, and now quote the figures. Mr. Denton estimated that every inch of rainfall on an acre of area is equal to 22,622 gallons, and multiplying this number by 32in., the mean annual rainfall, and by the number of acres in England and Wales, we got the product of 27,019,632 millions of gallons as the average amount of rain falling. Allowing for 25 gallons per head per diem as the quantity consumed for all purposes throughout the country, and multiplying it by twenty-five millions, the population, we obtain 625 millions of gallons per diem. Animal consumption, and the demands for steam and manufacture, increase the amount, but the aggregate does not exceed 1,000 millions of gallons per diem ; in other words, only a 74th part of the total rainfall. In short, if we allow only one inch of rainfall to an acre of surface, a year's supply is guaranteed to about two and a half persons. These calculations applied to the drought in 1874, which, like the present one, was much felt in the Lake district. In Wales and the Lake district the mean depth of water that runs off in the shape of floods is stated at 20in. ; in the East and Midland districts it is about 6in. Mr. Denton points to storage of the surplus water to compensate for these irregularities. The surplus he estimates at an average of 15in. And as to the means : in chalk districts underground tanks can be formed cheaply, lined with a cement facing ; in other less favourable districts, tanks or reservoirs may be constructed with local materials. An ordinary country house and outbuildings may, if provided with proper guttering and downpipes, collect 20in. of water in the year, or 28,280 gallons. Every country house ought to have Roberts's rain-water separator, for storing the pure portion of rainfall. If the villages can combine, a reservoir to hold a month's supply may be secured ; and for agricultural and animal use underground tanks and ponds can be cheaply formed. We hear of several villages and country towns suffering from scarcity of water, which could not have occurred if a combined effort had been made to carry out a system of collection by tanks in the manner suggested. If the Legislature had assisted in such a scheme, by granting large powers to landowners having a life interest in villages to become water contractors, and to construct storage tanks upon their estates by borrowed capital, to be repaid during a term of years by the consumers, the present dilemma could not have arisen. There is now little authority over the watershed areas of the country. The present rural and urban boards are often at loggerheads ; drainage is their chief regard, and water supply is left to look after itself.

As an illustration of the necessity of doing something, we may refer to the condition of the ratepayers of Rawdon, in Yorkshire, who have just memorialised the local board of that town on the inadequate supply of water from the Yeadon Waterworks Company. The town of Rawdon has to mainly rely upon that company for water ; but for weeks past the supply has been insufficient, and, it is said, unfit for drinking purposes. The difficulty of obtaining water, the petitioners say, occurs every summer, and they add if proper provision were made for storage, an abundance of pure water might easily be obtained to supply the whole of the township, even in the driest of seasons. As it is in Yorkshire, so we have complaints from Lancashire and other counties. Swansea, surrounded by water, is in dire distress, and recourse is even had to an old coalpit for water, which is being pumped, carted, and sold by the canful, according to a letter in the *Times*. Like Manchester and Liverpool, and a dozen other towns, Swansea has been handicapped by Act of Parliament, and one-third of their impounded water has to go to supply mills, and if they cannot supply, the town must pay compensation to them. London alone amongst great cities has at present not much to complain of, though the fresh-water supplies of the Upper Thames are getting less every day. The Thames and the Lea each contribute a moiety of the 160,000,000 gallons per day supplied to London, and this quantity during a long, dry season is a considerable abstraction from the resources of a river supply. The growth of population along the river basin, and the increase of buildings and farms yearly, diminish the quantity and quality of the supplies. If complaints of insufficiency of supply were made sixty years ago, how much more have Londoners now to dread a water famine, or, what is worse, a contaminated supply. It is the natural tendency of all sources to diminish as the population increases—a fact which cannot be disregarded. There is a limit, too, beyond which it would not be safe to go. With the increase of towns, pollution increases, and corporations and local authorities are compelled to look at probabilities and to make preparation for any emergency that may arise. Many of the schemes that have been put forward to meet the increasing demands of London have been proposed during the past half-century. In 1834 Mr. Telford proposed to bring a supply from Hertfordshire and Surrey, and a great reservoir was to be constructed at Watford, and another at Clapham Common, thence to be distributed by the existing companies. Robert Stephenson suggested in 1840 a supply from chalk wells near Watford ; other proposals followed for drawing supplies from the Thames at Henley and Mapledurham ; Hawksley proposed an aqueduct scheme to bring water to Hampstead ; Mr. Bailey Denton a scheme for tapping the upper tributaries of the Thames, including the Cotswolds district, the rivers Wey, Colne, Mole, and Wandle contributing. Besides the valley schemes are to be noted the chalk-well schemes, such as that proposed by Mr. Homersham, to supersede the river supplies ; and lastly, though not least, the north-country proposals, as the ambitious scheme of Mr. Bateman, who selected the mountainous districts of North and South Wales, or the Plynlimmon range, which form the gathering grounds of the Severn, the water from which he proposed to convey by conduits and an aqueduct viâ Stourbridge, Warwick, Berkhampstead, and Watford to a large reservoir at Stanmore, near London—a distance of nearly 200 miles—thence to be distributed to the existing reservoirs. Latterly the Lake districts have been proposed. The Thirlemere and Hawes-water scheme is within the recollection of our readers. Ullswater was to be tapped and the water conveyed to London by gravitation. The spoliation of the scenery of the charming Lake districts was a strong objection to this and similar proposals. More practicable and less destructive would be a scheme for supplementing the present supplies by tapping the tributaries of the Thames, and by making chalk wells contributory.

Prince Albert Victor of Wales will visit Woodford to-morrow (Saturday) to lay the memorial stone of the new schools to be erected by the Drapers' Company on the Manor House Estate, Woodford Wells.

THE PROFESSION OF A CLERK OF WORKS.*

By THOMAS POTTER,

Author of "Concrete: its Use in Building," "The Construction of Silos," &c.

(*Continued from page* 9.)

IT is very evident to every one of us that no man can affirm he knows every good and bad point, and how best to perform one and avoid the other of the innumerable details of construction and ornament which together make the sum total of the many trades and occupations necessary for the erection of large and important buildings, and some of which may by accident come within the experience of the clerk of works engaged thereon only once or twice in a lifetime. It is quite within bounds, therefore, to say, and without any discredit to him, that he is never thoroughly proficient in his profession, for even assuming that it were possible to master the ins and outs of all the usual building trades, there are new processes and improvements cropping up daily which are supposed to be included in the category of works to be supervised. I say "supposed" advisedly, for it is only a supposition. Electric lighting, hot air, and other heating appliances, hydraulic arrangements, and the like are, perforce, wholly or partially handed over to specialists of repute to perform, and, assuming such specialities fulfil their purpose, the latter are taken to as satisfactory. What it amounts to, therefore, is this, that a clerk of works should know practically as much about the various processes and details required for the erection and completion of buildings of considerable pretensions as can be reasonably expected of a man who has for the major portion of his life hitherto been engaged in learning and working for this object. Another reason why a clerk of works should acquire as sound a practical knowledge of the various building processes as possible is that the workmen engaged on a building collectively, by a kind of Freemasonry, soon arrive at a verdict as to his capabilities, and "Yea" or "Nay" has a good deal to do with good or bad workmanship even when the workmen are efficient. If he is incapable of telling if workmen are inferior in skill or the materials in quality, the former have no incentive to do their best, for, as a rule, the builder's foreman has no qualms of conscience if the clerk of works is satisfied ! indeed, it has been known for building mechanics to execute their work in an indifferent manner with the simple object of ascertaining how bad it may be done without complaint, making, in point of fact, the quality of the workmanship a test whereby they may fix the clerk of works' standard of efficiency. This idiosyncrasy on the part of certain workmen may appear overdrawn ; but if not a common occurrence, it is, nevertheless, true, and is an important factor in dealing with the views expounded by Mr. Seddon and other experienced architects—viz., that the workmen should be elevated beyond the standpoint of a mere machine, paid to do so many hours' work per day for so much an hour from certain hard-and-fast instructions, and which his hands are to perform without the assistance of his mind—a piece of human clockwork wound up on Monday morning and which runs down by Saturday night—and instead thereof, made to feel he has an interest in the work he is performing and a personal responsibility in the result. Just as the design of a building may be judged by the capacity and earnestness of the architect, so is the stamp of construction and finish set upon it and distinguished at a glance by the building expert, whether it ranks good, bad, or indifferent, by the amount of intelligence and mindfulness brought to bear upon it individually and collectively by builder, foreman, clerk of works, and workmen. On this point, however, much might be said with regard to the difficulties which beset everyone concerned in their endeavour to fix the stamp of sound and earnest construction upon the building in hand. The workmen are aware they must do a certain quantity of work or it does not pay their employer ; the employer's very existence depends on his getting that and other buildings done for certain fixed sums, and whatever may be

* All rights reserved.

he character of the workmanship the job must nder any circumstances be made to pay ; the oremen know this also, and that a good margin f profit to the contractor is the most likely vent to forward their interests, and if all three lasses pull together to one common end, and nly one—that of making money out of the ontract—the clerk of works may do all he can, ut it would be impossible to obtain satisfactory esults ; more especially is this the case when ie finds the owner of the buildings taking sides n matters of disputation with the builder or is representatives, and leaning towards them nder the false notion that the clerk of works *ust* find fault or he would not be fulfilling his luty. True, this does not often occur, but hen it does it adds to the difficulties the clerk f works has to cope with. Almost the first matter which the clerk of works should lo after having obtained possession of racings of the general drawings is to heck the plans ; that is, to ascertain hat all figured dimensions in detail correspond with the full figured dimensions. For instance, assuming that on the plan of a church the limensions are given of width of buttresses nd the spaces between them, constituting ogether the full length, say, of the nave ; these should be added together, and if the otal is the same as the extreme length, it is evidence of the figures being correct. All plan dimensions of a building should be gone into in this way, and as soon as time permitted, the sections showing heights dealt with in a similar manner ; and the headways of stairs should have considerable attention, for difficulties often crop up in this respect which should have been remedied in time. When the plan is drawn to a small scale it is often advisable, where time permits, for the clerk of works to reproduce on a larger scale, ½in. to a foot at least, a "working plan," and figure thereon all dimensions, whether given in the original or not, which will be required in setting out the work. It should be traced on linen, or stretched or mounted on a deal framed panel, and a light deal cover or flap hinged to the latter with webbing, so as to open and close either way, is advisable, with the view of protecting the plan from rain and dirt. It is not a fact that so much care is taken in architects' offices to prevent errors, that nothing of the kind is possible, for continual interruptions, pressure of work, and the relegation of matters of the kind to junior clerks or draughtsmen, will unavoidably often be the cause of occasional discrepancies in the plans and sections. By taking the very earliest opportunity of calling his architect's attention to these discrepancies, instead of creating offence thereby, the clerk of works will obtain credit for his astuteness in detecting small errors at an early stage of the work, and without the necessity of alterations having to be made, and a builders' extra created. Where the dimensions on plans and sections are not figured in sufficiently, or but very sparsely, it is well for the clerk of works to do this himself in his office ; indeed, he cannot well add too many figures, so long as the remedy is not worse than the evil through rendering them too confusing and intricate. The difficulty of attempting on a scaffold, with the wind blowing a tracing about in all directions, to scale some "opening" or "set off" with a two-foot rule, can in most cases be avoided by figuring in the dimensions and distances beforehand. For certain works—extensive alterations, for instance—where dimensions have to be taken to enable plans to be prepared, and existing buildings cover the site, it will often be found when old portions of the buildings are removed, that there are considerable variations in detail, although the plans in the main are correct, and in such cases a working plan with the various breaks, set-offs, and openings figured in, or laid down to a large scale, is almost a necessity if blunders are to be avoided ; in fact, it is a work of this kind which in dealing with needs a greater amount of common sense and practical experience than entire new buildings of much more elaborate and costly description require. And the dimensions figured in or scaled of detail drawings should be compared with the general drawings at an early stage of the work, not left till the work has to be put in hand, and if an error is found the architect has to be communicated with. So with the specification : if the latter specifies certain things to be done which are impracticable from local or other causes, ample notice of this should be sent to the architect, that the subject may have proper consideration. A habit of taking time by the forelock in matters of the kind, but after full consideration and deliberation, is a necessary qualification for every clerk of works to possess. Tact is, too, an essential qualification ; although it is assumed that the clerk of works has direct dealings with the builder or general foreman only, there are still many occasions where the matters of complaint are too trivial and too frequent to render it necessary he should interview those in authority. The bricklayers may be laying their bricks too dry, or not grouting their brickwork courses at certain intervals as specified ; their labourers are adding too much sand to the lime, or the cement is getting set through being mixed up too long before use ; carpenters are making ill-fitting joints or improperly fixing roof or floor timbers ; masons are undercutting ther stones far too much, so as to make neat-looking close joints when fixed ; plumbers are "tucking" their flashings in masonry or brickwork joints an eighth of an inch or so—for is not the mason going to follow on at once pointing, and who will be a jot the wiser? And so on. A little mild persuasion remedies these matters better than a larger amount of blustering, especially where the latter is the usual method adopted for counteracting *laches* of this description. Workmen are apt to connect a great deal of bluster with an inverse proportion of practical knowledge, an assumption which often proves correct. Another matter of tact consists in dealing in a circumspect manner with those in authority connected with the work. It should never be forgotten by the clerk of works that although the architect does not as a rule pay his salary, he is solely responsible to him for what he does, and should not act as a go-between with any third parties. He should make no suggestions for alterations, improvements, deviations, or omissions, except to the architect or by his directions, or with his full knowledge and consent, and which latter should be clearly intimated. The clerk of works who seeks to ingratiate himself in the good graces of his employer or employers by parading his own knowledge, and suggesting how this, that, and the other may be improved, risks doing so at cost of getting into disfavour with his architect. It is quite within his duties, however, to inform the latter of any way in which certain improvements, according to his views, may be effected, and he is often well able to do this, because the gradual erection of a building develops occasional matters of detail which a person who is constantly on the work, and whose whole attention is directed thereto, is in a much better position to deal with than the architect who is far away, who has only the plans to refer to, besides various other works to look after, and divers matters to think about. It is an unfortunate failing possessed by some clerks of works that they cannot refrain in an insinuating tone of speech from making their employer or employers aware that it was through their suggestion that this thing was done, or the other matter altered, or in some other way endeavouring to bring under his or their notice the fact that they possess a clever clerk of works. This kind of thing is obviously more noticeable amongst those whose experience in the position they occupy is limited, for as they acquire more practice they at the same time gain more prudence, and find that the endeavour to curry favour with certain individuals is often the means of losing it with those to whom they have to look for future employment or recommendation—their architects. It should be a settled point, as far as the clerk of works is concerned, to use the pronoun "I" always with discretion. A clerk of works should never find out errors where none exist ; if he believes that certain details are not being carried out according to the plans and specification, he will make doubly sure that such is the case before bringing them under the notice of the builder's foreman, and having done so, firmly insist on undoubted errors being at once remedied. Nothing makes a man look so little in the eyes of workmen—supposed to be beneath him in general knowledge of constructive matters, or is so much an incentive to the foreman to ride the high horse on future occasions, as for the clerk of works to discover mistakes where none exist, nor on examination admit of a doubt. Although the clerk of works should check all and every measurement, he should not undertake to set out work for the builder, not even as a friendly action, unless the latter is prepared to accept the responsibility. Even then it is best left alone, for should an error take place, unpleasantness might follow as the result thereof. So with regard to levels ; the usual method of employing a long straight edge or board and spirit level, more or less true, sometimes resulting in the bricklayers finding themselves when "tumbling" in the foundations, a course of bricks out when they have worked round to the starting-point, should be left entirely to the foreman, except where a surveying level is employed, and then the objections on this score do not exist. The advantageous qualification of being able to measure and value executed work is one which unfortunately too few clerks of works possess. How much time and contention might be saved if, instead of measuring extras and omissions after the works were completed, they were taken at the time the buildings were in progress, and agreed to by the builder or his representative, roughly drafted into form, and sent to the architect at stated periods. Nor would such a matter be a difficult undertaking, assuming the clerk of works to be but a moderate arithmetician, for the system and practice of taking and working out plain measurements are readily acquired by any man who has the names of every constructive detail by heart. The clerk of works well knows the meaning of reveals, arrises, weatherings, throatings, mitres, toothings, cuttings to hips and valleys, &c., and the hundreds of other technical phrases employed about a building are as "familiar in his mouth as household words" ; and whereas other individuals not so fortunate have to learn the signification of quite a dictionary of terms, before they can attempt to measure artificers' work, the clerk of works has acquired them long ago. Excellent instructions as to the best systems of quantity taking are contained in Fletcher's "Quantities," published at 5s. Beaton's "Quantities and Measurements" is a smaller work of a similar nature, one of Weale's series, costing 1s. 6d. Measuring executed work and taking out quantities from the drawings are so very similar, that if moderate proficiency is obtained in either, the other becomes an easy matter. As with drawing, so with quantity taking—perseverance, and practice are the main elements in obtaining success. Estimating may not come within the scope of a clerk of works duties ; nevertheless it seems to hinge on, so to speak, to measuring and quantity taking, and must not be lost sight of, and should the clerk of works happen at any future time to develop into a builder and contractor of large practice, he will find it extremely useful. "Estimating by a Practical Estimator," originally published in the BUILDING NEWS in 1883, to be purchased for 5s. 6d. of Batsford, 52, High Holborn, is a handy companion in this respect, and while upon the matter of technical books, it may not be out of place to remark, for the guidance of clerks of works, that should there be any unaware of the most suitable places for purchasing architectural or building works, or of ascertaining where they can gain information as to what works are published dealing with special building matters, this is one of them : Spon, 48, Charing-cross, and Crosby Lockwood and Co., 7, Stationers' Hall-court, are also publishers of many technical books extremely useful to clerks of works.

To furnish reports at fixed intervals, including a valuation of the work executed, considered by Mr. Hoskins as a qualification that the clerk of works should possess, is one, however, the latter portion of which, as a rule, can only be dealt with in a haphazard kind of way. He may be totally unacquainted with the locality, and therefore know nothing as to the price of local stone, sand, lime, and other building materials ; the builder may, perhaps, quarry his own stone, burn his own lime, or make his own bricks, or the clerk of works may have had no previous experience of the kind, and therefore never troubled himself about the value of brickwork, excavation, concrete, rough timber, joinery, leadwork, and innumerable other items. Many men who take an interest in the cost of work and value of materials, and are quick at figures, are necessarily able to do this with quite sufficient accuracy for the

purpose intended; but unless experienced in estimating prime costs, the clerk of works should be very careful in making statements which after all can only be approximate. It sometimes happens that the builder, before he completes his contract, is supposed to be on the verge of bankruptcy, and rather than have the works stopped and incur the difficulties and delays occasioned by dealing with bondsmen and assignees, the building is kept going, and the builder on his legs, in hopes that he may pull through till the works are completed, by advancing money beyond what he is actually entitled to, and the clerk of works in such cases should be more than usually careful and circumspect in his reports of what is being done and what remains to be finished.

(To be continued.)

SEWER VENTILATION AND OTHER APPLIANCES.

THE admitted difficulty of controlling the currents of air in sewers has given much trouble to sanitary engineers. Experiments made with a view of discovering the best mode of ventilation have shown that the ordinary road gratings in a line of sewer often act in the two-fold manner of inlets and outlets, as the varying temperatures of the outer sewer air and other conditions prevail. The Æolus Waterspray, Ventilating, and Electrical Engineering Co, 124, High Holborn, have, by the application of their well-known Æolus waterspray ventilator, shown that it is quite possible to control the current or compel it to travel in any desired direction. By the introduction of one of the down-cast or wind-catching heads fixed to a shaft, with a spray into the crown of a sewer at any point, fresh air can be driven down into the sewer. At another or upper point of the same system, an exhaust ventilator is fixed of a siphon-shaped form, in which is another bell-mouth spray, the action of which creates a vacuum, exhausting the gas and driving the air up an upcast shaft which may be placed against any building or lamp pillar. By the combined action of the inlet and exhaust ventilators, a powerful current is maintained against the flow of the sewer. These may be placed at any convenient distances apart. We have had the opportunity of inspecting some working models of this system in which the smoke-test was applied, and directly the sprays were set in motion, a strong current was instantly set up. The siphon outlet and spray can be inclosed in a chamber or casing having a small door by which the spray can be regulated. When sea-water is employed for the sprays, a special spray is used, and a cylindrical filter having diaphragms at intervals is employed for screening the seaweed and other particles before the water passes the spray. This special filtering apparatus has convenient means for cleaning the sieves or meshes, which are of different degrees of fineness. The same principle of ventilation is shown applied to a passenger ship. The "Æolus" is fixed to the fore bulkhead, and is worked by a pump in the engine-room. The spray is of the "Turbine" pattern, permitting the particles of sea water to pass; the spray occupies the whole space of the cylinder, and drives the air before it. A vacuum is thus created behind the spray, the air being thereby sucked in through it, and enters the hold or cabin through a main shaft with vertical inlet tube; a second or exhaust "Æolus" exhausts the vitiated air from the upper part of the cabin, and thus a constant change of air is effected. The waste water is carried off by a waste-pipe. The down-cast cowl patented by this company, and fixed to the down-cast Æolus, collects the wind from any point, and drives it down to the waterspray. In case of a heavy sea entering the inlet-shaft, there is a hinged basin-shaped bottom at the bend of shaft, which tips down and discharges the water on to the deck. The exhaust can also be surmounted by an automatic exhaust ventilator, so that without the waterspray self-acting ventilation is secured. The advantage of the "Æolus Waterspray" for creating currents cannot be denied, and we believe that for sewer ventilation the system can be economically applied in very many cases which have defied the ordinary treatment.

We saw a working model of the "Capell Double-power Exhaust Fan," for which the Æolus Water-Spray General Ventilating and Electrical Engineering Co. are agents. For ventilating purposes this fan appears to be exceptionally good, and a more powerful exhaust we have never seen. The fan consists of two sets of six blades, an inner and an outer set, shaped to a particular curve. The outer blades are fixed on a drum with openings. Its efficiency has been tested, and excellent results have been attained with a small velocity of blade tip. For drawing off foul air, vapour, dust, and smoke, the Capell fan is well suited.

Our attention was also directed to an incandescent electric light on an economical system, suitable for domestic use, and avoiding the expense and space required for engines and dynamos. The lights we saw are fed by primary batteries, which do not take up space, can be placed anywhere, and require no skilled attention. All that is necessary is to recharge the batteries once a week or fortnight, though the company undertake this duty if required. The cost of the incandescent light is very little more than gas, the user having all the advantages of a brilliant, steady light without vitiating the atmosphere of the room, as is the case with gas, oil, and candles. We are informed that one battery of eight cells will maintain ten lamps of 5 candle-power. The three Swan lamps we saw burning can be maintained for 60 hours by one charge of the battery, and the cost of one charge is about 4s., or, in other words, the cost is about one-third of a penny per lamp per hour. With the cost of production reduced by these means, the electric light must soon become a formidable rival of gas.

AN ALTAR IN GOLDS AND COLOURS.

DURING the past week an exceptionally interesting example of church furniture has been on view at Mr. J. Aldam Heaton's studios in Charlotte-street, Bedford-square. We refer to an altar which has been just finished for St. Margaret's, Ilkley, Yorkshire, built a few years since from the designs of Mr. R. Norman Shaw, R.A.* The treatment adopted is decidedly original in idea, and is intended to obviate the use of embroidered altar frontals by introducing a series of seven panels decorated with figures of censing and musician angels painted in colours on a burnished background of yellow gold. The frame work, which is designed without mouldings in plain divisional uprights and rails, is also covered with gold, and throughout is enriched with Italian ornaments in browns and yellow-browns painted over the gilding. The wings of the angels and the nimbus of each figure are drawn with an incising tool on the burnished gold, and this work is very cleverly picked out and heightened by lacquers, which tone the sheen of the groundwork and serve to bring out the features to which they are so ingeniously applied. The framing of the altar, as well as the panels, are made of mahogany, the altar top being a stout slab of solid oak fumigated and polished, with five satinwood crosses inlaid on the upper face. The altar is ten feet long, and it will stand against a setting of alabaster with red dossal hangings over. The figure panels were all painted by Mr. W. H. Margetson, and there is considerable merit in his work; but to our minds the detail of the draperies lack study and finish. This effect is no doubt heightened by the highly elaborated and burnished background in which the angels are placed. The artist would have done better had he followed such artists as Memling, dealing with more attention and care to detail rather than aiming at a superficial breadth of effect so fashionable among French decorative painters. Along the frieze of the altar are inscribed the seven gifts of the Holy Spirit in little jewel-like panels amongst the Italian ornaments. The bottom rail is shaped, allowing ample space for the toes of the priest when celebrating. The panels of the altar at the ends are decorated with foliage corresponding with that on the framework.

The parish church of Crathorne, near Picton Junction, in the North Riding, is about to be restored, from plans by Mr. E. Hodgson Fowler, F.S.A., of Durham.

* A double-page illustration of this charming church was published in the BUILDING NEWS for May 13th, 1877.

OUR COMPETITORS' COLUMN.

THE papers sent in for our seventh competition are, taken all round, very creditable. The best is undoubtedly that by "Studiosus," to whom we award the prize. Several other papers are almost of equal merit, and, with some hesitation, we place that by Mr. Charles T. Taylor second.

We now offer another prize of One Guinea for the best

SUGGESTIONS TO ARCHITECTURAL SOCIETIES

for sessional papers next year, with hints as to subjects most appreciated by members, illustrated, if desirable, by references to and comparisons with past papers.

To be sent in by Friday, July 15.

Another prize of One Guinea for the best short essay, naming the architect who, during the past thirty years, has

MOST DECIDEDLY INFLUENCED ECCLESIASTICAL ARCHITECTURE IN ENGLAND.

To be sent in by July 22.

And another prize of One Guinea for the best paper giving

THE EXPERIENCES OF AN ARTICLED PUPIL,

comprising such hints for self-improvement and the best utilisation of time and resources as may benefit others. Papers giving actual personal experience will be preferred.

HINTS ON ARCHITECTURAL DRAUGHTSMANSHIP.—(BY "STUDIOSUS.")

The subject falls naturally under two heads—that of mechanical or geometrical drawing, and that of freehand. There is not much to be said on the former. Anyone can become a good mechanical draughtsman by dint of practice, and a determination to succeed, whether he happens to have artistic ability or not. At the same time it may be useful to hint at certain principles of good taste which apply to mechanical drawing. First, it is well to bear in mind that a geometrical drawing *is* a geometrical drawing, and not a picture, and that the two cannot be combined without destroying the effect of both. If a drawing is to be a mechanical and mathematical representation of a building or any other object expressed by lines as a formula is by letters and figures, let it be that and nothing else. Don't aim at effect. Let it be as mechanical as it can be made, and never draw a line therein if you can rule it instead. The common practices of "breaking" brick lines on an elevation and darkening the corners of windows are everyday instances of what I mean by trying to gain effect. But, however mechanical the drawing may be, there is room for taste and discernment in the arrangement on the paper, choice of colours for materials in working drawings, and the type and excellence of writing employed for titles and description. I venture to think these little matters, though not in themselves of great importance, serve to show whether a man is careful and takes pride in his work or the reverse. One good result of the competition system has been the great increase of excellent draughtsmanship. The six sets of drawings for the Imperial Institute lately exhibited are model instances of technical draughtsmanship, whatever other merits they may or may not possess. Proficiency in technical draughtsmanship is the very A B C of the youthful architect, the first rung of the ladder worn by the mounting of so many illustrious feet and it can be attained, and must be attained by any and every member of our profession who intends to reach the top. Much might be and has been, written on this subject, but I think a few general hints are all that can really help the student who, if he be in earnest will conquer the little difficulties, and invent the little technicalities belonging to the subject for himself, better than anyone can tell him. This remark also applies to the second division of my subject, freehand drawing. I include all drawing under this head that is not performed with mechanical aid, in which the student must rely on truth of eye and skill of hand alone. I have no hesitation in saying that an architect should be able to "draw anything" just as much as a painter. It should be as easy to him as writing. To acquire the power he should begin very young, and acquire it while young, and once learnt it will be the very "open sesame" to him all his life. I would have every embryo architect, before entering the profession at all, spend at least two years in drawing from the antique and the life. If he cannot draw them at the end

vo years, let him go on trying till he can. Then he can he will be able to draw any building ever yet erected, and anything else besides. his is the ideal of this portion of architectural ducation, seldom, I fear, realised. The ques-on naturally arises, What are those students do who have been unable to enjoy these cilities? I suppose the question applies to e vast majority who do not choose their pro-ssion till after leaving school, and who con-quently have been unable to begin very ung. I venture to think that, although it is ndoubtedly a characteristic of many great en that they began their profession as soon as ey could walk, in many the talent for any ecial line in life does not develop till child-od is over. It is then obviously no use telling e latter that they ought to have begun years o. They have got to begin now and make up r lost time, and, given a foundation more or ss deep of artistic ability, industry, and a de-rmination to succeed, I firmly believe they ll succeed. The youthful architect must aw and draw till he *can* draw, and above all, possible, get a good drilling in the repre-ntation of the human form divine, antique d living. As I remarked above, the knowledge this will meet every emergency. If he nnot do this from want of time or oppor-nity, or any cause, let him not, therefore, spair of becoming a good and facile draughts-an. Let him take every opportunity of sketch-g, not necessarily buildings, but anything at strikes his fancy, and let him get his incipal or some artist friend to correct his rors. He will gradually find that he is gain-g the power and facility he aims at. I am are that there are some who would meet ese observations with the just remark that architect's duty is to build pictures, not draw them, and that beyond a certain ount of South Kennington "freehand and del drawing," draughtsmanship is useless to e architect, however ornamental it may be. regards these objections, I would observe at, however magnificent a man's conception y be, they are necessarily and absolutely ited by the skill he possesses in expressing em. Of course, if a man feels that he will ver stand in need of any particular skill in pression, there is no necessity for acquiring I contend for the necessity of artistic ll in draughtsmanship for the reason indi-ed above, and also as a means—the means all others—of education. As regards this, I er, first, to the necessity of sketching from and new examples, both in perspective and measured drawings. How many times has s necessity been insisted upon by the great n of our art in lecture after lecture, printed l spoken? A good and careful sketch is rth more to the author of it than a week's otography, and a fortnight spent in drawing l measuring more than a whole winter's dy of books. Let all sketches be as good as know how to make them, regardless of the e spent in their production. Speed will ne in due time of its own accord. Express nuch as possible in as few strokes as possible. you are sketching architecture for strictly ucational purposes, put in all the detail the wing will hold, regardless of effect. Never nd whether it looks pretty or not. I need rcely refer to such well-known examples the sketches of Mr. Gerald Horsley Mr. Sydney Mitchell as instances of at I mean. Secondly, there is another way which the practice and power of drawing colouring are valuable as education, and I think generally much undervalued. "I nt," said William Hunt, in answer to the vy, "I paint—to learn." The navvy replied, hat was all he would rather break stones. ry sketch from nature honestly and care-y made is a lesson in the perception and ression of beauty from the greatest of hers. Therefore, let the student who feels can gain from such work, by all means e every opportunity of doing it. If he does feel he can gain aught therefrom, he had er leave it alone. It should always be e in mind that nature is the storehouse of beauty, and the source of all inspiration, that from thence, and thence only, can the gner gain materials for the creation of truly utiful forms. How can he design a har-ious scheme of colour for a room, or pave-t, who has never educated his taste by ying the ever-present harmonies of colour all round him? But whatever else the student may or may not do, there is one absolute essential, without which all study is useless, and with which there is much study that is rendered superfluous. I mean the faculty of observation—"the daily and hourly habit of comparing what we see in nature, and the thinking of how it should be represented in art; the constant observation of great things and small, and the experience that springs from it." If the student forgets every other hint I have tried, imperfectly enough, to set before him in the foregoing pages, let him at least remember this concluding one, simple as it may sound, "Never let anything pass him."

SECOND PAPER.

HINTS ON ARCHITECTURAL DRAUGHTSMANSHIP.

The acquirement of freehand drawing is the foundation of all good draughtsmanship; therefore architectural students cannot do better than follow the subject thoroughly, as it will be found to amply repay hereafter for any time that may be bestowed on the same. Without its aid expert draughtsmanship cannot be attained; by its means the eye may be trained to see correctly and the hand to follow readily the dictates of the eye. The most approved course to take in sketching is to commence with figure sculpture and plant forms, &c. When some degree of proficiency has been attained thus far, the student might extend his range, and seek some interesting example of ancient architecture, confining himself in the first instance to details, and gradually extending to groups of buildings. Having now explained what might be designated as the introduction, I will proceed to deal with architectural drawing proper, and in doing so I will divide it into four distinct classes (dealing with each class separately)—viz., (1) Geometrical drawings, as plans, elevations, and sections (working drawings coming under this class); (2) perspectives, including coloured perspectives; (3) etchings; (4) line drawings, competition drawings coming under this class. Beginning with the first-class, the chief characteristic of a good set of working or contract drawings is that they must be clear and intelligible. There should be as near an approach as possible to mathematical accuracy, figured and measured scale dimensions in strict accord, the lines fine, to enable measurements to be taken off accurately, the various materials to be indicated by corresponding tints, somewhat lightly laid on; these being essentially practical business drawings, clearness and accuracy will be of the first importance. The plans will not be complete without a good deal of explanatory lettering and figuring, which should be clear and distinct, so that any ordinary workman can understand them. Elevations should never be elaborately coloured; pictorial effects must be left for perspectives. The practice of leaving a slight interval of white paper between the corner of a building or projection upon which the light comes and the tint, is a good one, as it brightens up a drawing. It is extremely necessary that the draughtsman should be provided with a really good set of instruments, and that the drawing paper should not only be of good quality, but should be properly stretched on the boards. For general purposes, Whatman's unpressed double elephant drawing paper may be considered best. The pencils should be H or HH, according to scale of drawings. Tee and set squares are best made of pear wood. Vulcanised indiarubber should never be used, except for cleaning up, as it rubs up and ruins the paper; the ordinary bottle indiarubber is best. Of course, good square boards are indispensable for good drawing. Good Indian ink should be used, that which will not run when colour is applied; the same should be mixed frequently in small quantities and used fresh. It would perhaps be as well now to say a few words as to method of procedure in the designing of a building. As soon as the principal floor has been outlined, and the general arrangement determined, the basement and upper plans may be taken in hand, and carried on sufficiently far to set all doubts at rest as to the practicability of the arrangement of the whole scheme. In like manner the sections and elevations should proceed as far as possible together. It is a very common mistake to endeavour to finish one drawing, say, the elevation or the ground plan, before beginning the others. This method is a very unsatisfactory one, and inevitably leads to much vexatious undoing and redoing of work. Nothing should be inked in until the whole of the drawings are complete in pencil, and it is seen that each drawing thoroughly fits each other in every respect, and that there will not be the slightest alteration necessary. When this stage is arrived at the drawings must be examined carefully, and if considered incapable of further improvement, the inking-in with a clear, fine line might be proceeded with. There is nothing that will give the students better practice in inking-in than making a few sets of drawings of existing buildings; of course, to be plotted down accurately, and executed with all possible care, also he might consult such works as the "Moniteur des Architectes," or the "Revue Générale de l'Architecture," by so doing he will be enabled to form some idea as to what really good architectural draughtsmanship consists of. (2) Perspectives.—The first essential is to obtain a complete knowledge of the principles, really very few and simple; unless this is done at first, mistakes will be of constant recurrence. We are sadly deficient in number of books on perspective useful to architectural draughtsmen. Supposing the student to have mastered the rudimentary principles, he must not rest satisfied with the power of applying the rules practically to the extent of being able to put an ordinary building in perspective under the supposition that he has acquired all that is necessary; after he has done with the books and obtained from them all he can, he has yet much to learn before he can consider himself thoroughly qualified in the art. The careful examination of the actual appearance of buildings, as seen from different points of view, will teach more of real perspectives than any number of books, however learned; moreover, by this means, if properly carried out, the students may acquire the really valuable art of seeing mentally, as it were, in perspective the effect of his design when only in the form of geometrical plans and elevations; it will further enable him to make eye perspectives—that is, freehand perspective sketches of his designs. Coloured Perspectives.—These must be an affair of colour and shadow, no lines appearing. It is not a question of technical drawing as in constructional architectural plans; it is, in short, a picture—a water-colour drawing. In perspectives the general effect is the chief consideration, the details being quite a matter of secondary importance; too many lines should not appear, as in the process of colouring these get partially obliterated. The paper for a coloured perspective should be of a slightly rougher texture than that used for ordinary drawings, and should be exceedingly well stretched, else buckling-up will be the consequence. The outline must be drawn with a pencil, not unduly hard, so as not to necessitate digging into the surface of the paper; in damping the paper previously to commencing the colouring, it is best to slant the board and pour water gently over it; this done, allow the boards to stand on end for it to drain off. Cake colours are preferable to moist, as the latter are liable to get dirty. Colour brushes should be of best sable. (3) Etchings.—Etching is done by getting all the effects of a drawing by shadows indicated by short, rapid touches of the pen, therefore differing very widely from line-drawing; the lines should not be drawn with a mathematical drawing pen, the hand and ordinary pen should be used. The fault of most etchings is that there is too much work in them, and at a short distance they appear as one confused mass, exaggerated shadows, distance, sky, and foreground all alike in intensity. Curves should be done by hand. (4) Line Drawings.—In drawings of this kind the architectural lines, that is, all corners, angles, &c., as distinguished from the indications of shadows, must be drawn in a clear, distinct, though occasionally broken line, which should be rather fine than otherwise; the less shading the better. In competition drawings special attention should be given to making the leading arrangements obvious and unmistakable, omitting minute detail. The walls on plans and sections are better inked in with Indian ink than coloured. The explanatory writing, lettering, and figuring should be large, bold, and legible.

CHAS. T. TAYLOR.

WAYSIDE NOTES.

THE holiday season may now be said to have commenced, and in fine, genial weather—a very important consideration with the sketcher, who should endeavour to make the most of the long, rainless days—the earnest student, if he be not daunted by a burning sun, will find that he can accomplish a vast amount of work about this time of year, when he can sketch and measure from cock-crow to nightfall. Those who study in the hottest and brightest days of summer, however, will find a good purpose-made umbrella a prominent necessity, and it is, therefore, an article that should not be forgotten by those who intend to occupy themselves chiefly with systematic sketching. A solid member of the family of campstools, also, adds greatly to comfort in working. It is perhaps best to frankly recognise its importance by arming oneself with a really serviceable article, and avoiding those combination instruments which alternately serve the purpose of a seat, a walking-stick, and a weapon with which to overawe the too-inquisitive foreign *gamins*. One often meets, however, with individuals who would seem to possess legs with muscles like unto those of the stork or pelican in powers of endurance, and who can, therefore, sketch almost as well standing as sitting. Personally, it must be confessed, I never could do much drawing without a good seat, especially whilst engaged with the highly-colouring department of the business. A handy moss-covered bank, canal wall-coping or other natural, if primitive, seat, greatly assists us in determining the "position of spectator" in our perspective sketches.

A very large relative portion of travellers (especially on the Continent) must be composed of architects and artists. A genuine love of old architecture naturally creates a keen desire for travel. Now that railway and boat-fares are relatively so small an item in one's expenses, there is little excuse for those, of even moderate means, not taking advantage of every opportunity to improve themselves by more or less extended travel. There are two distinct benefits to be derived from a habit of touring—an increased knowledge of the artistic side of one's business, and a certain polish of manner that comes to the person who moves freely about in the world, and the acquisition of which is no mean advantage to a man in the struggle for existence. Seeing this, it is absolutely necessary to decide exactly what our object in travelling is before setting out, and also to consider whether we go for the purpose of seeing as much as possible of a certain town or district, or whether we are only to carefully study a few of its buildings; whether we are to see "life" or study architecture; whether, again, we have to follow a prearranged route, or be guided solely by the inclination of the moment. It is infinitely better, as a rule, to decide definitely on the towns, &c., that we are to visit on the way, and to stick to this decision through thick and thin. At any rate, carefully avoid aimless and purposeless wandering. The former method of procedure is based on the soundest moral principles, whilst the latter will inevitably lead the tourist into a state of bewilderment and uncertainty, and every little wayside incident will cause him to alter his course with the rapidity and variableness of the most fickle weather-cock.

Judging by the frequency with which designs with a more or less pronounced flavour of Flemish architecture appear in competition and ordinary business work, it would appear that one of the most profitable districts to visit, for the purpose of sketching, is that stretch of flat or gently undulating land known as the Low Countries. In the Imperial Institute competition there was more than a flavour of this style in the successful design, and one competitor's exhibit was wholly founded on the style of Mediæval Flanders. Indeed, the influence of old Dutch and Belgian architecture on our modern English work has of late years been very pronounced. And there is certainly a vast storehouse of picturesque architecture in Belgium and Holland, which every architect could become acquainted with advantageously. The Dutch style, however, must be studied with extreme caution, as there are many features in its detail that are most undesirable as examples for imitation. Much of the typical ornament is in the worst rococo taste. The student should endeavour to mentally pass all work he may come across through a purifying fire of much thought and severe criticism, to reduce all to a standard of beautiful design and constructional truth, rejecting, as so much dross, all debased and worthless forms, such as the unarchitectural, snake-like scrolls in gables and towers, of which the Dutch builders were so fond. The old architecture of the Low Countries is eminently *suggestive*, especially as regards outline and composition of the picturesque order; but much of the detail is so objectionable that there are few buildings that could safely be copied in a literal manner.

Companionship in travelling is most desirable where of a harmonious nature. Unfortunately, it is rarely that two professionals are sympathetic enough to agree on every question, and mutually forbearing enough to sink differences of opinion for the common weal. Where a young architect cannot secure a companion with whom he is likely to agree, he had a thousand times better go alone. For many, however, the most satisfactory way of spending a sketching tour would be to join the Architectural Association Annual Excursion. Those who accompany the A.A. this year should have a very pleasant tour when the time comes. Bath and its neighbourhood are rich in old work, which will well repay study. By joining the A.A. tour members obtain many more chances of seeing new places of interest than when they are travelling by themselves, as facilities are given to the body to visit private domains that could with difficulty be obtained by the *voyageur tout seul*.

The result of the last BUILDING NEWS prize competition was but as most of us must have expected. In judging of the merits of architects who have risen to eminence, it would be as well to recognise the curious fact that everyone has a more or less marked mannerism. We find that there are men who go "mad" on proportion, whilst others rely solely on the beauty and originality of their detail for effect, and others, again, on the harmonious disposition of mass; but they often carry each quality to excess. Many an architect whose design is of merit in respect to one only of the many necessary qualities of architecture rises in our estimation; but the great man is he who attends to all the points, and especially to the noblest attributes of well-building. Such persons have generally grasped the *principles* of design in architecture, and while possessing great technical skill, they wisely subordinate this interesting accomplishment to the unalterable laws of beauty and fitness.

There is such a fascination about this technical excellence in design that at times we may be led to neglect the just claims of the *laws* of good composition. Thus there are many noteworthy architects who, but for the halo of "architecturalism" they throw over their work, would habitually produce the most hideous architectural deformities—judged by the rules of design. But this great skill in the treatment of debased styles must be looked upon rather as a *tour de force* in design, and is akin to practical joking in draughtsmanship. Still, we most of us prefer to see the real artist "running amuck," than the person without artistic power designing by pure and irreproachable rule. But it must be constantly borne in mind that excessive technical skill has ever caused the downfall of all true styles. As the individual ascends so the style of the multitude descends. In the old times the individual appears to have been secondary in importance to the community—all worked with a common aim—the well-being of their particular style. The old builders worked on *principles*, and unless we, also, inquire deeply into the laws of design, and work on fixed and true principles, we shall find that all our knowledge of *style* is only as a vast unwieldy hulk, that we have not the power of safely steering through the many shoals and sandbanks of artistic delusions. We are drifted about by the winds and waves of circumstance and fashion, till our hopes are finally wrecked on one of the many unseen rocks that lie just beneath the surface in the navigable course of the unprincipled.

GOTH.

ADMISSIONS TO ARCHITECTURAL SCHOOL.

ROYAL ACADEMY, JULY, 1877.

UPPER SCHOOL.—P. Anderson, S. H. Barnsley, W. H. Boney, H. P. B. Bowning, C. Gill, P. M. Ginham, G. Harvey, G. F. McCombie, F. W. Marks, F. Masey, G. W. Nicolay, A. Sykes, A. Tayler.

LOWER SCHOOL.—H. Baker, G. E. Collins, R. E. Draper, E. E. Fetch, A. L. Giles, W. Grace, W. F. Horton, A. J. Inman, G. R. Jaques, L. Martin, H. Mathewman, C. H. Norton, E. E. Poole, A. H. Powell, A. Pywell, R. W. Sampson, W. Taylor, A. Thompson, A. G. Veal, F. J. Verity.

PROBATIONERS.—A. E. Bartlett, W. B. Clarkson, A. F. Faulkner, L. Frazer, A. G. Haslilow, E. A. Hawkins, H. G. Ibberson, H. C. Rogers.

CHIPS.

The tower and spire of St. Lawrence Jewry, E.C., are now undergoing restoration. Mr. Young is the architect, and Messrs. Dove Brothers, of Islington and Tokenhouse-buildings, are the contractors.

Sir Lionel Pilkington has presented to the Local Board of Sandal, near Leeds, the ruins of the ancient Castle of Sandal, and the grounds adjacent thereto—containing the site of one of the battles fought in 1460, during the Wars of the Roses—as a site for a public park.

At the annual meeting of the Midland Union of Natural History Societies, held last week at Malvern, the Darwin Medal, which is this year set apart for archæology, was awarded to Mr. Edward W. Badger, M.A., of King Edward's High School, Birmingham, for his paper on "The Monumental Brasses of Warwickshire."

Mr. Thomas Alexander, C.E., Glasgow, has been appointed Professor of Engineering, Dublin University. Mr. Alexander was for seven years Professor of Engineering at the Imperial College of Engineering, Tokio, Japan, and returned home at the end of last year. While in Japan he published conjointly with his colleague, Mr. Arthur W. Thomson, B.Sc., Glasgow, a work on "Applied Mechanics."

The foundation-stone of the new Church of Our Lady of the Assumption and the English Martyrs at Cambridge, was laid on the 30th ult. by the Bishop of Northampton. Among those present at the ceremony was Mrs. Lyne Stephens, at whose cost the church (in Early English style) and presbytery (in Tudor style) are being erected. The latter is entirely and the former half built, both from designs by Messrs. Dunn and Hansom, of Newcastle-on-Tyne.

A new church, dedicated to St. Peter, at Salesbury, near Blackburn, was consecrated last week. The new structure is of stone, and contains accommodation for 400 persons. It consists of nave and chancel, organ chamber, with clergy and choir vestries. It adjoins the old churchyard, and is built in the Late Fourteenth Century type of Gothic. The cost was about £3,950. The old building which it replaces was erected in 1808, and a few years ago was found so unsafe that services had to be conducted in the schools.

The Liverpool corporation have appointed Mr. W. A. Legg to superintend the construction of the Cotebrook reservoir and other works on the Vyrnwy water supply undertaking, at a salary of £250 per annum.

The town council of Grimsby have appointed Mr. Joseph Maughan, who has served the town as borough surveyor for the long period of 31 years, and now retires on account of advancing age, as consulting engineer and surveyor.

Lord Lyons recently laid the foundation-stone of a new church to be erected in the Rue des Bassins to replace the Marbeuf Church which was pulled down some years ago. The new church is, in honour of the Jubilee, to be called the Victoria Chapel.

At the annual meeting of the Dundee Institute of Architecture, Science, and Art, held on Thursday, the 7th inst., it was stated that the membership had increased from 159 to 192, and that the accounts showed a favourable balance of £19. It was mentioned that prizes would be given for the best drawings, etchings, photographs, modelling, carving, design for a wrought-iron bridge, and paper on building mortar.

The organ has been reopened in St. Stephen's Church, Willington, near Darlington, after extensive enlargement. Mr. Postill, of York, was the builder.

The parish church of West Heslington, near Scarborough, is about to be restored from plans by Mr. C. Hodgson Fowler, F.S.A., of Durham, at an estimated cost of about £1,300.

Mr. George Paton, C.E., of Glasgow, has been appointed Professor of Engineering at the Royal Agricultural College, Cirencester, in room of Mr. Arthur W. Thomson, resigned.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to T. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 10 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page Advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—C. and J. M.—P. R. W.—M. Bros.—B. L. Co.—A. W. K. and Co.—T. B. I. Co.—W. O. and Son.—T. T.—T. L. B.—H. J. B.—M. and Co.—Sir W. E.—B. of L.—S. L. B.—M. A.—J. B.

Correspondence.

ARCHITECTS AND THE REGISTRATION ACT.

To the Editor of the BUILDING NEWS.

SIR,—Mr. Farman's letter, with an extract from the *Morning Post*, may serve very well to give a little colour to the proposed Registration Act; but are there no counter indictments? I think so.

Names and dates are not always public property as in the case Mr. Farman cites. If they were I could give an instance in this town where an architect's blunder—I was going to say *ignorance*, but have adopted a more charitable word—caused the whole front of a warehouse to topple over into the street.

Amongst the thousands of buildings constantly in course of erection or alteration throughout the country we must always have a percentage of such accidents. The only wonder is that they are so few.

Mr. Farman's haste to avail himself of this instance is indicative of a weak cause. The fact that a plumber is the culprit in this case reminds me of the architectural quack's "signboard" quoted by one of your correspondents a month or two back. "Plumber, glazier and decorator, architect and surveyor," I think it ran. Well, Sir, if this versatile genius has been "in practice" since 1882, and the registrationists have their way, he will shortly be a certified architect. Which is better—a presumptuous plumber, *known as a plumber*, or a presumptuous plumber whom the law has dubbed "Sir Architect"?—I am, &c.,

INVICTA.

AN EXPLANATION WANTED.

SIR,—I guess "M.P.'s" is a day-work job!—I am, &c.,

BRITISH WORKMAN.

THE IMPERIAL INSTITUTE.

SIR,—From a letter by Mr. Jas. Pulham in your last issue, I gather that "a dome is recommended" instead of a tower to the Imperial Institute. Let me say that, if such is the case, I think it downright unfair to us. Why not adopt the balance of our design as well?—I am, &c.,

THOS. M. DEANE (T. N. Deane and Son).

3, Upper Merrion-street, Dublin, July 11.

ARCHITECTS IGNORED.

SIR,—At the Lincolnshire County Magistrates' meeting, held last Thursday, referring to an annuity proposed to be given to Dr. Palmer, medical superintendent at Bracebridge County Lunatic Asylum, which, by the way, was refused, Viscount Oxenbridge is reported to have said that "Dr. Palmer planned the asylum, which has been from time to time added to according to his plans and advice." No one would imagine for one moment that his lordship stated what he knew to be false, but the statement is certainly most extraordinary, and, if true, is (after 40 years' secrecy) a real "letting the cat out of the bag." The fact of the case is that the county magistrates advertised for plans, and the designs sent in by Messrs. Hamilton and Medland were approved and carried out. Now, if Dr. Palmer planned the asylum, he must have helped Messrs. Hamilton and Medland, and as the magistrates received assistance from Dr. Palmer in selecting the approved design, therefore Dr. Palmer advised the selection of his own plan. This was very unjust, and heavy handicapping of the unfortunate unsuccessful competitors, and it is to be feared that architects even nowadays often suffer under similar injustice. They are induced to expend their time, their money, and their knowledge by a promise or hope of remunerative success, when it is well known to those behind the scenes that a certain favoured individual will receive the fruition.—I am, &c.,

PALMAM QUI MERUIT FERAT.

NUMIDIAN MARBLE.

SIR,—Having executed the whole of the marble work of the National Gallery extension and grand staircase of the New Liberal Club, we beg to state that none of the materials used are from the quarries of the so-called "Numidian Marble Company, Limited," whose revised prospectus is now before the public, and in which they infer that these marbles are the produce of their quarries, when in reality they are shipped at ports 200 and 600 miles off respectively in North Africa, as concerns the National Gallery; the Liberal Club marbles being the products of Italy.—We are, &c.,

FARMER AND BRINDLEY.

67, Westminster Bridge-road, London, S.E., July 13.

THE PROPER THICKNESSES FOR WALLS OF DWELLING HOUSES.

SIR,—As regards health, security against fire, and stability, it is important that local authorities should prescribe and enforce reasonably stringent by-laws as to the above matter. The question is one upon which there is much diversity of opinion, and thereupon much variation in practice. If you will permit me, Mr. Editor, I will ask the questions:—

1. What are the proper thicknesses for external and party-walls of dwelling-houses varying from 20ft. to 50ft. in height?

2. Ought the same rule to apply to cottage houses which would let for £15 per annum, as to houses at rents varying from £30 to £300 per annum?

To illustrate what I have said as to the variance, from any definite rule which exists in practice, it is only needful to point to the cases of those districts which have adopted the model by-laws of the Local Government Board and that of the City of Manchester.

In the former case, a small house with a basement, ground floor, and chamber floor, having walls 28ft. to 30ft. high; because the walls exceed 25ft. in height, and comprise more than two stories, the external and party walls of the basement and ground stories must be 13½in. thick, and the rest 9in. thick. For twenty years hundreds of similar houses have been erected annually at Manchester, with external walls 9in. instead of 13½in. thick, and party-walls 4½in. instead of 13½in. thick! Still they stand, and owing to the comparatively slight risks of fire in dwelling houses, I am not aware that many fires have extended from house to house *through* the very slight party-walls erected. According to metropolitan ideas, I have no doubt the above comparison may cause some little amazement and perhaps ridicule. There is, however, no fiction stranger than fact. No architect building a substantial villa at a cost of £600 or £800 for a client who could afford the outlay would hesitate much about voluntarily adopting the thickness prescribed by the Local Government Board, as based upon the Metropolitan Building Act; but any ordinary capitalist thinking of investing his money in dwelling for the working classes in most of our Northern towns would hesitate. Is there no middle course? Sanitary, like other reforms, must of necessity be accomplished gradually. Public opinion is incapable of suddenly rushing from one extreme to another. Is not progress being prevented instead of being encouraged?—I am, &c.,

A CONSTANT READER.

Manchester, July 9.

ARCHITECTS AND QUANTITY SURVEYORS.

SIR,—It is rather amusing to read the letters of your correspondent "C. F. M." He states that the architect should do such "surveyor's work" as cannot be properly done by a quantity surveyor "pure and simple." I, for one, should very much like to hear "C. F. M.'s" explanation of this. The quantity surveyor, "pure and simple," is required by the Surveyors' Institution to undergo a very crucial examination, not only in quantities, measuring, and valuing artificer's work, but also in land surveying, constructive working drawings, composition of stones, limes, and cements, law relating to easements (light and air), fixtures and dilapidations, and, further, as a preliminary requirement, to measure up a building of a given extent, and prepare a decent set of drawings to a small scale. What, then, is the "surveyor's work" that should be done by the "architect" on account of the quantity surveyor's inability?—I am, &c.,

QUANTITIES.

ORDNANCE SURVEY.

SIR,—From practical experience, I am sorry to say, I can fully endorse the statements made by your correspondent the other week. The Ordnance Survey carried out on its present scale means simply ruination to a large body of professional men, without the slightest compensation whatever, and with no commensurate advantages to the country at large. There are cases, to my knowledge, of respectable country surveyors, with whom large premiums have been paid, and who have been perhaps years in perfecting themselves in their profession—in which it takes as much time as in any other profession to become an adept—being brought to the verge of starvation after enjoying incomes of £250 to £500 a year, and for whose benefit? For the country's? No! But for the rich landowners', railway directors', colliery proprietors', who make the laws for themselves, and who doubtless caused the Ordnance Survey to be published on the 1-2,500 scale to save their own pockets. The publication on this scale is unjust and unwarrantable, destroying, as it does, a respectable profession. And there is in many cases no return for it. Any Ordnance map agent will say that there are not half a dozen sheets of certain country districts sold, say at 2s. 6d. each, whereas the expenditure on such sheets must cost the country £1,000. Besides this they are too large and unwieldy for military and strategical purposes, and, what is not generally known, are altogether inaccurate and unreliable as indications of boundaries of private property, the areas being given to centres of hedges and not to ditches, causing, in many cases, great discrepancies, and paving the way for disputes and expensive law-suits. The Survey of Yorkshire on 6in. to a mile, with contours, some years ago, was a really excellent production, quite large enough for military and public purposes, and useful alike to the private surveyors and the public, and did not interfere with private practice; and it would be as well had the authorities confined themselves to that scale for other counties, without attempting to compete with

local land surveyors in the larger scale plans, which are a signal failure as records of private property, although recognised, I am sorry to say, by county court judges and lawyers, who cannot understand the merits of the case.

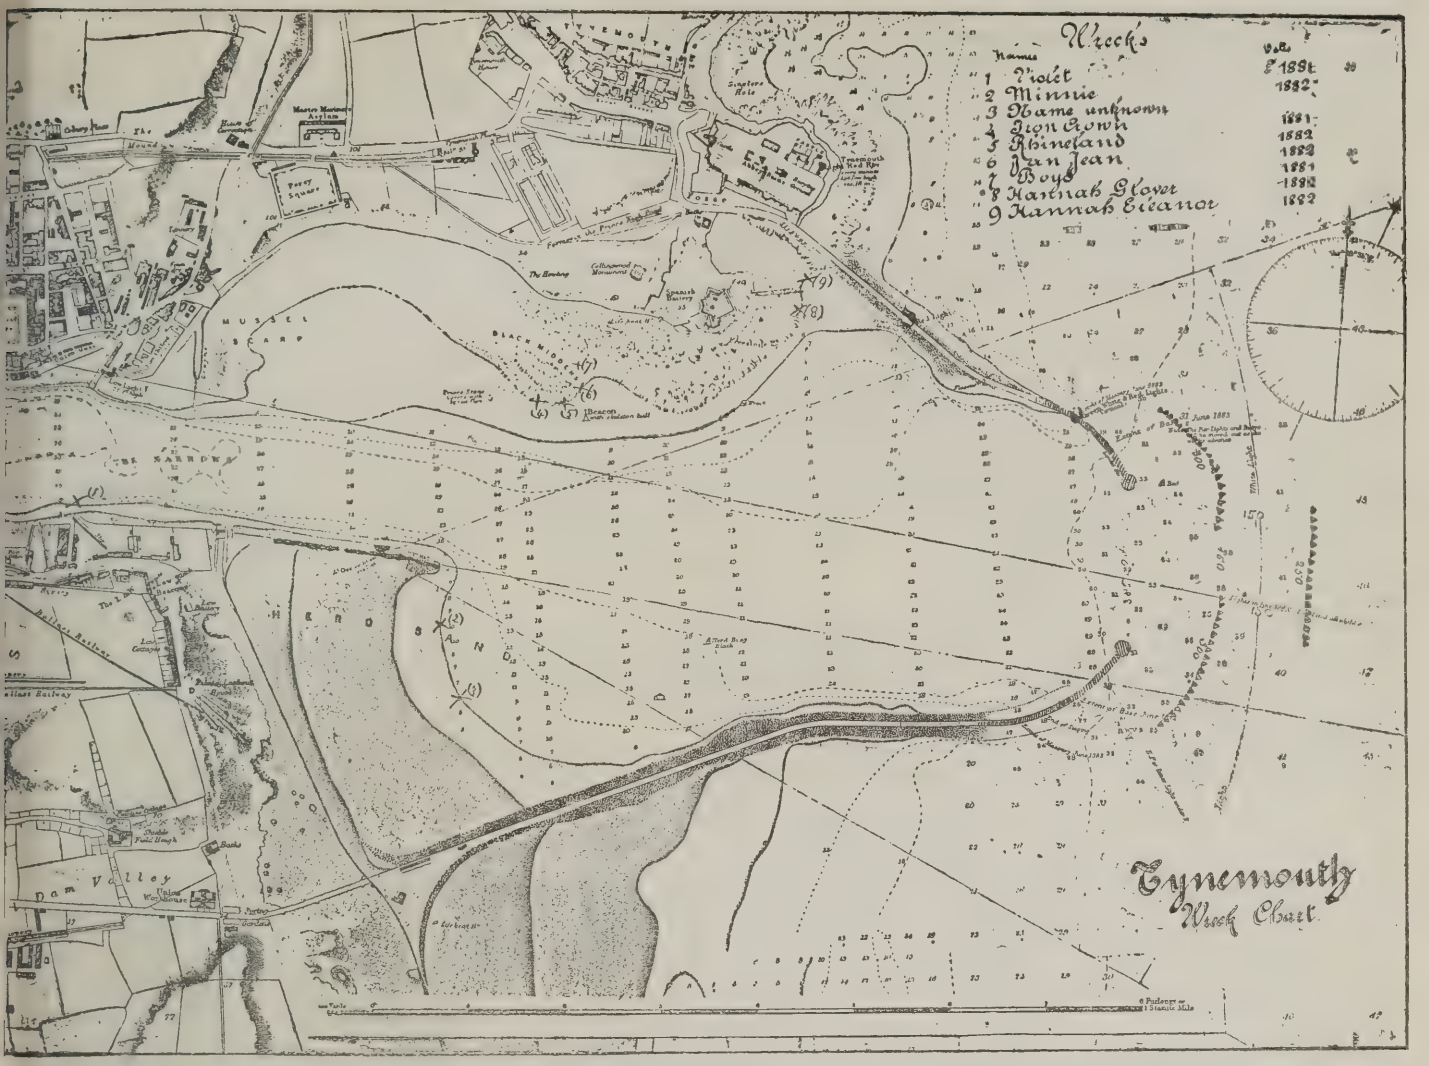
With regard to the town surveys on 10ft. to the mile scale, I believe it is a fact that certain corporations and boards have subsidised the Ordnance Department to complete the surveys of their districts, in some cases at a cost of several thousand pounds to the ratepayers, whereas local surveyors could have been found to undertake the work at less cost, the ordinary borough engineer and surveyor and his staff not having in the majority of cases the experience necessary to undertake surveys on any large scale.—I am, &c., A Sufferer.

WAVE BASINS.

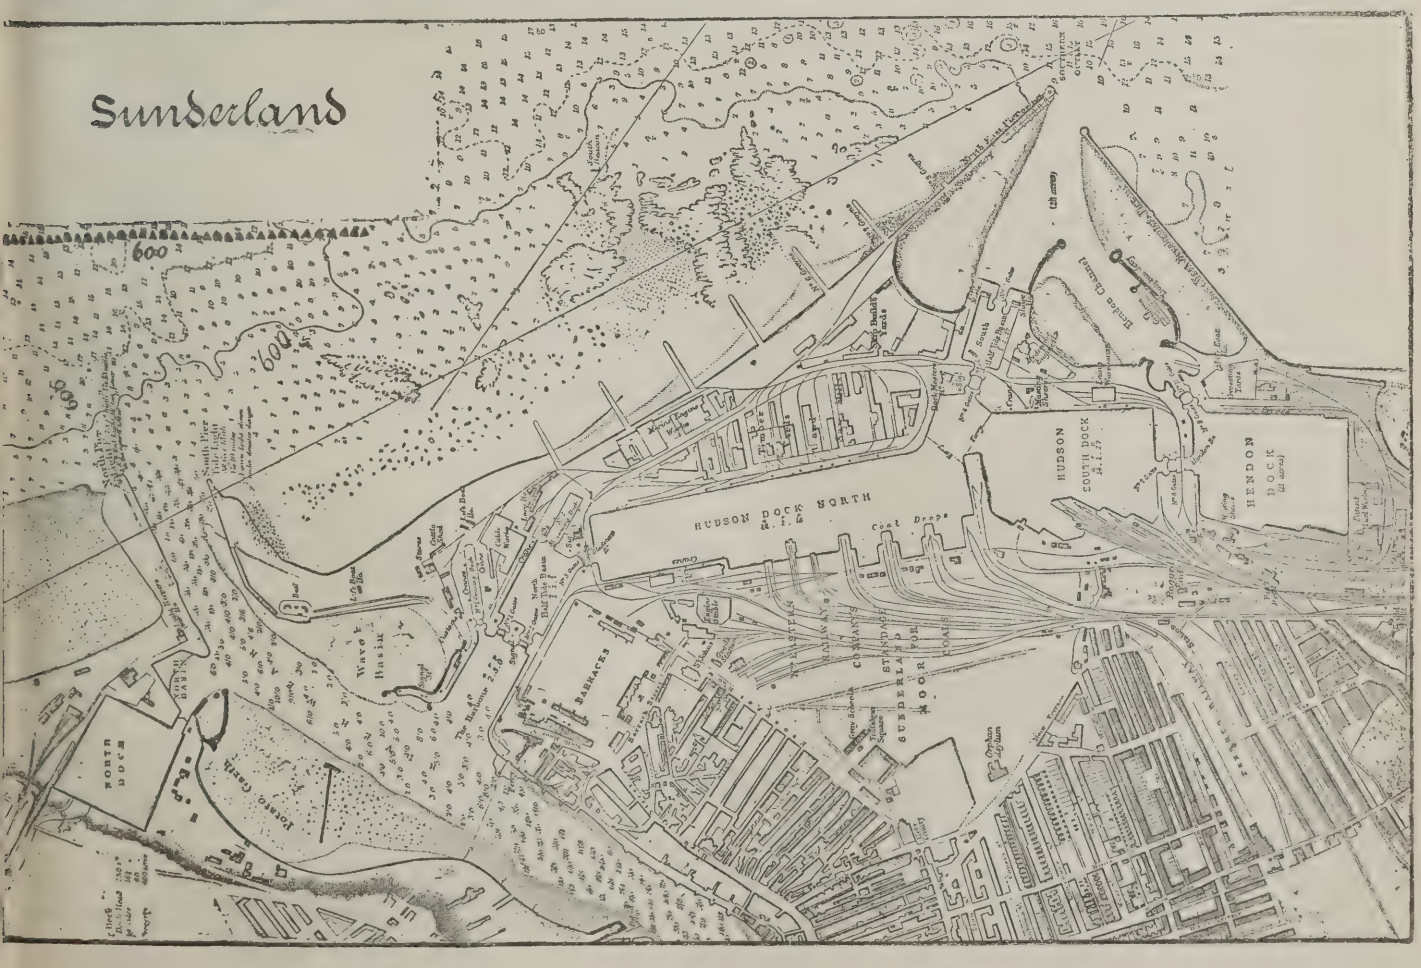
Sir,—The important subject of rough water inside harbours, and the use of wave basins has been recently referred to in your journal. Without denying that, under certain circumstances, recourse to them may be justifiable, there seems to me so much to be said against them, that I trust you will permit a few words of protest.

Are wave basins things for an engineer to plume himself upon? Are they not usually a confession of failure; an admission that the original design for the harbour has not produced the expected result?

There are three large harbours on the east coast which have tried wave basins, and illustrate this question in the best of all ways—viz., experimentally. A study of these and almost every other port that occasionally has the wind setting right into it, is most instructive. The wrecks and damage to solid works that result from the range of the sea within harbours, and which are repeated from year to year, show conclusively that the present description of harbour works at whatever cost, are insufficient. Look at the three ports, Aberdeen, Tynemouth, and Sunderland. In each case the established plan of two training walls has been adopted; but in each case, after very heavy expenditure, it is found that these and the other improvements of dredging and deepening the river simply result in waves occasionally travelling into the harbour with greater depth and force, and to a greater distance up the river than before any works were constructed. The "range of the sea" within harbours has become quite a hackneyed expression, a state of things that we have become accustomed to and devise new works to meet. The original estimate purports to create a port by running out two long solid piers into the sea; but supplemental estimates have afterwards to be sanctioned to remedy a new condition of affairs that these works have brought about. Wave traps and wave basins endeavour to reduce the evil that results from training walls, which, while they usefully confine the outgoing flow of a river, also confine and direct with concentrated force the incoming destructive power of waves.



At Aberdeen, despite four wave traps on the north side, and three on the south, the water well inside the harbour is dangerously agitated with certain directions of the wind. At Tynemouth, though £7,000,000 have been spent on the river and its entrance, and there is a wave basin on both north and south sides, the first mile within the piers is still confessedly unsheltered, unreclaimed from the state of the neighbouring ocean in an easterly gale. All vessels that succeed in entering through the stormy water at the pier-heads have to run miles up the river before they really find shelter. Numerous wrecks within a mile of the pier heads show how imperfect is the shelter afforded, and docks at North and South Shields formerly "on the Tyne," are now said, from the wave disturbance felt there, to be "on the German Ocean." At Sunderland similarly, at one entrance ships have to run up the river, at the other into docks. In the north harbour there are four wave traps on the north side, and two on the south; and in the south harbour there are four wave traps on the north, and five on the south side—in all, fifteen wave traps. In fact, what should be a sheltered harbour and anchorage within those long and costly piers is found to be still so much at the mercy of the waves that this inclosed space, instead of containing shipping, is thus filled up with inner piers called wave traps, four deep, in the hopes of, in some degree, checking the force of the waves as they advance up the harbour, and are obstructed and turned by one pier after another. Almost the whole area, that is, properly speaking, the harbour, is given up to piers and waves that it is hoped will there expand and expend themselves—as primitive and clumsy a device as it is costly. As well might an engineer who has constructed a noble span for a town-hall or a railway station proceed forthwith to occupy three-fourths of the space with walls and pillars. So inefficient is this system found, that over and above all this fruitless and vast expenditure on four outer piers and fifteen inner ones, Sunderland may now be said to be commencing de novo, for, at an expense that will be little short of one quarter of a million, she is providing herself with a new harbour, entirely outside the present works at the entrance to the river, and on so generous a scale as to allow waves also their space wherein to have their own sweet way, and, mayhap, leave the rest of the inclosed area quiet for the use of vessels. What is wanted is that a vessel passing through the heads should find itself in shelter and in comparatively clear water. Stormy water should not be allowed to enter the harbour. But this is not all; violent waves outside and at the entrance to a port are a great inconvenience, and the cause of many wrecks. Wave power needs to be checked both inside and outside a port. Inside wave basins do it in a partial and costly way—costly both in money and in the area of the harbour that is sacrificed to them, leaving but a narrow passage in the middle for ships, say one quarter of the whole inclosed area. But at the entrance nothing is attempted. If waves can be robbed of their powers outside the entrance, then both objects are attained at once. If wave basins and every other expedient that has been attempted are found both costly and imperfect, is it not time the patient ratepayers and shipowners insisted on engineers turning their attention in some other direction, and devising something more effectual, more certain, and less costly?



The remedy seems to be ready to hand, and has been known for centuries to every sailor who has found shelter behind floating ice or seaweed. A floating structure appears to be the only thing that can successfully be employed for checking the force of the sea at the entrance of and within a harbour. It will interfere with no currents, check no scour, and cause no deposit, and it can be so placed as not to narrow the entrance and incommode vessels desiring ingress or egress in any direction. It can also be shifted in position, and thus a mistake corrected—an impossibility in solid works.—I am, &c., E. C. Greenway Thomas.

65, Cornhill, July 9.

DRAINAGE AND SANITARY FITTINGS.

Sir,—When I wrote the letter that appeared in your issue of June 24th I had no intention of encroaching further on your space; but I beg leave to correct a deliberate misstatement

as published in Mr. Buchan's letter on p. 52. Under the section of a common branch pipe are the following words:—"Buchan's 1877 and Bruce's 1885 round opening or eye B." This statement is intended to convey a claim by me, but it is only a deliberately-manufactured statement made by Mr. Buchan to suit his own style of writing. In one of my specifications there is shown and described a metal gas and water tight cover for inspection eyes, made square, oblong, or round. This may show some of your readers the value of Mr. Buchan's "asserted" facts and drawings; and it is amusing to see the drawings which Mr. Buchan has made of Shoebridge's 1853 access pipes to suit his own statements.

I can afford to pass by the remarks about my 1885 trap, as no statement from Mr. Buchan will remove the fact of this trap being self-clearing, with 1in. of deeper seal than any trap that Mr. Buchan has been able to produce in fireclay or metal—when Buchan's and Bruce's traps are flushed with the same quantity of water. It is a matter of no importance what depth of seal Mr. Buchan may describe on paper when he has not been able to construct a clean working trap with a good deep seal.

Mr. Buchan informs the public what his lawyers may do, and as they have made an attack on Messrs. Robert Brown and Son, Sanitary Fireclay Works, Paisley, the present manufacturers of my 1885 trap, I beg to inform Mr. Buchan that this trap will be made and supplied to the public on my responsibility until Mr. Buchan can make good a case of infringement against me. This threat is more clear evidence showing how very inconsistent Mr. Buchan is when he describes in detail the construction of my 1885 trap as "nonsensical" and "ridiculous."

On p. 53, Mr. Buchan treats your readers to a plan showing the drawings of Armadale Castle, for Lord Macdonald of the Isles. I have carefully examined this plan, and I safely state, without fear of contradiction from anyone (except Mr. Buchan) who fully understands good drainage, that the plan shows a great want of knowledge, and ignorance of the most essential principles of improved sanitary arrangements. The position of the manholes shows that Mr. Buchan does not realise the proper use of a manhole; and there are no manholes shown on the principal branch drains at their junction with the main drains at front and back of house, and, according to the plan and description, many of the branch drains are not ventilated, in some parts to the extent of 20ft., without any ventilation behind the traps.

It is a great curiosity to see the number of "Buchan" traps indicated and described on the plan, and the idea of curved and crooked drains with branch connections below the floors, without any means of access at the branches, is perfectly absurd, showing the want of ordinary ability. It would be interesting to know how Mr. Buchan formed the joints of the curved drains, which he has shown drawn to about a radius of 12ft.?

It does not require an expert in sanitary matters to see that this plan, or what is termed "Buchan's sectional system of house drainage," will not pass muster in this Jubilee year as improved drainage. It is much more like some old plan of fifty years ago.

Although this system of drainage is badly arranged, badly ventilated, and overstocked with Buchan traps, &c., according to the plan and description, it is pleasing to learn that Mr. Buchan used *fireclay drain pipes*, and not iron pipes, at Armadale Castle.—I am, &c.,

William Bruce.

1, Sciennes Hill-place, Edinburgh.

THE NUISANCE FROM SEWER VENTILATORS.

Sir,—So far as can be judged from his letter on p. 52, it appears to me that Mr. R. H. Reeves draws important conclusions from rather curious premises. He refers to an "offensive" street sewer grating which had "a brick ventilating-pipe" under it running below the road some 30ft., and then up a house wall to half-way up the chimney.

Now, if this street grating had no water-trap below it, how could it be expected that the offensive smell in the sewer should stop coming out at it, even although there was a so-called ventilating-pipe put in, as stated, below the grating? If it were trapped, there must have been something faulty, or else how could the bad smell get out?

Then, was the "brick" ventilating-pipe carried up the wall, or was the vertical portion iron, and not brick? If iron, what size? And is it not nearly choked at foot by falling rust, owing to not being red-leaded or coated inside?

Further, if it was desired that this sewer ventilating-pipe should act efficiently as a ventilator for the sewer, why was its outlet not carried up to above the chimney cans several feet, and surmounted by a good fixed exhaust ventilator, instead of the outlet stopping at "half-way up the chimney"?

So far as I can judge at present from Mr. Reeves' letter, he has no sufficient reason, under the circumstances, for writing about the "utter uselessness of stack-pipes as a means of ventilation to sewers." In my opinion, stack-pipes—but rightly connected and properly put up—will be much more used in the future than they are as yet.—I am, &c.,

W. P. Buchan.

CHIPS.

A bridge of 1,600 tons weight, spanning the Pennypack, at the Homesburg Junction of the Pennsylvania Railway, was, on June 26, moved a distance of 50ft., by engineering skill, within 11½ minutes. Only 32 men were engaged in the operation.

On Wednesday week, the ceremony of formally opening the new Hull and Sculcoates Dispensary, situated in Baker-street, Hull, took place. The building is of Flemish Renaissance character, from designs by Messrs. Botterill, Son, and Bilson, architects, Hull, and includes a dispensary and residence for house surgeon.

Mr. John Rowe, of Mayflower-road, Clapham, shot himself on Friday through the head with a revolver. The deceased was a builder on an extensive scale, and had recently called together a private meeting of his creditors, the liabilities being estimated at over £30,000.

The Queen's Bench decided on Friday that the Institute of Civil Engineers was liable to pay a duty of five per cent. upon its annual income or profits, as it was established for the promotion of a particular branch of knowledge, and was not devoted to the promotion of education, literature, science, or the fine arts, which would have entitled it to exemption.

The Glasgow District Lunacy Board have disallowed the claims of £1,448 by Mr. Dansken, measurer, and £3,400 by Messrs. Bruce and Hay, architects, on account of professional work done in connection with the Hartwood Asylum up to the present time, and decided on Friday to call in professional advice as to the matter.

A new church in connection with the Church of Scotland has just been opened for worship at Corrie, in the Island of Arran. The new church is in the Early Gothic style, built of red sandstone, having a simple stone belfry and wooden porch, the roof being covered with green slates. Internally, the church has a nave with single aisle and chancel, the nave and aisle being separated by three moulded wooden pillars supporting timber arches. Rush-bottomed chairs, accommodating 250 persons, take the place of pews. Messrs. Burnet, Son, and Campbell, Glasgow, are the architects.

The Bristol School Board have adopted plans by Messrs. Trew, of that city, for new industrial schools.

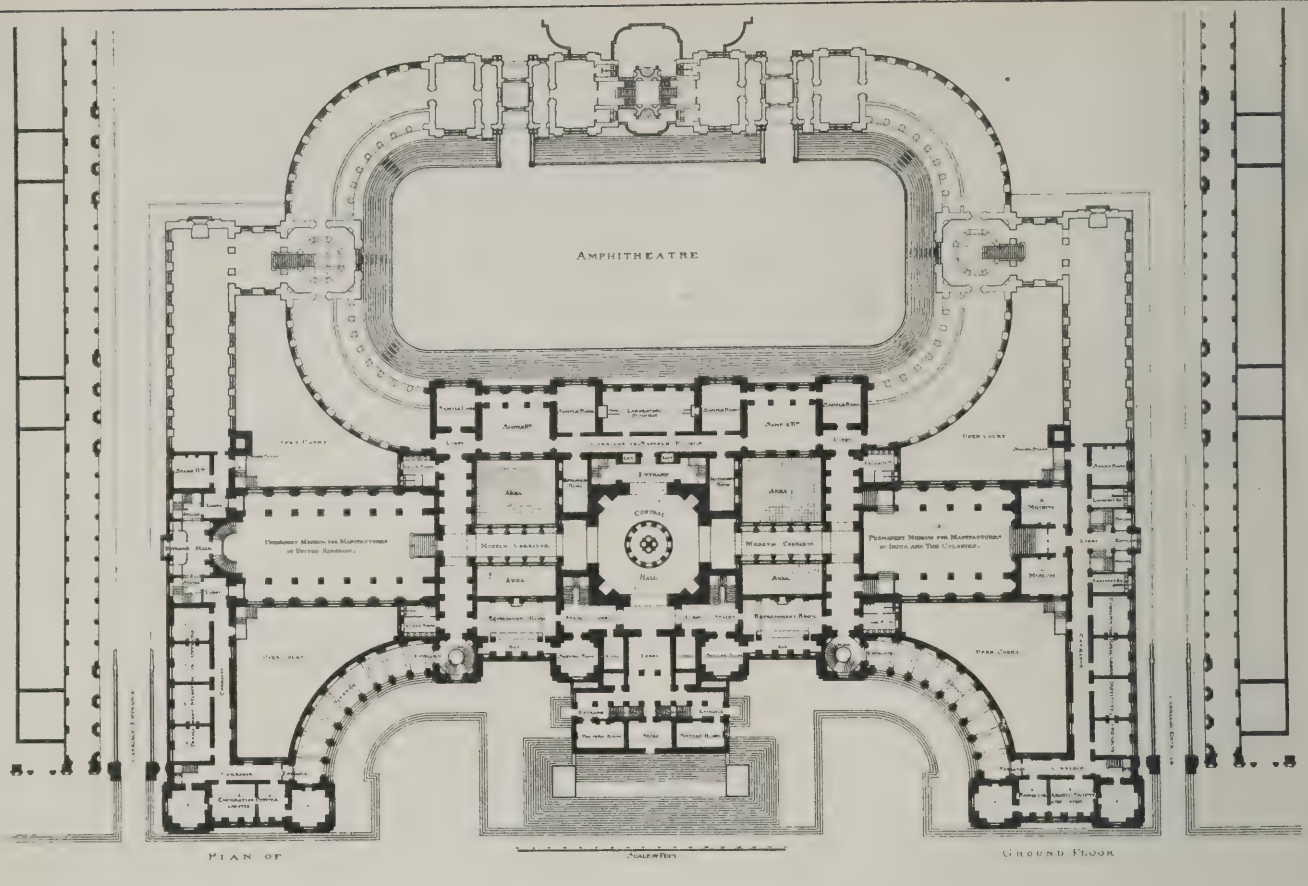
The Mayor of Croydon has laid the foundation-stone of a new reservoir, which is now being constructed by order of the Croydon Corporation on the Addington-hills. Mr. C. C. Moorland, Chairman of the Water Committee of the Corporation, stated that the estimated cost of the undertaking would amount to between £40,000 and £50,000. The Mayor then duly laid the stone, which bears an inscription to the effect that the "Addington Reservoir" has an overflow of 465ft. above the level of the sea; that its length is 420ft., its breadth 124ft., a depth of 16ft. 8in.; and a capacity of 5,000,000 gallons.

The Bishop of Chester preached at St. Anne's Church, Sale, on Wednesday week in connection with the dedication of the north aisle, organ chamber, and choir vestry, which recently have been added to the edifice. By these additions the number of sittings in the church has been increased from 789 to 845 at a cost of £1,500. Mr. John Lowe, St. Anne's-square, Manchester, was the architect, and Mr. J. B. Kendal, of the same city, the builder.

COMPETITIONS.

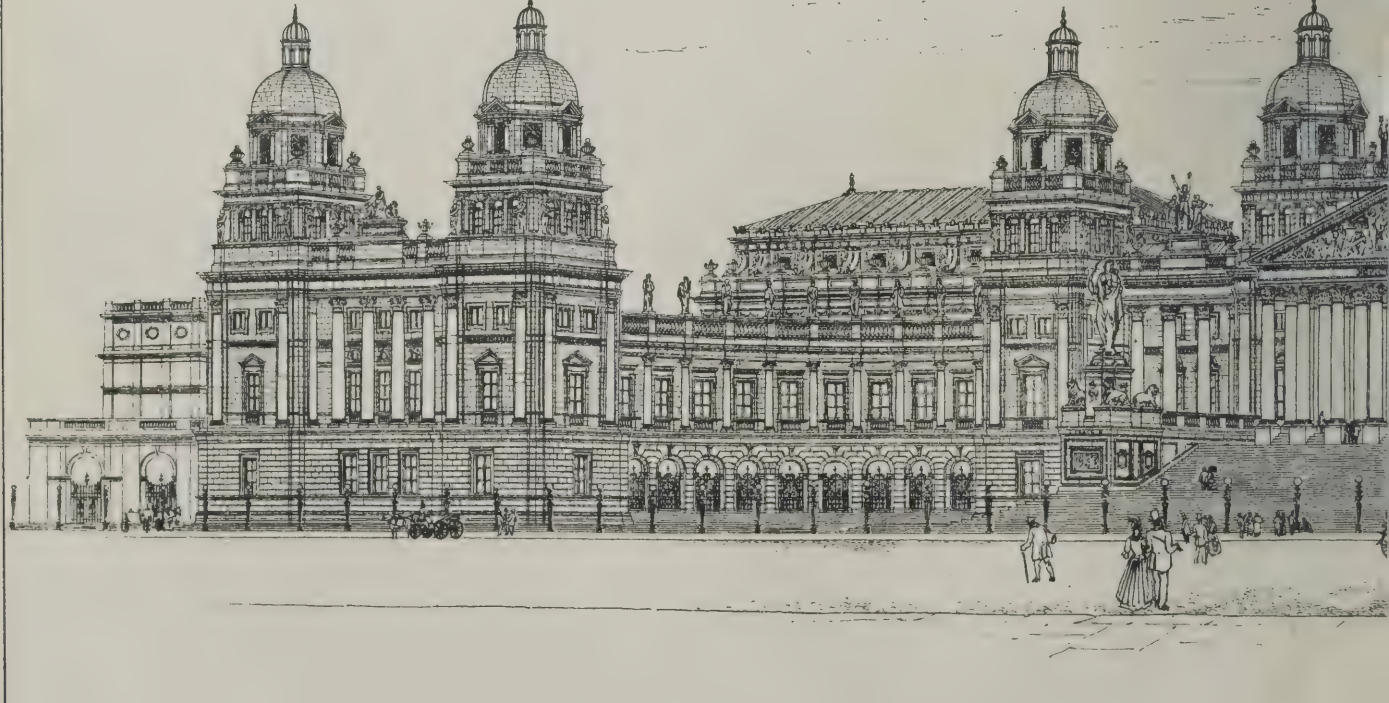
Gateshead-on-Tyne. — The Gateshead School Board recently invited plans from local architects for a group of schools to be built at Teams to accommodate one thousand children in three departments, with schoolkeeper's house, the limit of cost being fixed at £5,000, exclusive of school desks. Thirteen sets of designs were received, and a committee recommended that the first premium (to merge in the ordinary architect's commission) be awarded to "Derwentwater"; the second of 20 guineas to "Evolution," and the third of 10 guineas to "l'Ecole." The premiated plans all showed the boys' and girls' departments placed one above the other, with infants' in separate building. Plain brickwork was proposed for elevations on account of low limit of cost. No one plan fully met the conditions, "Derwentwater" failing to place caretaker's house so as to command all the entrances, nor could all his classrooms be seen from head teacher's desk; while "Evolution" gave direct light on one side only of two of classrooms, the other side receiving borrowed light through a glass partition. The report was adopted and the envelopes opened, when it was found that "Derwentwater" was by Mr. W. H. Dunn, of Newcastle-on-Tyne, who was appointed architect for the schools; the second, "Evolution," by Mr. Stephen Piper, M.S.A., 2, Millfield-terrace, Gateshead-on-Tyne; and the third, "l'Ecole," by Mr. Gibson Kyle, of Newcastle.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.



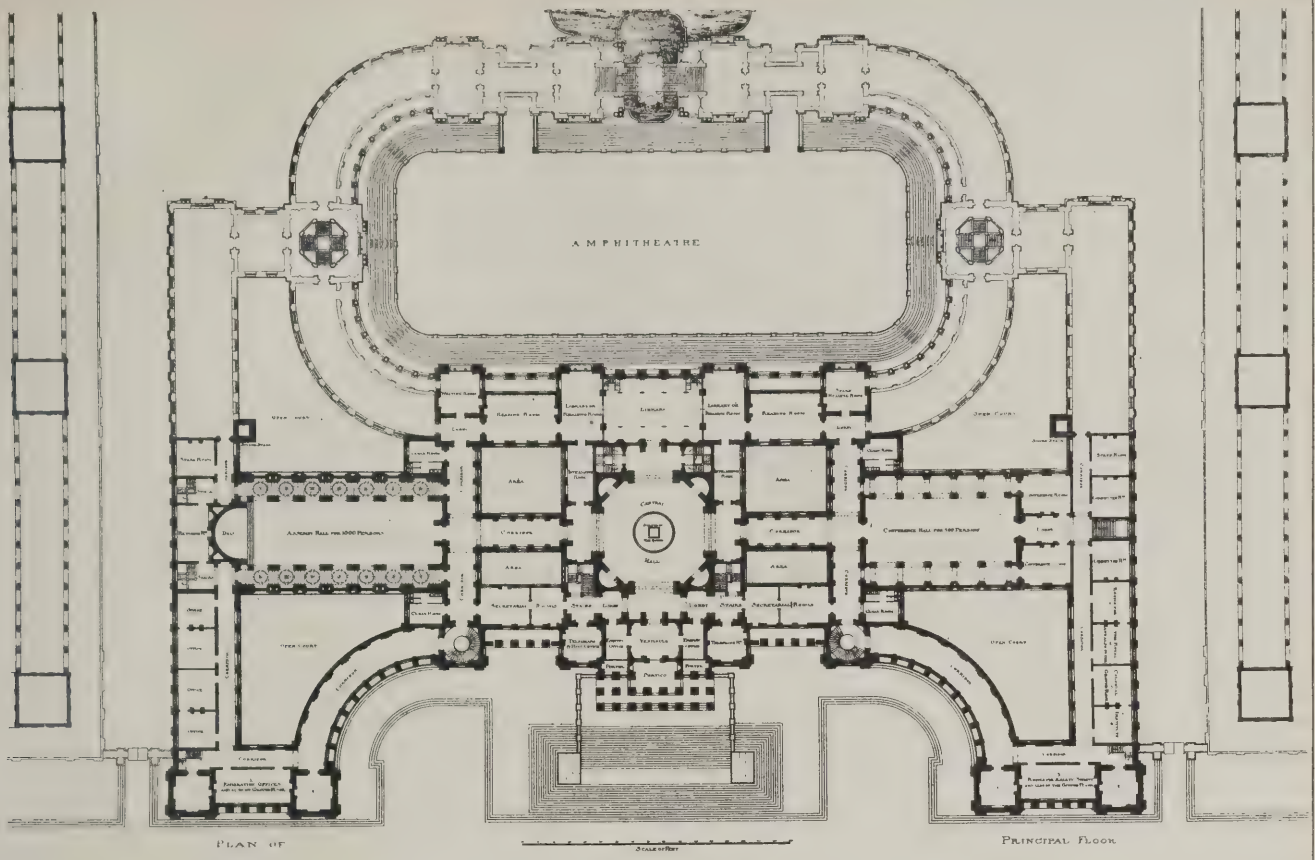
Antiquarian Society of Newcastle-on-Tyne.—The sixth country meeting of this society were held on Saturday afternoon, when Bywell and its vicinity were visited. The party alighting at Stocksfield Station, first examined a round hill on the south of the railway, which has evidently been a stronghold of the Ancient Britons. Some of the earthworks by which it has been fortified still remain. At Bywell the antiquaries went to the church of St. Peter's, where an address was given by the Rev. Anthony Johnson, vicar of Healey, upon the history and characteristics of the two churches of Bywell. It appears that some portions of the north wall and the north pillars of the nave of St. Peter's are Saxon. The rest of the chancel was built about 1160, while the tower was built in the thirteenth century. The tower was intended as a refuge for the inhabitants in times of danger as much as for ecclesiastical purposes. On entering the church Mr. G. C. Hodges lucidly described its peculiarities. The church of St. Andrew was next visited. Its tower is a noble specimen of Saxon work. The rest of the church belongs to the Early English period. The church of late has been restored, and all its ancient features, so far as the interior is concerned, destroyed. Into its exterior walls have been inserted a very considerable number of ancient grave covers. Bywell Castle was afterwards reached, a building now in ruins. It was built by Ralph de Neville between the years 1472 and 1485, but was not completed. Hence probably its present ruined condition.

A visit of the Society of Architects has been arranged to take place to-morrow (Saturday) to St. Cuthbert's Church, Philbeach Gardens, at 2.30 p.m. (nearest station Earl's Court), and to St. Paul's Church, Hammersmith, at 3.30 p.m. The party will be conducted by the architect, Mr. H. R. Gough, F.R.I.B.A., past President of the Society.



The parish church of St. John the Baptist, East Markham, was reopened last week by the Bishop of Southwell, after restoration from plans by Mr. Scott. £3,000 has been expended on the work, which has been carried out by Mr. Rudd, of Grantham.

Some paintings and decorations have just been executed at St. Luke's Church, Camberwell, from designs by Mr. F. Shields, artist, by Messrs. Cox, Sons, Buckley and Co., of Southampton-street, W.C. These paintings are illustrative of Christian parables and symbols.



At a meeting on Monday of the Governors of the George Heriot Trust, Edinburgh, Mr. Thomas Hudson Beare, University College, London, was unanimously appointed Professor of Mechanics and Engineering in the Heriot Watt College.

DUTIES OF A CLERK OF WORKS.*

R. LEANING, whose useful set of "Contract Documents" we lately noticed, has brought out a little book on the "Duties Clerk of Works." The subject is a good , as we are not aware of any book extant n the duties of this important functionary. could only have wished the author had tten a complete guide to those duties, as we sure many would have welcomed it. Mr. ning has here devoted a few pages to remove e of the difficulties in the path of the clerk vorks, and to insure more uniform practice. h this object he has given a form of report progress, which Mr. Alfred Waterhouse, , has furnished, and has supplied under the ds of the trades a few suggestions of value, des indicating the duties of the office. The l clerk of works is not often to be met with. h class of building requires certain qualitions, and the most important material to lealt with is a point to be considered in the ice of one. Thus, for high-class masonry joinery it would be very little use to employ erk of works who had been chiefly engaged rdinary brick buildings; for an iron and s structure one conversant with iron conction is absolutely necessary. Of course, primary duties of the clerk of works are to e himself master of the design of the itect, to read the drawings and specifications aright, to keep account of materials and ur expended, to keep down extras, and to rt progress to the architect weekly or thly. He may be, and often is, required to e working details, and to keep account he time of the men, and of the mals used, so as to furnish to the architect approximate estimates of the work done. Later on he is required to make out a list of items of extras and deductions for the surveyor, a business requiring methodical bookkeeping.

Many hints are given by the author, which will be a guide to the young clerk of works in interpreting specification clauses. Thus, the clause often inserted, "Each trade to attend on all others, and do all jobbing work required," implies that all "trades are to attend generally upon all others, cutting and making good, except to gas-fitter, bell-hanger, and hot-water engineer, as for conservatories. But the clause covers domestic hot-water supply." Referring to "setting out," the author says "the clerk of works should not set out, but should check the setting out after it is done." Under "Carpenter" the advice is given not to depend slavishly upon brands on timber or deals—they are not conclusive, as parcels of timber with a good brand have often the best pieces withdrawn and sold at enhanced prices. Points under each trade likely to be neglected are noted. The author further alludes to the Government clerk of works in the Public Works Office, and the subjects of examination are pointed out. The "special regulations" respecting open competitive examinations for clerk of works in the Office of Her Majesty's Works give the following subjects:—1, Handwriting; 2, orthography; 3, English composition; 4, arithmetic to vulgar and decimal fractions; 5, geometrical drawing; 6, knowledge of materials; 7, designing simple buildings, with specification and estimate, and working drawings of details of carpenters' and masons' work; 8, taking out quantities from plans, measuring and valuing; 9, modern sanitation. Mr. Leaning's book will be found a useful guide, and is small enough to be carried in the pocket.

*he Duties of a Clerk of Works. By J. LEANING. on: B. T. Batsford, High Holborn.

VENTNOR NEW PIER.

IN the year 1870 a private pier company erected a pier at Ventnor, to which, in 1880, they added a landing stage. Soon after, in a gale, this stage was demolished, and the pier head and nearly half of the structure were carried away. The wrecked pier remained till 1884, when the Ventnor Local Board obtained an Act of Parliament which enabled them to purchase the old pier at a cost of £3,500. They bought the old pier, and have since carried out a new promenade and landing-place. Mr. Henry E. Wallace was the engineer selected by the Board in competition, and he appointed Mr. Theodore Saunders, Ventnor, as resident engineer. The contract was obtained by Messrs. Trehearne and Co., of Battersea, and Mr. Grace, of Southampton, has acted as foreman of the works. The head of the pier is shoe-shaped, measuring 100ft. by 80ft. A glass wind-screen is fitted at the head, and a band-stand of cast-iron is erected within this screen. There is a landing-stage entirely disconnected from the pier. The stage consists of two levels, one for high-water the other for low, and is constructed upon green-heart piles 14in. square, and braced in wrought iron. The head is raised 18in. above the trunk of the pier, and is reached by three steps. The width of the body of the pier, measuring between the backs of the seats, is 25ft. It is built throughout on cast-iron piles, braced with wrought iron. There are wrought-iron gates at the entrance. Inside are the turnstiles, tollhouse, cloak-rooms, and lavatories. Tesselated pavement is laid just within the gates, and extends to the commencement of the flooring of the pier. The whole structure measures, from end to end, about 650ft. The cost of the pier has been nearly £12,000.

ILLUSTRATIONS.

PROPOSED DESIGNS FOR THE IMPERIAL INSTITUTE.

OUR LITHOGRAPHIC ILLUSTRATIONS.

THE IMPERIAL INSTITUTE.

THE authors themselves probably need no explanation of the week's delay we ventured to make in the reproduction of their designs. To the rest of our readers we may say it was thought better to reproduce them properly, and as the photographs had to be taken at South Kensington, a little more time was desirable. In another number we shall complete the series by some additional illustrations of one or more of the designs.

THE CHURCH OF ST. BARTHOLOMEW, LOSTWITHIEL, CORNWALL.

OF the Mediæval architecture of Cornwall comparatively little is known; the chief interest of this county being centred in its numerous cromlechs, inscribed stones, and other primeval remains.

The greater number of Cornish churches belong to the Perpendicular period, and it is very remarkable the resemblance one church bears to another in the designs of this time. There are very few remains of Norman work, but of the 13th and 14th centuries several good examples exist, and the one especially worthy of study in the earlier period is that of St. Bartholomew, Lostwithiel, presenting a specimen of design worthy of the highest and most successful periods of English architecture, and, with the exception of some little additions in the 16th century, the fabric may now be said to be intact as originally erected in the early part of the Decorated period.

The church consists of a chancel, nave and aisles, south porch, and tower at west end, with its beautiful spire,* unique of its kind, I believe, in England. Each side of the octagonal belfry is pierced by two pointed leaded lights with a quatrefoil in the head, divided by a sort of shaft mullion, circular in plan, and divided in the middle by a transverse consisting of a double row of quatrefoils of bar tracery; each side being surmounted by a gablet of plain but telling character. The same design appears on each face, except that on the north-east side, where the transome is formed by a circle divided into six trefoiled divisions, with a quatrefoil in centre. A bold effect is gained by the introduction of a three-quarter round moulding at the angles of belfry and terminated at the top with a head of grotesque character. Immediately below the sills of the windows the diagonal sides of the octagon converge and form the square of the tower, which is divided into two stages, marked on the outside by a set-off in the walls; the tower story is supported by buttresses of massive proportions.

Lostwithiel is situate about six miles south of Bodmin, and is of very early date—indeed, it is said to have been a Roman station, though no traces of that period have, I believe, been found. According to tradition, Lostwithiel was so called as having been the residence of Withiel, anciently Earl of Cornwall, who had a palace at Penknight, a part of this borough. In the reign of Richard I. the town was held under the Earl of Cornwall by Robert de Cardinham, who procured for it the privilege of a market, and Richard, Earl of Cornwall, brother of Henry III., made Lostwithiel a free borough. Dugdale asserts that the parish church was profaned by the Parliamentarian soldiers, and injured by an explosion of gunpowder in 1644.

H. P. BURKE DOWNING.

* This spire was illustrated from a drawing by Mr. W. H. Lethoby in the BUILDING NEWS for Oct. 24, 1876.

CHURCH OF ST. CLEMENT, SANDWICH, KENT.

THE church of St. Clement, Sandwich (from Latin Sabulovium, or Sandy Town), is one of the most interesting of the Kentish churches. It is both large and handsome, consisting of a nave and chancel, each with side aisles, and a very fine Early Norman tower, rising from between the nave and chancel.

This is an uncommonly beautiful specimen of enriched work of the period. The piers supporting it are composed of clustered columns, with carved Norman capitals, connected by four lofty semi-circular arches with good mouldings, opening into the interior, and above which is a band or small arcade of semi-circular arches with single and double columns alternately treated in much the same way as in the exterior.

The church contains good examples of work of each style from the 11th to the 15th centuries, though the greater portion is of the latter, or Perpendicular, period.

The building was a few years ago in a very dilapidated condition, but has since been most carefully and successfully restored by Mr. Joseph Clarke, F.S.A., and as an example of good Norman work it should certainly not be missed by architectural visitors to this part of the county.

H. P. B. D.

These two sketches were submitted by Mr. H. P. Burke Downing for the Architectural Association Travelling Studentship of this year, and awarded the second prize.

AT THE SALE-ROOMS.

OUR illustration this week is of some furniture that was recently sold at Messrs. Phillip, Son, and Neale. The China Cabinet was of tulip-wood, mounted with ormolu. The front was made up of four panels, having a drawer over, and was inlaid with ebony, satinwood, and various other woods. The little Moorish Stool was a characteristic piece of that work which is celebrated for beautiful inlays of mother-of-pearl, ebony, &c. It was hexagonal, each leg being inlaid at the angle, and having little Moresque arches in each side of the hexagon. The inlaid pedestal Cupboard calls for no special remark. The Italian carved Chair was a good example. We also give a few details of the Ormolu mounting to the China Cabinet.

SHINGLE HOUSE AT THE AMERICAN EXHIBITION.

WE illustrate this week a full-size Shingle House, of two stories, with a verandah all round, and a piazza leading from the upper floor. The house is very picturesque, and of pleasing design. In America great numbers of these houses are in vogue, where at the principal watering-places and summer resorts whole colonies of them are constantly being erected. No two designs being alike, the monotony usually observed in places of a similar description in this and other countries is entirely avoided. Individual tastes may be readily satisfied, both as to internal and external details, with the greatest ease. They are adapted for any climate, and the mode of construction renders them warmer in winter and cooler in summer than ordinary brick houses. (We may remark, in passing, that this has been well exemplified in the house in question during the hot summer we are now experiencing.) The buildings are prepared and fitted together in Canada and America, and as only the best Canadian white pine is used, this may be regarded as a guarantee of their longevity. Climatic influences have little or no effect whatever; indeed, they are improved externally in appearance by weathering. The house illustrated has been designed and erected by Messrs. Stent and Co., of New York, and 18, Parliament-street, at the American Exhibition, Earl's-court, and we believe that Company have already secured important orders for these houses, and are in a position to execute contracts on the shortest notice. We shall welcome the erection of many such houses at the seaside for instance, and in country districts where the dull, unending, staring white plaster and stucco do much to ruin the natural beauty of the scene.

CHIPS.

Mr. Comenius Davies, who for many years was deputy city engineer for Liverpool, died on Saturday at his residence, Kinglake-street, Edgehill, near that city. Mr. Davies retired from active service some time ago, but continued to give the Health Committee of the Corporation the benefit of his ability and extensive experience. He was especially noted for his intimate acquaintance with the great drainage system of Liverpool. Mr. Davies had reached the 77th year of his age.

The Sheffield corporation have adopted a recommendation by the Sewerage and Rivers Committee that the Corporate Common Seal be affixed to the appointment of Mr. C. J. Innocent, architect and surveyor, as single arbitrator to settle the amount of compensation to be paid to David Ward "for the loss and damage alleged to have been sustained by him in respect of his property at Walkley Bank by reason of the construction of works of sewerage."

The east window of Upper Arley parish church has been filled with stained glass as a memorial. The window is of five lights, representing in the upper portion various scenes connected with our Lord's Passion and Crucifixion; and in the lower part the five prophets who foretold the same are depicted—Hosea, Isaiah, David, Ezekiel, and Zechariah. The window is from the studio of Mr. Kemp, and completes the restoration of the church, carried out last year, under Mr. Lewis Shepherd, of Sansome-walk, Worcester.

A memorial tomb has been erected in Eling burial ground, Hants, over the grave of Sir Henry C. Paulet, Bart., by whom the ground was presented to the parish. Messrs. Garret and Haysom of Southampton, executed the work.

The Braid United Presbyterian church at South Morningside, Edinburgh, was opened on Sunday. Mr. G. Washington Browne, of Edinburgh, was the architect of the church, which has cost £5,000.

The city council of Canterbury have received 124 applications for the office of city surveyor. The Roads and Survey Committee have gone through the testimonials, and selected about 40 from the number. These were further considered on Friday afternoon, and the following selected to appear before the town council:—Messrs. Alfred Dryland, Deal; J. C. Webster, Malton; Henry Richards, Kingston; J. Haigh, Abergavenny; Charles Lawgreen, Nuneaton; W. H. R. Crabtree, Rotherham; Charles Brownridge, Leeds; H. C. Crummack, York; George W. Lund, Blackburn; J. A. Angell, Stratford; E. L. Elgar, Broadstairs; and Philip Murch, Portsmouth.

At a special meeting of the proprietors of the Sheffield Waterworks, held on Monday, the terms of agreement recommended by the directors for the sale of the undertaking to the corporation were unanimously confirmed. The terms are equivalent to a purchase price of rather over £2,000,000. The Corporation Bill seeking the power of purchase is now before Parliament, and is expected to pass as an unopposed measure.

New head offices have just been erected for the Rock Freehold Land Society (Limited) at 112, Westminster Bridge-road, facing Kennington-road. The building is Renaissance in character, four stories in height, finished above with open balustrade, and is faced with Portland stone. The offices have been erected from plans by and under the personal superintendence of Mr. Charles Blinco, the society's surveyor.

A series of lectures on "Style and Styles in Building" is to be delivered on the 19th, 22nd, 26th, and 29th of July, at 8.15 p.m., at the Guilds Central Institute, Exhibition-road, S.W., by Mr. Lawrence Harvey. The fee for the course is 5s.

The York Race Committee are expending £1,200 in adding another story to the Subscription Stand at Knavesmire. This, when completed, will double the accommodation hitherto provided, the lower portion remaining the same. Mr. Fisher, of York, is the architect, and the work is being done by local firms.

Building Intelligence.

BEDFORD.—The parish church of St. John the Baptist has been reopened by the Bishop of Ely, on completion of the restoration, consequent upon its injury by fire on the 28th July, 1886. The conflagration having totally destroyed the chancel and organ-chamber roofs, also the roof of the choir, together with the fittings, windows, and seats, new roofs have been put on. Upon examining the old roof over the nave, it was found that what were supposed to be oak tie-beams were simply lath and plaster bracketed out and painted to imitate oak. The new chancel roof is open timbered of the hammer beam type, framed and trussed with circular ribs and braces, springing from carved corbels of Bath stone. The roof over the choir is of the trussed rafter type. The roof over the nave has trussed principals, and is of pitch-pine. One of the most interesting features of the restoration is the re-instatement of a continuous stringcourse in nave and chancel found beneath the plaster. The choir and nave have been refitted with pitch-pine open benches on wood flooring. All the windows have been reglazed with cathedral tinted glass in quarry shapes with margins of ruby and maze. The reredos has been painted by Mr. Leach, of Cambridge. The whole of the work has been executed by Mr. S. Foster, of Kempston. The works have been carried out from the designs and plans of Mr. John Day, M.S.A., of 12, Victoria-terrace, Bedford, diocesan surveyer. The cost of restoration was about £1,700.

BOOTHEN, STAFFS.—The corner-stone of the mission church of All Saints', Boothen, near Stoke-on-Trent, was laid last week. The building, when completed, will consist of a nave, with north and south aisles, chancel, with north chapel, organ chamber, and vestry, and two porches, north and south, at the western end of the aisles. There will also be a small baptistery at the west end, and a bell-cot over the western bay nave. The walls will be built of grit stone from Wall Grange, the external weatherings being of the same stone, and the dressings of Beggerswell stone. The style of architecture is Late Perpendicular, and the seating accommodation will be for 600. Messrs. Lynan and Rickman, Stoke-on-Trent, are the architects, and the contractors for the whole work are Messrs. Yoxall and Heath, of Stoke-on-Trent, whose contract amounts to £3,300.

HULL.—The buildings of the Hull and Sculcoates Dispensary in Baker-street were opened on Wednesday week. The premises include the dispensary and a residence for the house surgeon, which are entirely distinct. The dispensary contains a waiting-hall, 25ft. by 23ft., paved with wood-block flooring, and with a dado of glazed bricks around the walls, which accommodates 90 patients. A bust of the late Mr. W. T. Dibb, executed in Carrara marble by Mr. W. Day Keyworth, jun., stands in a niche in the wall of this hall, and was unveiled at the opening ceremony. At the back of the waiting-hall is the house-surgeon's consulting-room, having separate doors for the entrance and exit of patients. Adjoining is the dispenser's room and drug store. The board-room is placed to the right. The surgeon's residence includes dining-room, kitchen, and offices on the ground floor; drawing-room, two bedrooms, and bath-room on the first floor, and two bedrooms on the second floor. The design is of Flemish Renaissance character, executed in red brick, with Ancaster stone dressings, and with the roofs covered with red Broseley tiles. Messrs. Botterill, Son, and Bilson, of Hull, are the architects of the building, their design having been selected in a limited competition. The works have been carried out by Mr. Frederick Blackburn.

MANCHESTER CATHEDRAL. — The chapel erected at the cost of Mrs. Fraser, as a memorial to Bishop Fraser, was consecrated, and the Diocesan memorial cenotaph and effigy of the late prelate, was unveiled on Friday. The chapel and tombs were designed by Mr. J. S. Crowther, the Cathedral architect, and the recumbent figure is by Mr. James Forsyth, of Finchley New-road, London, whose model of the work is now on view at the Royal Academy. The chapel is situated at the extreme east end of the south chancel aisle, and is 13ft. square. The roof is of English oak, laid out in small panels, with mouldings. The spandrels of the beams and wall posts are sunk and filled in with tracery. Outside the chapel are two corbels at the spring of the window, on which are carved likenesses of Queen Victoria and Bishop Fraser. These have been carved by Mr. Ralph Wales, a local sculptor in the employ of Messrs. Earp, Son, and Hobbs. Mr. Crowther has followed the original Perpendicular style of the church. The contract has been carried out by Messrs. Stores and Sons, of Stalybridge, under the superintendence of the clerk of the works of the present Cathedral restoration, Mr. John Jenkinson. The floor pavement is formed of ceramic mosaic tiles. In the centre of the chapel stands the cenotaph or altar tomb; it has been designed by Mr. Crowther in accordance with the Perpendicular character of the chapel, and executed by Messrs. Earp, Son, and Hobbs. The plinth is composed of polished Scotch granite, and the niches, pedestals, canopies, buttresses, and pinnacles are all of highly-polished alabaster. On the north and south sides, in the niches, are introduced statuettes, in white statuary marble, of the Twelve Apostles, with shields in the centre on which are carved the bishop's coat-of-arms empaled with the arms of the diocese of Manchester. At the east end is a representation of Our Lord as the "Light of the World," and at the west as the "Good Shepherd," with adoring angels on both sides. In the frieze of the cornice is an inscription. On the tomb is Mr. Forsyth's recumbent effigy of the bishop, executed in white marble. The figure is life-size, and is draped in the modern robes of an Anglican bishop. The left arm is disposed at length by the side, resting upon a pastoral staff, while the right hand rests upon the breast, clasping a prayer-book. Angels in a kneeling attitude are placed at the four corners, all differing in action and expression. During the past week Mrs. Fraser has caused to be placed on the west wall of the chapel a brass with an elaborate border, on which is an inscription from the pen of the Very Rev. Dean Vaughan.

SOUTHAMPTON.—The trustees of Thorner's Almhouses for aged women have ordered the erection of an additional block to the houses in Polygon-road, Southampton, the brickwork of which is now nearly completed. Built on the west side of the older block, it resembles it in character and in the white bricks with red stringcourses of which it is composed; but there are several architectural improvements, and one of a structural character which will doubtless prove of substantial advantage—viz., the substitution of wings in the rear for the kitchen accommodation in the basement of the older buildings. The new block will afford on its two floors sets of three rooms each—sitting-room, bedroom, and kitchen—to eight additional inmates. It is 66ft. in length by 28ft. depth, the wings at the back each measuring 20ft. by 16ft. There are corbelled pent-roofed porches to the two front entrances, and red brick gauged arches over the windows, with a brick moulded eaves cornice and close-boarded and slated roof. The architects are Messrs. E. I'Anson and Son, 7a, Laurence Pountney Hill, London, and the builder Mr. Udall, of Carlton-place, Southampton. It is intended to build another block somewhat to the rear of and between these two, and connect the three so as to form three sides of a square.

SPARKWELL.—A memorial pulpit has been erected in Sparkwell Church, Plympton, S. Devon, of which the Rev. Pender H. Cudlip is the vicar. It was designed by the Rev. E. Geldart, of Little Braxted, Witham, Essex. The base is of freestone and the superstructure in English oak, with traceried and carved panels and cornices. The central panel contains a sculptured figure of St. John the Baptist in high relief, standing on a carved corbel, and a riband over the figure bearing the words, "bring forth fruits of penance" carved thereon. A "brass" inserted in one of the panels bears the inscription in Old English text. The whole of the work has been executed by Messrs. Luscombe and Son, sculptors and art workers, of Exeter.

VENTNOR.—At the Royal National Hospital for Consumption at Ventnor a new block of buildings for the reception of patients, erected under the provisions of the will of the late Mr. John Jones, of Piccadilly, has been built, and will shortly be opened. Everywhere the lofty, airy corridors and bedrooms are receiving additions of comfort, combined with cheerfulness, and the provision of every detail necessary to the recovery or improvement of the patients. The hospital is constructed on the cottage principle, and occupies an extensive piece of land in the Undercliff, and overlooking large garden ground. To the new dining hall accommodation will now be provided for 140 patients. The new block is larger than any of its predecessors. The whole of the patients can be accommodated. The tables used for dining purposes are so constructed that they may be placed together and used as a platform for entertainments. At each end are sitting-rooms, and on the left of the entrance hall are apartments for the head nurse and the dispensing, and on the right are consulting and waiting rooms. Upstairs are bedrooms for 20 patients, each to have a separate apartment, and all facing the south. A verandah runs outside the bedrooms. Lifts communicate with the kitchen, which was illustrated in the BUILDING NEWS for March 18th of present year; there are bath-rooms and lavatories, and a room heated by steam, where blankets and sheets are kept free from damp. A heavy lift also passes through each of the four stories of which the building is composed. There is a separate staircase for the servants. On the top story is a kitchen; it has white glazed bricks. The floor is tiled, and the cooking is to be done by a kitchener, with tiers of ovens built in at the side, all heated by one small fire chamber. The scullery and larder, adjoining the kitchen on the same floor, are also built with white glazed bricks. The sitting-rooms and bedroom each have a box of steam pipes. In the coldest weather the air passes through these pipes into the room at a temperature of 62 deg. By means of a fan, worked by an engine in the basement, the vitiated air in each of the rooms is drawn through a grating near the ceiling, and by this means an atmosphere as pure as possible is maintained. The architect of the new block is Mr. Hellyer, of Ryde, and the builders are Messrs. Ingram and Son, Ventnor. The cooking arrangements are by Messrs. F. Edwards and Son, 54, Great Marlborough-street, London, and were recently illustrated in this journal. The sewerage arrangements for the set of buildings are distinct from other systems in the neighbourhood. The drainage discharges into one channel carried under the rocks 200 yards right out to sea.

WARRINGTON.—The foundation-stone of a new chapel to be erected in close proximity to and for the joint use of the Training College and Clergy Daughters' School, off Manchester-road, was laid by the Dean of Chester on Friday. The contract has been let to Messrs. Gibson and Sons, of Church-street, Warrington, and the work is being carried out from designs and under the superintendence of Mr. James Adams, Sankey-street, in the same town. The building will comprise nave, chancel, with apse, and entrance porch, the communication with the colleges being by a covered cloister. Architecturally, the building will be Early English in style, and the materials used will be red brick and Rainhill stone dressings. Internally the walls will be faced with buff bricks with red arches and panels, open-timbered roof and seats and stalls of pitch-pine. The stonework will be executed by Mr. Gittens, of Warrington, and the stained glass will be supplied by Messrs. Williams and Son, of Chester. The chapel will be heated by hot air by Messrs. Newton, Chambers, and Co., of Sheffield. The pews, pulpit, and clergy stalls will be made by the contractors from designs especially prepared by the architect. The cost will be £1,400, and 200 seats will be provided.

The Queen formally laid last (Thursday) evening the foundation-stone of the equestrian statue of the Prince Consort, which is to be erected in Windsor Great Park as the women's Jubilee offering to Her Majesty. A red-brick pedestal has been built to carry the foundation-stone. The mason's mallet used by the Queen belongs to Mr. Hollis, the contractor. With it George IV. laid the first stone of the gateway between the York and Lancaster Towers at Windsor Castle on August 12, 1824, and it has since been used for other ceremonials by the Crown Princess of Germany and by Prince Christian. The statue will be a replica in bronze of the one by Marochetti at Glasgow.

Engineering Notes.

THE FORTH BRIDGE.—The granite piers on the south side of the Firth, which support the approach girders, were raised on Friday to the full height of 150ft. The work on other portions of the bridge is progressing rapidly. On the island of Inchgarvie the vertical tubes have now reached a height of over 200ft., while the cantilever tubes both on the north and south sides of the Firth have been carried out a distance of about 100ft., and are in the mean time supported by temporary struts attached to the vertical tubes at a height of about 150ft. The approach girders on the north side, which were completed some time ago, are being finished off on the land side by the construction of three stone arches, which are also nearly completed.

MODERN HARBOUR CONSTRUCTION. — A paper on this subject was read at Edinburgh on Monday night before the Royal Scottish Society of Arts, by Mr. Alan Brebner, C.E. Referring to breakwaters of masonry, the lecturer said that their construction in exposed situations presented difficulties that were practically insurmountable, instancing as examples the harbour works at Plymouth, Alderney, and Portpatrick. In regard to the works at Pulteneytown, Wick, he said the lesson to be derived from them was that a breakwater erected with a perpendicular face to the sea, composed of open work below low water, and covered up with a solid air-tight superstructure, was of itself incapable of resisting for many years the impacts of heavy seas such as those of Wick Bay. The reason was that the interstices between the lower blocks got filled with air or water, and when the waves struck the face of the wall the air was compressed with tremendous force. The internal recoil thus made loosend the blocks, which were broken or forced outward by the reacting force. The introduction of Portland cement had entirely revolutionised the system of erecting harbours. Mr. Brebner then gave examples of the proper proportion of cement, sand, and stones which had been used with success, and described the different modes of constructing concrete work in exposed situations. The paper concluded by urging the necessity of liberal grants being made by Government for the construction of fishery harbours.

CHIPS.

The City Corporation discussed last week the question of the desirability of appointing a City Architect in succession to Sir Horace Jones, and decided by the bare majority of one vote not to fill the appointment, but to appoint instead a "City Surveyor," whose duty it will be to manage the City landed property.

The Duchess of Albany opened on the 7th inst. three new wards at the National Hospital for the Paralysed and Epileptic, Queen's-square, Bloomsbury, the foundation stone of which was laid by the late Duke the year before his death, the building having been opened by the Prince of Wales two years ago. The new wards comprise the "Duchess of Albany" Ward for children, a ward, unnamed, for female paying patients, and a free ward for male patients, making 55 beds and cots in all, and raising the total accommodation of the hospital to 180 beds and cots. The hospital has been erected from the designs and under the superintendence of Mr. M. P. Manning, and was illustrated in the BUILDING NEWS for June 27, 1884.

The highway board for Hollingbourne, Kent, have raised the salary of the surveyor, Mr. Roper, jun., by £40 per annum.

The extension of the electric tramway from Bushmills to the Giant's Causeway was opened last week for passenger and goods traffic, after inspection by General Stevenson, on behalf of the Board of Trade. The line is constructed on the narrow-gauge principle, with an electric rail raised about a foot and a half from the ground. The extension line is six miles in length, and runs through a rabbit warren, over the River Bush, from Bushmills to within a few perches of the Causeway. Mr. Trail is the engineer.

New business premises are about to be erected next the Canterbury Bank now in course of erection in St. Margaret's-street, Canterbury. The shops and residences above are Renaissance in character, and are faced with red brick, with Bath and Portland stone dressings. Messrs. Cowell and Bromley, of that city, are the architects, and Mr. W. Martin, of Ramsgate, is the builder.

Intercommunication.

QUESTIONS.

[9342.]—**Articles.**—What is usually done at the end of an architectural pupilage? Are the original indentures given up to the pupil, or what form of release has he to show? A pupil whose articles are about to expire would be grateful to correspondents for any information on the subject.—PUPIL

[9343.]—**Cheap Furniture.**—Will any reader kindly recommend any book giving working designs for simple articles of furniture, such as bookcases, to be made by an amateur carpenter?—E. L. H.

[Surely our own back vols. abound in such designs?—ED.]

[9344.]—**S.K.M. Exam.**—Will any reader inform me what books I require to read up for the South Kensington examination on "Architecture"?—DEVON.

[9345.]—**Sewage.**—Will some reader kindly give me particulars for the treatment of sewage in a gentleman's country house, where there is no district sewage system, or recommend me a good book on the subject?—W. H. B.

REPLIES.

[9310.]—**Half-Timbered Walls.**—One of the first principles in building is to be what it seems to be. No architect is bound to show his construction; but what he does show should be what it purports to be, even if it is contemptible. Hence, plaster or cement on lath is quite legitimate, and it has the merit of precedent—i.e., "wattle and dab" (of which by the way, I know probably quite as much as "F. B. P."), and to which I referred on p. 40; but plaster or cement on brickwork is a sham, and worse than the brickwork alone for keeping out the wet, the expansion and contraction of the timbers causing it to bulge from the brickwork, very often in flakes the size of the panel. The "wattle and dab" and its modern substitute, lath and cement, fit into a groove like the panels of a door, and accommodate themselves to circumstances. The thickness of Mr. Rumble's wall is not shown or stated, and 9in. would be sufficient for his purpose; whereas it is doubtful if twice that thickness in brickwork alone would be watertight in some positions where I have carried out buildings of this kind. "F. B. P." admits that half-timbered construction conduces to a warm building. Granted; but it is not so by his method. Veneering the outside of a brick building with stone is quite as barbarous a method of scene-making as the contemptible work "F. B. P." despises. It is well known that brick filling-in alone, or plastered over, is not waterproof, and I know more than one modern timbered building open to this objection. In May last I saw a residence on the borders of Worcestershire and Herefordshire, a good example of wattle and dab construction which, judging by the timbers, must be several centuries old, and bids fair to last a long time if no vandal introduces the brick filling-in. Some two years ago I saw a fine old mansion near Market Drayton, where the filling-in process had been carried out to the inevitable result—*i.e.*, the collapse of the building. "F. B. P." may pose as "Sir Oracle—when he opes his mouth no dog must bark"; but I decline to accept the dictum of one who, by his own showing, does not know the difference between a water and wind-tight building and a shower-bath. My opinions are based on the practical experience (from every point of view) of upwards of 40 years, and I can venture to set my ounce of practice against "F. B. P.'s" ton of theory.—JAMES THORNELOE.

[9331.]—**Mounting Photographs.**—As an amateur photographer of 25 years' experience, and the winner of as many medals and diplomas, my experience is that there is nothing like Glenfield's white starch. Make in the usual way, and pour out into a basin to cool. When cold, it should set nearly to the consistency of an ordinary blanc mange—a trifling bit thinner, but stiff for all that, is the correct thing. Place the photographs in clean water if they are dry, and bring the batch together, all the backs upwards. Lift out all together still, and after draining well, lay on clean white blotting-paper, backs uppermost. Commence to mount by taking a piece of soft sponge wetted, but the water squeezed out of same. Press sponge into the starch, and dab it, so as to mix and break up same, then apply by rubbing over the back of damp photographs. This slight friction will dissolve or rub out any little irregularities of thickness in the mountant. Carefully lift up photo. by two corners and place on card mount. A piece of clean foolscap paper placed upon the face of the photograph is pressed on same by quickly rubbing the fingers over until the photograph is properly laid down, pressing out to the edge by the same means any air-bubbles under photo. The operation is now complete. Possibly lines may be seen here and there slightly raised, showing the direction the sponge charged with the starch has passed over the photo.; but these disappear as the photo. dries. Do not weight the photos. While drying, the next photo. in the batch is ready, back upwards, to receive the starching, and so on until the last is arrived at. The damp photographs are separated from each other only as each is lifted up after starching to place on card. By this means all the photos remain damp and flat for receiving starch to the end.—A TAUPENOT BOY.

[9333.]—**Ventilation and Prevention of Downdraught in Churches.**—I am greatly obliged to Mr. W. P. Buchan and to "Fresh Air" for their replies on the above subject. The former refers to my "wholesale" condemnation of the heating and ventilation. I regret that my words should have had that definite meaning attached to them, as I only intended them as an "opinion open to correction." The subject of down-draughts is, unfortunately, too often practically illustrated in many large public buildings, and my object in placing the subject before the readers of the BUILDING NEWS was not so much with a view to find a remedy for the special case in question, as in the hope that much valuable information might result from the comparing of notes and opinions. In Mr. Buchan's words, I condemn the ventilation of the Congregational church referred to, and given as a test case. I do so because the only means of obtaining such are small swing casements to the windows, and because the openings in ceiling only open into false roof instead of to exhaust air-shafts, and which, I am glad to find, Mr. Buchan agrees with me are necessary. I am sorry that in stating my case I made a most important omission, as it will doubtless lead Mr. Buchan to alter his views as to cause. The openings into false roof have been closed for a couple of years past, and still the down-draughts continue; and it was this fact among others mentioned that led me to think the heating apparatus was a defaulter as well as the ventilation arrangement, and also because we have been able to stop the down-draughts by lighting the upper level chandeliers; but it takes hours to do so by this means. I thank "Fresh Air" for his suggestion to communicate with a certain firm who have had great experience in such matters. I have been acquainted with numerous firms for years past who advise in such matters on their own business systems, but my object would not be gained in so doing. I must testify to the great value I place upon the BUILDING NEWS Intercommunication Column for getting to know "the reason why" in matters of a practical character, which I am glad to say is seldom placed there in vain. In the spirit of seeking knowledge, I would ask "Fresh Air" to say why hot-water heating should be conducive to down-draughts? We may find a link connected with the subject of inquiry in the answer. Would Mr. Grundy favour us with his opinions in the matter also as to the cause of the down-draughts? I will not ask him to name a cure unless he feels at liberty to do so.—REX.

[9333.]—**Ventilation and Prevention of Down-draught in Churches.**—It would scarcely do to allow the assertion by "Fresh Air," on page 74, to pass unchallenged, that down-draughts through the ceiling-openings of a church could not be cured unless a particular new heating apparatus is put in. The assertion is pure nonsense. For some time back, and for some months to come, we will not need heating apparatus. At present we are hot enough. We want fresh air in the church, and to be kept cool without being chilled by draughts, and this is a desideratum which a new heating apparatus will not supply.—W. P. BUCHAN.

[9339.]—**Alterations and Additions.**—"A 12 Years' Constant Reader and Subscriber," and his relation, and the owner, have produced a pretty kettle of fish between them. The best way to get out of the mess would be to hand all documents to a competent and reliable surveyor to make out a proper account of the value of the works done in conformity with the several agreements. If the amount should exceed the sum claimed, the owner to pay the surveyor's fees; but if it should be less than the sum offered, the "12 Years' Reader" or his relative to pay the fees, and if the amount of the account prepared by the surveyor was between the sums claimed and offered, the fees to be divided and half to be paid by each party.—M. M.

CHIPS.

A new façade is about to be built to St. Alphege's Church in London Wall. Messrs. Dove Brothers, Islington and Tokenhouse-yard, are the builders.

The parish church of Rockbeare is about to be restored from plans by Messrs. Hayward and Son, of Exeter, at a cost of about £1,500.

The annual meeting of the Kent Archæological Society will be held on Tuesday and Wednesday next, with Tunbridge as headquarters.

A correspondent writes to complain that the ruins of Melrose Abbey are being "desecrated by the erection of a wooden gravedigger's tool shed against the abbey walls, and entirely filling up the space between two of the buttresses."

A new Wesleyan Sunday-school is in course of erection at Aston, Salop. Mr. J. H. Pickard, of Whitchurch, Salop, is the architect, and Mr. S. Manley, of Aston, the builder.

Messrs. Watt and Wilson, Glasgow, have secured the contract for the erection of a new station in Greenock in place of that in Cathcart-street.

The result of the poll in Clapham, under the Public Libraries Act, was a declaration in favour of the free library by a majority of 1,135.

The Huntley chapel attached the parish church of Preston-on-Wye has just been restored from plans by Mr. Nicholson, of Hereford, who was the architect for the restoration of the church in 1883. Mr. James Davies, of St. Nicholas-street, Hereford, has been the builder; and the re-opening service will take place on Thursday next.

The annual summer meeting of the Architectural and Archæological Society will be held at Nottingham on Tuesday and Wednesday in next week, the 19th and 20th inst. Excursions will be made to Woollaton Hall, Bakewell, and Haddon Hall.

A special loan exhibition of works of art is to be held at the South London Free Art Gallery in Battersea New-road during the autumn months. The movement is under the patronage of Sir Frederic Leighton, Sir J. D. Linton, Mr. G. F. Watts, R.A., Mr. E. Burne Jones, A.R.A., the Hon. John Collier, and Mr. Walter Crane. The treasurer, Mr. W. Rossiter, Birchanger Hall, Bishop's Stortford, appeals for aid in money or by the loan of pictures.

A new Congregational church and schools are about to be built at Cirencester from plans by Mr. W. Gilbee Scott, of Bedford-row, London.

Plans by Messrs. Hine and Odgers, of Plymouth, have been adopted for a town hall and mechanics institute about to be built at Buckfastleigh.

PARLIAMENTARY NOTES.

H.M. OFFICE OF WORKS' EXAMINATIONS FOR CLERKS OF WORKS.—On Monday Mr. Lewis H. Isaacs asked the Secretary to the Treasury whether the candidates at the examination held last April for clerks of works to Her Majesty's Office of Works and Buildings had complained of the too theoretical character of the examination, and whether it would be reformed and rendered more practical in the future; whether the clause which stipulates that a candidate "shall have been employed five years superintending buildings" should be read as fixing the time to be wholly devoted to such duties; and whether a healthy, noiseless, and comfortable room suited to the purposes of an examination would be provided for conducting the examinations in future.—Mr. W. L. Jackson: There were some complaints from candidates examined last April for clerk of works in the Office of Works and Buildings as to the too theoretical character of the examination; but on inquiry into the matter those complaints proved to be groundless under the existing regulations. The Civil Service Commissioners are not aware whether the Office of Works consider that the regulations require to be reformed, but it is understood that the matter is under consideration. The Civil Service Commissioners do not consider that the clause which stipulates that "a candidate shall have been employed at least five years in the superintendence of buildings" should be read as fixing the time to be wholly devoted to such duties. The candidates on the occasion in question were examined in a healthy, noiseless, and comfortable room in the office of the Civil Service Commission in Cannon-row.

STATUES, MEMORIALS, &c.

CANTERBURY.—Mr. A. B. Wall, of Cheltenham, has executed and fixed up at Canterbury Cathedral eleven statues in memory of Archbishop Tait. They are placed upon the choir screens on each side of the altar. The Dean has expressed great satisfaction with the artistic treatment of the statues.

STAINED GLASS.

NEWINGTON.—A memorial window, the subject being the parable of the "Prodigal Son," has been erected in St. Mary's Church, Newington. A very beautiful window of three lights, representing SS. George, Michael, and Edward, has also been executed for the memorial church at Lucknow, in India. These works are from the studios of Messrs. Cox, Sons, Buckley, and Co., of London and New York.

CHIPS.

A memorial brass to the late Mr. John Monckton has just been placed in the south aisle of All Saints' Church, Maidstone, by his ten surviving children. It was designed by the late Sir Horace Jones, City Architect, and executed by Messrs. Hart, Son, Peard, and Co. It is mounted in a frame of double marble, the inner being serpentine and the outer dove marble, by Mr. Witcombe, of Maidstone.

A warden's stave, of unique design, for Roundhay Church, near Leeds, has been carried out by Messrs. Jones and Willis, art-metal workers, of Birmingham and London.

The foundation-stone of the church of St. Agnes, Burmantofts, Leeds, was laid on Saturday. The church is to accommodate about 600 or 700 persons. It will be of stone, and the style will be Decorated Gothic. The plans show a wide nave, with narrow aisles and chancel, and in the north aisle there will be an organ chamber, and in the south a choir and clergy vestry. There will be placed at the west end a window in commemoration of the Jubilee year. The structure is expected to cost £4,000.

A boys' modern school is about to be erected on the grounds at the rear of the Mechanics' Institute at Leeds. The building will have a frontage to Rossington-street of about 100ft., and to Percival-street of 70ft., the architecture harmonising with that of the institute. On the ground level will be a covered playground, and above this there will be three stories. The first floor will be divided into classrooms, five in all, and the head-master's room. The second floor will comprise a lecture theatre, 39ft. by 39ft., an apparatus room, a room for physics and mechanics, and a classroom. On the third floor will be a laboratory, 64ft. by 41ft., balance-room, metallurgy room, and storeroom. The new building will cost £4,000. The plans have been prepared by Mr. C. S. Nelson, of Leeds.

The parish church of Lanhydrock, Cornwall, is about to be restored and reseated at a cost of about £2,500, borne by Lord Robartes, whose seat it adjoins. Mr. G. Vialls, of Ealing, is the architect, and the tender of Messrs. Carah and Edwards, of Crowan, near Cambourne, has been accepted for the execution of the work at £2,388 10s.

LEGAL INTELLIGENCE.

AN ARCHITECT'S CLAIM. — At the Ryde County Court on Wednesday week, the case of "Webber v. The Royal Hotel Company, Ventnor," was heard by Judge Leonard. Mr. T. White for the plaintiff, and Mr. Poole, of London, for the defendants. The plaintiff, who is an architect at Ventnor, claimed £23 4s. for services rendered in preparing plans for a greenhouse, &c. The defence was that the charge was excessive, that plaintiff had carried out the work in a very loose way, and that the structure did not answer the purpose for which it was intended. Mr. Stratton supported the plaintiff's charges, and said the work had been carried out in a proper manner; but Mr. Livesay, of Ventnor, stated that the charges were excessive, and the work not carried out as it should have been. His Honour gave judgment for defendants on a set off for £15, which leaves plaintiff £8 7s. of the amount sued for.

CHUBB'S PUSH AND PULL LOCKS.—On the 8th inst. an interlocutory application was made on behalf of the plaintiff in the case of Kaye v. Chubb to the Master of the Rolls (Lord Esher) and Lords Justices Lindley and Lopes for a stay of proceedings in the action pending an appeal to the House of Lords. When the action was tried, Mr. Justice Mathew decided in favour of the plaintiff, but in the Court of Appeal their Lordships gave judgment with costs in favour of the defendants, Messrs. Chubb, lock and safe manufacturers. The plaintiff having entered a further appeal to the House of Lords, now applied for a stay of execution pending the result of such appeal. After hearing the arguments, however, their Lordships refused the application with costs.

RATEABILITY OF ADVERTISING HOARDINGS.—In the appeal of "Taylor, Garrett, Evans, and Co. v. the Overseers of Pendleton, Lancashire," heard before Mr. Justice Wills and Mr. Justice Grantham on Monday, the question was raised, not for the first time, whether hoardings erected for advertising purposes are rateable. In 1883 the proprietors of a timber yard entered into an agreement with Messrs. Taylor and Co. to allow them for three years the privilege for erecting on their premises a hoarding for the purpose of advertising, at a rent of £30. For this Taylor, Garrett, and Co. were rated, and they appealed against the rating, and the sessions relieved them, but stated a case, which was now argued. The case of "Willing v. the Assessment Committee of Pancras" (2 Law Reports, Q.B., 258) was cited. The Court came to the conclusion that the agreement gave the appellants the exclusive occupation by their hoarding of the land on which it was erected, and so it was rateable as in their occupation, and thus their appeal ought to have been dismissed. Judgment accordingly.

THE CHARGE OF ARSON AGAINST AN ARCHITECT.—At the Carnarvonshire Assizes on Wednesday, before Mr. Justice Denman, Abraham Henthorn Stott, a mill architect, having an extensive practice at Manchester, was indicted for firing his dwelling-house at Pensychnant, Conway, upon which there were insurances amounting to about £10,000. The defence was that the prisoner was not responsible for his actions. The jury, after being locked up for four hours, acquitted the prisoner, on the ground that there was no proof that he attempted to set fire to the place.

At the last meeting of the French Académie des Sciences, M. Bertrand read a report upon the Gallic cemetery recently discovered at St. Maurles-Fossés, near Paris, by Mr. Ernest Macé, who has presented most of the objects discovered there to the Museum of National Antiquities. These objects are identical with those found hitherto in the departments formed of that part of Gaul which Cæsar allotted to the Belgians. Most of the tombs had been walled round to a height of from 12in. to 14in. to keep back the sand at the sides, and the body is placed immediately upon the sand and covered with a row of large flat stones. In every case the bodies are laid with the face upwards, the sword in the right hand, fastened by a jointed iron belt. On the right-hand side is the point of a lance, the handle of which is placed between the legs.

Mr. James Anderson, formerly of the firm of M'Coll, Anderson, and Co., engineers, of Melbourne, has completed the construction of an enormous floating dock at Sydney, capable of taking in the largest sailing ship afloat. It is 320ft. long, 57ft. wide, and 26½ft. deep, and has a displacement of 14,500 tons. It has been christened the "Victoria Jubilee Floating Dock." The structure is entirely of colonial workmanship.

Almost simultaneously with Mr. John Aird's taking his seat as member for North Paddington the *London Gazette* notifies that the Queen has granted the dignity of a Baronet of the United Kingdom to Mr. Aird's partner, Thomas Lucas, of Ashted Park, Surrey, and of Lowestoft.

WATER SUPPLY AND SANITARY MATTERS.

BOURNEMOUTH. — The Local Government Board have granted their sanction to the loans for the following works—viz., £9,000 for scheme for watering the roads and flushing the sewers with sea-water; £5,500 for the construction of a storm outfall; £1,750 for private street improvements; £320 for additions to stabling; and £2,500 for public conveniences for ladies and gentlemen.

MANCHESTER.—The Manchester City Council received and adopted on Wednesday a report from the Rivers Committee respecting a scheme they had drawn up for dealing with the sewage of that city. Under the scheme brought forward by the committee a system of filtration will be followed, the effluent to be passed on to lands to be acquired by the Corporation, and so absorbed. The cost of the scheme is set down at £412,000. A Local Government Board inquiry respecting the application to borrow the proposed sum is to be asked for.

PURIFICATION OF THE WATER OF LEITH. —A report has just been issued by Professor Crum Brown and Mr. Robert C. Reid, C.E., on the purification of the Water of Leith, under a second remit from the local authorities of Edinburgh and Leith, the interested parishes, and the manufacturers on the water. The principal suggestion of the report is that an intercepting pipe should be constructed from Balerno downwards, to collect all the discharges from the mills and sewers now sent to the river. It is pointed out that the discharges might be treated at purification works outside Edinburgh, and again sent to the river; but though this system would meet the requirements of the Rivers Pollution Act, the river would not be restored to the purity which characterises it above Balerno, and to obtain this purity the pipe might be continued to the sea, or joined to the existing Water of Leith pipe, below Coatbridge. In order to provide for the water which would be withdrawn from the river by such a scheme, it is also explained that an additional storage system might be adopted, either by raising the embankments of the existing compensation reservoirs of the Water Trust to retain the water that overflows during winter, or by constructing an additional reservoir on the Water of Leith below Harperrigg.

ST. GEORGE'S EAST WORKHOUSE.—The report of the Local Government Board inspector (Dr. Bridges) upon the recent additions to this establishment has been laid before the guardians. It states that the new workhouse block (Messrs. Wilson, Son, and Aldwinckle, architects) is all that can be desired as regards drainage, warmth, and ventilation, which is on the Boyle system. On the occasion of Dr. Brydges' visit the workhouse was full of people, but the air was remarkably pure. The report was referred to the house committee for consideration.

CHIPS.

The most sensible thing in connection with the Jubilee was done by Messrs. Dennett and Ingle, of Whitehall, who (as will be seen from a notice elsewhere), being worried to death by something short of a thousand applications from "friends" for some sixty or seventy seats, let their rooms, and devoted the proceeds (over 100 guineas) to several deserving hospital charities. A capital idea; we shouldn't mind a Jubilee, say, once in 25 years, if the example set could be followed with similar success.

It has been decided to complete forthwith the tower and add new classrooms to the Congregational church in Oxton-road, Birkenhead, from designs by the architect of the church, Mr. T. W. Cubbin, of Hamilton-square, Birkenhead.

The tender of Messrs. Parnell and Son, of Rugby, has been accepted at £26,536, for the erection of the new Nonconformist Mansfield College at Oxford. Mr. Basil Champneys, B.A., is the architect.

A chancel and transept are about to be added to St. Luke's Church, Woodside, near Croydon, at a cost of £3,000. Messrs. Mullins are the architects, and Mr. Marriage, of Croydon, is the builder.

Damage to the extent of many thousands of pounds was occasioned on Sunday night by a fire which broke out at the extensive timber yard of Messrs. Calder, Dixon, and Co., Commercial-street, Middlesbrough.

The Numidian Marble Company seems to have a valuable investment to offer. The marbles of Kleber, in Oran, which the company is going to work, are very durable and beautiful, and the supply is practically inexhaustible. Mr. Norman Shaw, Mr. H. R. Gough, and Mr. Ruskin speak highly of the marbles, and Mr. C. J. Phipps is on the directorate. The capital asked for is only £200,000 in 32,000 ordinary shares of £5 each, and £40,000 in 5 per cent. preference shares of £100 each.

Our Office Table.

MR. JOHN WRIGHT OAKES, A.R.A., the landscape painter, died on Friday last at his residence, Leam House, Addison-road, Kensington, after an illness which had incapacitated him from the exercise of his profession during the past six years. Mr. Oakes, who was the son of a house painter, plumber, and glazier in Parker-street, Liverpool, first exhibited at the Academy in 1848, when he was 26 years of age, and continued to send pictures to the Academy, the British Institute, and the Suffolk-street Gallery, which were accepted year by year till 1880; but recognition of his talents came to him rather late in life, as he was not elected an Associate of the Academy till 1876, when he was 54 years old. Soon afterwards his health began to fail, and his later works show evidence that his labours were pursued with increased effort and diminished success. Examples of Mr. Oakes's landscapes are hung in the modern collections at South Kensington, "Early Spring Twilight"; Liverpool, "Autumn"; and Glasgow, "Early Spring," the two latter being of his best period. Two of his works "The Last Gleam" and "Glen Muich, Aberdeenshire," appear on the walls of the Royal Jubilee Exhibition at Manchester.

THE plan prepared by the officials of the Metropolitan Board of Works for widening the neck of Charing Cross-road by setting back the steps of the portico of St. Martin's-in-the-Fields Church, so as to isolate each column, the new steps being made between them, is meeting with some adverse criticism. Mr. William Butterfield condemns the proposal as ruinously disfiguring the church, and suggests that the only plan by which the increased width could be given would be by setting the portico inwards by half its width, when the steps and platforms would follow it. This proposal agrees with one of the three alternative designs prepared for the church by Gibbs, and would add 12ft. to the width of the road. Mr. Beresford Hope protests against the Metropolitan Board's proposal, which he successfully opposed in the House some years since, and the Rev. E. C. Hawkins declares that the project is needless as the road is wide enough for all ordinary traffic.

MR. JOHN AIRD, of 14, Hyde Park-terrace, and of Sutton, near Staplehurst, Kent, who has been elected M.P. in the Conservative interest for North Paddington, is, the *Times* remarks in a biographical notice of new members, the son of Mr. Aird who founded the well-known firm of contractors that bears his name; he is also a partner in that of Messrs. Lucas and Aird, of Great George-street, Westminster. He is about 50 years of age, and now enters Parliament for the first time. His firm constructed the Millwall Docks in partnership with the late Sir John Kelk, and they have been largely engaged in constructing gas and water works in many foreign capitals and cities; and they are understood to be the contractors elect for the Manchester Ship Canal. Mr. Aird is married, and has a numerous family.

THE remains of Peter Courtenay, successively Bishop of Exeter and Winchester, were on Thursday placed in the tomb in Winchester Cathedral, prepared for their reception under the supervision of the Dean. Bishop Courtenay died in 1492, and until his coffin was found by Dr. Kitchin in the crypt of the cathedral no trace of his remains or place of interment were known to exist. The site of the new tomb is on the south side of the nave, close by the altar rails, and immediately facing the tomb of Bishop John de Pontisara, with which it is in harmony. The design is Perpendicular in style, the work of Mr. G. H. Kitchin, son of the Dean, who has also supervised the details of the erection throughout. The tomb is of Caen stone, the carving on which is by Mr. Whitley, sculptor, of London. The leaden covering of the original lid of the coffin, 6ft. 7in. in length, on which runs a cross nearly the whole length with the arms of the Courtenay family at the bottom, has found a fitting place on the top of the tomb, around which is placed an inscription in the stone. As the tomb stands against Bishop FOX'S screen, only three sides are seen, and these are ornamented with panels containing armorial bearings and other devices and symbols taken from the mantelpiece placed by the Bishop in his palace at Exeter, where it is still to be seen.

A REPORT is to be presented to the Metropolitan Board of Works to-day (Friday), submitting, in pursuance of a resolution of the Board passed so long since as the 3rd December, 1886, a statement of the facts connected with the letting of the land at Piccadilly-circus. The committee report the result of an investigation which the committee has made into matters arising out of the above reference, and states that, "in the opinion of the committee, Mr. Robertson, of the Architect's Department, has been injudicious in allowing relatives to become tenants of the Board without informing the Board; but that the committee does not find that there has been anything worthy of more severe censure." Two amendments will be moved to this recommendation. The first, set down in the agenda by Mr. Mossop, is—"That, in view of the circumstances disclosed in the statement submitted by the committee, the Board regrets to be unable to come to any other conclusion than that it is inexpedient that Mr. T. J. Robertson should remain in the Board's service; and that he be dismissed accordingly." The second, by Mr. Price, is less severe, but equivalent in effect—viz., "That in the opinion of the Board the conduct of Mr. Robertson, as detailed in the report of the Works and General Purposes Committee, has been such as to render it undesirable that he should remain in the service of the Board."

A MEETING of the Glasgow Master Plumbers' Association was held in the Waterloo Rooms on Thursday evening, 7th inst., to consider the question of the registration of plumbers, Mr. Alex. Brown, president, in the chair. Mr. Brown read communications on the subject from the secretary of the Worshipful Company of Plumbers, London, explanatory of the matter. Mr. Brown then called upon Mr. W. P. Buchan, who had been connected with the movement since its commencement in London in 1884, to give some information as to its working and present position. Thereafter Messrs. Wright, Barrie, and Rattray expressed their approval of the proposed system of registration of duly-qualified plumbers. The Chairman then moved that this meeting of the Glasgow Master Plumbers' Association approve of the proposal for the registration of plumbers, and the motion was carried unanimously. Mr. McFeat proposed that a committee be appointed to get further information upon the subject, and report to a future meeting. This was agreed to, and a committee duly appointed.

SIR HERBERT SANDFORD telegraphs from Adelaide, S.A., as to the Jubilee Exhibition in that capital, that the Fine Art Galleries are well lighted and that all the buildings are in a good forward state, and much addition has been made in consequence of the numerous further applications for space. There are now a northern annexe, a machinery hall, an agricultural hall, and an armoury, all in addition to the original permanent building with its two annexes. The arrangements for lighting all the buildings by the electric light are very good, and promise to be very successful. The British exhibitors are well in advance of all others. Special vans were sent down to Port Adelaide to convey the fine art works to the exhibition.

AN international exhibition of science and industry is to be held at Brussels from May to October in next year, under the patronage of the King of the Belgians. Premiums will be awarded in cash, medals, and diplomas, amounting in value to 500,000 francs. Subdivision 40 of the exhibition consists of (*a*) civil engineering and public works, (*b*) architecture, and (*c*) materials of construction. The president of the committee of this subdivision is M. Theodore Lamal, of Brussels, engineer-in-chief of bridges and highways; M. Wynand-Janssens, of Brussels, and M. Louis Berger, of Schaerbeck, architects, are the vice-presidents; and the secretaries are Messrs. Desaunois and Joniaux, of Brussels, and Jean Laurent Hasse, of Antwerp. It is announced that a million francs' worth of the articles exhibited will be bought for premiums in the lottery authorised by the Belgian Government. All information will be given to inquirers by Count d'Oultremont, the General Commissioner of the Government, 11, Place de Louvain, Brussels.

A USEFUL group of circulars has just been issued for the recently-established Emigrants' Information Office, 31, Broadway, Westminster, for the guidance of those desirous of emigration, and anxious to ascertain what colony they should select. The circulars, ten in number, deal with the colonies of Canada, Australia, and South Africa, and give fares, length of voyage, conditions of assisted passages, facilities offered for acquiring land, and the kind of persons likely to succeed. These circulars, each of which deals with a separate colony, are sent for distribution to every post-office in the United Kingdom, where they may be obtained gratis, and each is expanded into a penny handbook. The Canadian circular states that in the Dominion there is no demand just now for mechanics, and that emigrants must be prepared to take to other work than that of their particular trades; the building trades are slack during winter. The wages of carpenters range from 1·25dols. to 2dols. per day in the Eastern provinces, and those of bricklayers from 2·25 to 3dols., the rates being much higher in British Colombia and the North-West Territories. In New South Wales the rates of wages per day of eight hours, without board and lodging, are for bricklayers, 11s. to 12s.; carpenters, 9s. to 12s.; gasfitters, 10s. to 11s.; plumbers, 10s. to 11s.; and stonemasons, 11s. to 12s.; while brickmakers earn from 22s. 6d. to 30s. per 1,000 bricks. In Victoria and Queensland the wages, as given in the circular, range about 10 per cent. lower, and in South Australia, Western Australia, and Tasmania, 25 per cent. lower; while in New Zealand the rates closely approximate to those of New South Wales. In Cape Colony, plumbers are paid from 10s. to 12s. per day; carpenters, 6s. 6d. to 10s.; bricklayers, 6s. to 10s.; painters, 5s. to 9s.; and builders' labourers, 3s. to 5s.; and in Natal the rates are somewhat higher, the wages quoted being: blacksmiths, 11s. per day; cabinet makers and joiners, 10s.; bricklayers and carpenters, 9s.; and grainers and writers, 8s. The pamphlets seem to be carefully drawn up, and will well repay attentive study by any who may be dissatisfied with their lot in England.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Society of Architects. Visit St. Cuthbert's Church, Philbeach-gardens, at 2.30 p.m. (nearest station, Earl's Court), and to St. Paul's Church, Hammersmith, at 3.30 p.m., conducted by Mr. H. R. Gough, Past-President.
St. Paul's Ecclesiological Society. Day visit to Salisbury. Train from Waterloo (7s. 6d. return), 9 a.m.

THURSDAY.—Builders' Benevolent Institution. Annual meeting, Willis's Rooms, 3 p.m.

Trade News.

WAGES MOVEMENTS.

EDINBURGH.—At a well-attended meeting of joiners held in the Good Templars' Hall, Edinburgh, on Monday night, it was resolved to request from the employers an advance of ½d. per hour on the present rate of wages, which is 6½d. an hour.

CHIPS.

A memorial church is about to be built at Clifton, near Rotherham, from plans by Mr. E. J. Hubbard, M.S.A., Moorgate-street, Rotherham.

A committee of the town council of Wolverhampton has recommended to that body the adoption of a scheme for improving the sewerage of the borough prepared by Mr. Berrington, and estimated to cost £8,000.

A labourer named Harding, employed on the building of a new Baptist chapel, Northcote-road, New Wandsworth, on Monday was seized with a fit, and fell from a scaffold. The height from the ground was only 3ft., but his neck was broken, and death was instantaneous.

At a meeting of the Birmingham Tame and Rea District Drainage Board, held on Tuesday, it was resolved to apply to the Local Government Board for sanction to borrow £20,000 for drainage, levelling roads, and other purposes.

CHIPS.

The restoration at Wincanton parish church has been commenced, and a considerable number of men are at work upon the interior, whilst others are levelling, preparatory to laying the foundation of the new edifice. The whole edifice, with the exception of the tower, is to be pulled down and reconstructed at a cost of nearly £6,000. Mr. Millward, of Cardiff, has been appointed clerk of the works. The architect is Mr. J. D. Sedding, of London, and the contractor is Mr. Vallis, of Frome, Somerset.

A collection of pictures formed by the late Mr. Roupell, Q.C., was sold by Messrs. Christie last week. It consisted chiefly of works by the old masters, none of which, however, could be deemed of great importance. Mr. Doyle bought for the National Gallery of Ireland a Camp Scene, with soldiers halting at a sutler's booth, for 255 guineas. Mr. Doyle also acquired for the same collection a landscape with state carriage drawn by four horses, with attendants and pages, by Jacob Ruysdael and De Keyser, the price paid being £399.

In our notice of the additions to the National Gallery last week, although we mentioned the portrait-heads of the painters—Rubens, Rembrant, Titian, Raphael, Leo da Vinci, and Correggio—we omitted to give the name of Mr. C. H. Mabey as the sculptor. He also executed the ornamental modelling to the vestibule under the direction of Mr. John Taylor, architect, of H.M. Office of Works.

Holloway's Ointment. — Go where you may, persons will be found who have a ready word of praise for this Ointment. For chaps, chafes, scalds, bruises, and sprains it is an invaluable remedy; for bad legs, bad breasts, and piles, it may be confidently relied upon for effecting a sound and permanent cure.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, three stamps, post free.—LESSER, FRIEDLANDER, Tobacconists' Shop Fitter, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

BEST BATH STONE.

FARLEIGH DOWN, CORSHAM DOWN, BOX GROUND, COMBE DOWN, WESTWOOD GROUND. STOKE GROUND.

RANDELL, SAUNDERS, & CO., LD.,
CORSHAM, WILTS.

BATH STONE.

PICTOR and SONS, BOX, WILTS.

NORTH'S IRON BUILDINGS,

From National Agricultural and Colonial Exhibitions.

All Sizes, SALE or HIRE; and Sheets; also from Railways, and New Soiled.
IRON CISTERNS, all sizes, cheap.
LONDON ROAD, SOUTHWARK.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE,

Greater facilities have been provided for working these Quarries, and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

WM. OLIVER & SONS,

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BOURTON, SOMERSET.—For new laundry, for the guardians of Bedminster Union. Mr. A. J. Sharp, engineer and surveyor:—

Builders' work:—

Child, J., Bourton	£360 0 0
James, J.	349 0 0
Hayes, C. A.	286 0 0
Beaven, A. J.*	280 0 0
Bastow, J.	275 0 0

For fittings:—

Llewellyn and James	278 15 0
Childs, J., Burton	270 0 0
May, J. B., London	240 0 0
Leary, J. S.	235 0 0
Beaven, A. J.*	230 0 0
Pope, W. J.	215 0 0

* Accepted. Rest of Bristol.

BRIXTON, S.W.—For the erection of a pupil teachers school in Hackford-road, Brixton, for the London School Board. Mr. T. J. Bailey, architect to the board:—

Higgs, F. and H. F.	£7,360 0 0
Leslie and Knight	6,698 0 0
Downs, W.	6,671 0 0
Stimpson and Co.	6,570 0 0
Holloway, J.	6,450 0 0
Wall, C.	6,450 0 0
Holloway, H. L.	6,390 0 0
Johnson, W.	6,350 0 0
Hart, H., Great Dover street, Southwark (accepted)	6,230 0 0

BRIGHTON.—Alterations to Nos. 98 and 99, George-street, for Messrs. Crouch, Stevens, and Gardner. Messrs. Fuller and Oakden, Eastbourne and Lewes, architects:—
Kemp, C., Brighton (accepted).

BROADCLYST.—For dwelling-house and outbuildings at Younghayes Farm, for Mr. T. E. Bidgood. Messrs. J. W. Rowell and Son, Newton Abbot, architects:—

Phillips, H., Exeter	£810 17 10
Luscombe and Son, Exeter	800 0 0
Scadding and Son, Exeter	710 0 0
Granger and Son, Whimple*	623 9 0

* Accepted.

CANTERBURY.—For new premises in St. Margaret's-street, for Messrs. Pool and Son. Messrs. Cowell and Bromley, Cathedral Precincts, Canterbury, architects:—

Gaskin, J. C.	£1,925 0 0
Adcock, W. J., Dover	1,890 0 0
Gentry, W.	1,799 0 0
Cozens, W.,	1,789 0 0
Wiltshier, J. E.	1,717 0 0
Wilson, H. B.	1,689 0 0
Judges, W., Boughton	1,573 0 0
Martin, W., Ramsgate (accepted).	1,583 0 0

Rest of Canterbury.

CLERKENWELL.—For the laying down of footways and executing other works in a proposed new street between Clerkenwell-road and Laystall-street, for the Metropolitan Board of Works:—
Mowlem and Co. (accepted) ... £2,489 0 0

CROYDON.—For alterations and additions to stabling at the Homestead, Bedford Park, Croydon, for Mr. A. Walton. Mr. C. Henman, 64, Cannon-street, E.C., architect:—

Maides and Harper, Croydon	£682 0 0
Goulder and Glasscock, Croydon	671 0 0
Smith, J., and Sons, Norwood	647 0 0
Garlick, J., London	616 0 0

EASTBOURNE.—For alterations to No. 8, Cornfield-road, for Mr. Elston. Messrs. Fuller and Oakden, Lewes and Eastbourne, architects:—

Gravett, G., Eastbourne	£132 0 0
Noakes, J., Eastbourne	105 0 0
Dore and Son, Eastbourne	97 10 0
Martin, M., Eastbourne (accepted)	87 12 0

EASTBOURNE.—For alterations to No. 13, Ashford-road, for Mr. T. A. Provost. Messrs. Fuller and Oakden, Lewes and Eastbourne, architects:—

Martin, J.	£142 0 0
Martin	141 0 0
Dore and Son (accepted)	88 0 0

EDINBURGH. — For carrying out improvements in Saunders-street, for the city council:—
Henderson, Matthews, and Co. ... £184 18 7
(Accepted.)

EDINBURGH.—For the demolition of old premises, Nos. 1, 3, 5, and 7, Canongate, for the city council:—
Waddell, A. (accepted) £50 10 0

GATESHEAD.—For two houses in Derwentwater-road, Gateshead, for Mr. M. Turner. Mr. G. W. Caris, 16, West-street, Gateshead, architect:—

Haswell and Waugh	£480 0 0
Greason Bros.	460 0 0
Briggs, F.	455 0 0
Henderson, F., Low Fell	440 0 0
Wakefield, F.	430 0 0
Greetham Bros.	430 0 0
Watson, T. (accepted)	380 10 0

Rest of Gateshead.

GIPSY HILL.—For new wing and additions to the Bungalow, for Mr. H. H. Macleod. Mr. M. N. Inman, 7, Bedford-row, W.C., architect:—

Poole, W.	£477 10 0
Fox, W.	476 0 0
Hitchcock, J. (accepted)	469 15 0

GLENFARG, N.B.—For the construction of the Glenfarg railway, for the North British Railway Co.:—
Brand, C, and Son, of Glasgow (accepted).

GRIMSBY.—For the erection of a factory for the Grimsby Fish Biscuit Company, Limited. Mr. E. W. Farebrother, F.R.I.B.A., architect:—

Smith, W. H.	£2,090 0 0
Roebuck and Cooseman	1,808 0 0
Guy, J. and R. G.	1,750 0 0
Riggall and Hewins	1,657 10 0
Siminson, T. (accepted)	1,590 0 0

GREENOCK.—For the erection of the new station:—
Watt and Wilson, Glasgow (accepted).

For boiler setting, &c., and extra timber for foundations:

Siminson, T., and Marrows, H.*	217 0 0

For fencing in site:—

Riggall and Hewins	£99 10 0
Marrows, H.*	97 0 0
Chapman, J.	70 0 0

* Accepted.

GRIMSBY.—For additions to Holme Hill schools, for the Grimsby School Board. Mr. E. W. Farebrother, F.R.I.B.A., architect:—

Roebuck and Cooseman	£293 5 8
Guy, J. and R. J.	290 0 0
Reggall and Hewins	274 0 0
Siminson, T. (accepted)	231 0 0
Walker and Cook	222 10 0

GRIMSBY.—For alterations and additions to Spring Church schools, for the trustees. Mr. E. W. Farebrother, F.R.I.B.A., architect:—

Emerson, W. H.	£389 0 0
Roebuck and Cooseman	376 0 0
Kirk, N.	372 0 0
Swain, T.	366 0 0
Bells, G.	353 0 0
Siminson, T.	333 0 0
Grant, F. (accepted)	280 5 11

GRIMSBY. — For alterations and additions to the *Grimsby News* offices and printing works, for the directors. Mr. E. W. Farebrother, F.R.I.B.A., architect:—

Walker and Cook	£280 5 0

GRIMSBY.—For additions to the Co-operative Ice works, Grimsby. Mr. E. W. Farebrother, F.R.I.B.A., architect:

Nightingale and Danby	£580 0 0
Roebuck and Cooseman	488 0 0
Guy, J. and R. G.	480 0 0
Reggall and Hewins (accepted)	423 0 0

GRIMSBY.—For new shop, Victoria-street, for Mr. Drakes. Mr. E. W. Farebrother, F.R.I.B.A., architect:—

Roebuck and Cooseman	£101 2 6
Frank and Jagger	97 0 0
Nightingale and Danby	92 10 0
Marrows, H. (accepted)	72 0 0

GRIMSBY.—For additions to South Parade board schools for the Grimsby School Board. Mr. E. W. Farebrother, F.R.I.B.A, architect:—

Walker and Cook	£465 10 0
Roebuck and Cooseman	465 0 0
Reggall and Hewins	463 10 0
Guy, J. and R. G.	463 0 0
Thompson, G. E.	443 10 0
Siminson, T. (accepted)	435 16 0

HALIFAX.—For the construction of a new road from Siddal to Salterhebble, for the town council:—
Tyson, G. and H. (accepted) ... £2,378 0 0

HALIFAX.—For the extension of South-street from Prescot-street to Oxford-road, for the town council:—
Tyson, G. and H. (accepted) ... £624 0 0

HALIFAX.—For the supply of cast-iron gas-pipes during twelve months, for the gas committee of the corporation;—
Clapham Bros., Keighley (accepted).

HANDSWORTH, SHEFFIELD.—For the construction of an approach road to the Woodhouse Cemetery, for the Handsworth burial board:—
Sykes, H. (accepted) £170 0 0
(Lowest tender received.)

HORNSEY.—For street fire-station, for the Hornsey Local Board. Mr. T. de Courcy Meade, Assoc.M.I.C.E., engineer and surveyor:—

	Fire Station A.	Fire Station B.
Russell and Rosser, Charing Cross—	£222 0 0	£177 0 0
Kerry and Son, Highgate—	177 0 0	136 0 0
Holmes and Son, Highgate—	172 0 0	134 0 0
Dixon, Highgate—	165 0 0	140 0 0
Marks, Crouch End—	156 15 0	141 17 6
Keay, Birmingham—	105 0 0	130 0 0
Cutting and Co., Strand (accepted)—	95 0 0	80 10 0
Linzell, Bedford-row, W.C. (withdrawn)—	68 0 0	48 0 0

HORNSEY.—For caretaker's cottage at Irish Corner, for the Hornsey Local Board. Mr. T. de Courcy Meade, Assoc.M.I.C.E., engineer and surveyor:—

Smith and Sons, Muswell Hill	£487 0 0
Holmes and Sons, Highgate	469 0 0
Marks Crouch End	465 9 3
Wheeler and Co., North Finchley	458 0 0
Price, Brixton	403 0 0
Dixon, Highgate	397 0 0
King Bros., South Norwood	359 0 0
Kerry and Son, Highgate	350 0 0
Kessells, Highgate	349 0 0
Mattock Bros, Finsbury-park	345 0 0
Paine Bros., Stamford-hill*	323 19 11
Linzell, Bedford-row, W.C.†	315 0 0

* Accepted. † Withdrawn.

HOLLESLEY. — For additions to The Red House Hollesley, for the Colonial College and Training Farms. Quantities by Mr. C. H. Goode. Messrs. J. Giles, Gough, and Trollope, architects:—
Girling, Ipswich (accepted) 2,350 0 0

HULL.—For the erection of new schools in West Dock-avenue, for the school board:—
Marsden and Hodson (accepted)... £6,589 0 0

KNOTTINGLEY.—For the restoration and reseating of St. Botolph's Church. Messrs. Demaine and Brierley, of York, architects:—
Woolston, T., Stamford (accepted).

KNOTTINGLEY.—For the enlargement of Christ Church. Messrs. Demaine and Brierley, of York, architects:—
Woolston, T., Stamford (accepted).

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1698.
FRIDAY, JULY 22, 1887.

THE VESTIBULE AND HALL ARCHITECTURALLY CONSIDERED.

THE treatment of the vestibule has always been a *tour de force* with the architect. If he can impart to it size, he can give to an otherwise commonplace design a feature important enough to compensate for many shortcomings in plan; if he can dignify it by architectural pronunciation, he can often atone for other weaknesses of proportion and ornamentation. Except in buildings of important dimensions, or of civic and national character, the vestibule is rarely made a feature. Only in the larger class of residences can it be developed fully or made important enough to play a part in the external architecture. How very far inferior in the appointments are our modern ideas compared with those of the Romans. As they are revealed to us in the remains at Pompeii, the *vestibulum* led into the *cavædium* or atrium, which was surrounded by columns open to the sky, in whose centre was the compluvium or basin, which received the water from the roof. This apartment led by the *tablinum* into the peristyle, which was a portion devoted to the family. It was also surrounded by columns, but larger than the atrium. The domestic apartments inclosed these open courts. In the Roman villa, it must further be noticed, there were two parts, the public and the private. The porticus and the vestibulum, atrium and tablinum, belonged to the public portion, the peristyle and the surrounding apartments to the private portion. But the vestibule, the atrium, and the peristyle were arranged on one axis, and presented an elegant and inviting appearance to visitors. We have nothing to compare with this arrangement in our modern houses. With few exceptions our public buildings are destitute of the atrium and peristyle. The visitor to the Crystal Palace who has ever sauntered into the Pompeian Court will have realised, to his mind, a very fair and by no means exaggerated effect of the Roman villa, where the several parts we have referred to are shown to a full size scale with the addition of the mosaic and coloured decoration which contributed so much to the charm of the arrangement. Light and colour, parterres of flowers, translucent marble columns, drapery, fountains, and polychromy invited the visitor into the atrium or outer court. It was the reception room for all visitors; beyond it, screened off by drapery, was seen the inner court or garden, fresh with flowers and playing water. We are told by Pliny that the atrium was adorned with pictures, statues, and plate, and it was a waiting-room for clients. The atrium in Early Christian architecture was equally important. Most of the early basilicæ had the inclosed court, as that of St. Peter and the church of St. Sophia. Eusebius describes the latter as magnificent. These courts were surrounded by internal porticoes, and became, as Fergusson remarks, "a singularly pleasing adjunct to the façade, removing the church from the noisy world outside, and by its quiet seclusion tending to produce that devotional feeling so suitable to the entrance of a church." The narthex and the galilee, the last as we see at Ely and Durham, were derived no doubt from the Roman atrium, but we rather wish to dwell on the secular use of the feature.

The modern vestibule and hall are offshoots, though degenerate ones, from Classic times: often they are mere apologies, sometimes a square room with four columns and a blank wall behind, sometimes an opening with two columns to screen off the staircase from the outer vestibule. So long as there are columns, no matter how placed, the architect thinks he has created an impression upon the visitor. But to see what, after he passes them? Perhaps nothing but a very ordinary staircase, blank walls with commonplace doorways. The anticipation is rudely shocked at such an anticlimax of so promising a beginning. Disappointment is suffered, and is all the harder to bear because the imagination has been aroused to a high pitch. We imagine something beyond that is grander in decoration or scale—an inner hall, a court at once a fitting climax to the entrance hall, lofty, full of radiant light, or open above, and surrounded by colonnades or arcaded logias. St. George's Hall, Liverpool, the Royal Courts of Justice, London; and the Royal Exchange are examples of dignified arrangements, in which we pass from the lesser to the greater—from an outer vestibule to a noble apartment or a handsome cortile. Barry, in his Reform Clubhouse, Pall Mall, has given an admirable example of the Italian cortile arrangement. This grand hall in the centre of the interior is 56ft. by 50ft., and is surrounded by colonnades, Ionic below and Corinthian above; the roof is of diapered flint glass, and the floor tesselated. The staircase leads to the upper gallery, of the Corinthian order. In buildings of lesser importance the vestibule leads into the staircase hall, which may be a square or elongated apartment, adorned by columns or surmounted by a domical ceiling or skylight; sometimes it has a gallery round it. It is here the visitor imbibes his inspiration of the place, and it is here the architect should put his best art. Rather broad and dignified than lavish in ornament, the key-note of the prevailing treatment ought to be seen in the hall—whether it be of a private house or a public institution. The staircase ought to look an integral part of the hall, be divided or broken into flights, so as not to form a raking and unsightly feature as it very often does, a kind of afterthought placed against one or two adjacent walls of the hall. Architecturally considered, the very plain, raking soffit destroys all structural effect if allowed to predominate—one reason why a staircase hall on a small scale is generally so unsatisfactory. To produce agreeable effect, the horizontal lines of the steps or treads, ought to dominate. Masons, we know, like the spandrel step and raking stair soffit—they look lighter; but the architect prefers the steps to be left square or the undersides moulded on the soffit, a treatment generally adopted in important new buildings. But we need not say more on the staircase, except that it is one of the difficulties of artistic treatment when combined with a hall of small size. The vestibule is incomplete without an inner hall as the *pièce de résistance* in which the staircase may or may not be placed. Better, of course, if space allows, are recesses or lateral staircases on either side, allowing the hall to be free, these being separated by columns or arches in the form of an arcade from the main hall or corridor.

The advantage of placing the vestibule on the same axis as the hall is apparent, though we occasionally find violations of a rule so important as to be almost an axiomatic one. As an instance, an architect places his entrance tower and vestibule on the centre of the main façade, but disposes his inner hall on one side so that the visitor, after crossing the vestibule in a right line, would be diverted by a blank wall of corridor into the inner hall quite on one side. He would pass into the vestibule, take a right angle movement into a corridor, and pass to the inner hall through an arcade. A devious route or entrance is not always to be despised, however. For domestic and collegiate buildings we can find admiration in the indirect entrance. There is the pleasure created by expectancy—something to be revealed at each turn of our progress, the charm of indefiniteness as we thread our steps through vestibule and corridor into a well-lighted court or hall such as we meet with in many of the old colleges of the universities, at Hampton Court, and other places. There is a fascination in the intricate passages and vestibules of the old feudal hall, in the unravelled plot or plan. On this class of buildings we are not now engaged. Our object is to show that a skilful study of plan in the entrances of our public buildings is the avoidance of intricacy for its own sake, directness of approach, but so managed by an artistic concealment of bounds, by leading the eye out of the smaller into the greater, out of the plain into the more decorated, as to engage the visitor at every step; so the old peristyle of the Pompeian house led the guests, so the portico and pronaos led to the cella or the hypæthron.

The plans for the Imperial Institute show how architects differ in their treatment of the vestibule and hall. Mr. Collcutt has his main entrance leading to a tower vestibule square in plan, with four arches, two transversely leading to a corridor running lengthwise, and the axial opening leading to an inner hall or cortile and grand staircase, beyond which is an octagonal ante-hall to the reception hall; these are all in line with the entrance. The well-lighted cortile between the quadrangles is a feature that might be turned to good account, with lateral staircases separated by arcades. The portico, vestibule, and central hall in Messrs. T. N. Deane and Son's design are arranged with the object of increasing effect, the whole being axially disposed. Messrs. Aston Webb and Ingress Bell have a vestibule giving access to a square entrance hall divided by piers into nine compartments, the principal staircase in two flights ascending right and left beyond and forming a climax, a central entrance between the flights leading into the reception hall. Mr. A. W. Blomfield has a large octagonal entrance hall surmounted by a dome, a vestibule of the width of one side of octagon giving access to the reception room; these are axial. Mr. T. G. Jackson shows a tower entrance hall, but on one side of the inner hall. Dr. R. Rowand Anderson has observed an architectural gradation in his plan. Where the axial plan cannot be adopted, the architect has the choice of two alternatives. He may adopt a lateral inner hall, the staircases being arranged on either or both sides, with the main hall or apartment beyond, but centrally placed; or otherwise the vestibule may become the approach to a transverse corridor as we find at the Bolton Town Hall, and at the Manchester Town Hall. In both these buildings there is an opening in line with the axis of vestibule into the great hall, and in the latter instance the architect, Mr. Waterhouse, has succeeded in sustaining the effect by the lighted courts and bays on either side. To give interest and concentrated attention to the vestibule, the artistic architects have reserved their skill for the display of a well-lighted cortile or an open quadrangle as is the case of Somerset House. If this cannot be attained, an inner hall is the most promising of the means of securing the necessary vista. The imagination seeks for a continued revealing of beauty by a vista through a succession of varied courts or apartments, and is at once disappointed if a blank wall stops the way, beyond which there is nothing but barrenness and poverty.

TECHNICAL SCHOOL BUILDING.

LATELY we referred to the want of treatises on particular classes of buildings, and especially of those which have had

their origin during the last half-century, and we particularly dwelt upon the value of details of a technical kind or for a special purpose. The general spread of technical education has called for a new class of construction. The technical school, though known for many years in Germany, Austria, and other Continental nations, is comparatively a new institution in England, and when the promoters of technical instruction began to provide laboratories for physical and chemical instruction, they found English models of schools quite unsuited to their wants. Not only was it necessary to provide buildings on a different plan, but also to provide in their construction for requirements which were unknown to the old school builders. The systems, classification, and fittings of the polytechnic schools and Real-Schulen of Germany have been, more or less, introduced during the last few years ; and to the labours of Mr. A. Waterhouse, R.A., Mr. E. Hughes, Mr. E. N. Clifton, Mr. Henry Currey, Mr. E. C. Robins, F.S.A., Messrs. Mills and Murgatroyd, Messrs. T. N. Deane and Son, and others, we owe a class of buildings which may be regarded as types of structure to follow. Mr. A. Waterhouse, who was the architect of Owens College, Manchester, one of the earliest buildings of this class, fully illustrated in this journal, was one of the pioneers in this class of construction. He carried out a scheme of arrangement prescribed by Professor Sir H. Roscoe, the eminent physicist, and the chemical laboratories of this college continue to be models for the architect, and the medical school is also one of the most complete of its kind.

Mr. E. C. Robins, F.S.A., the author of a comprehensive treatise on the design and construction of buildings of this character,* has done good service in collecting and arranging for comparison several recent structures of this class, and in condensing a large amount of information on their construction and fitting up. As a member of the Executive Committee of the City Guilds, Mr. Robins accompanied Professors Armstrong and Ayrton in a tour of inspection of the polytechnic schools of the Continent. The results of this tour have been summarised. Mr. Robins describes and illustrates several of the more important, such as the Strasburg New University, the Conservatoire des Arts et Métiers, Paris, Professor Hofmann's chemical laboratories of Bonn and Berlin, the Munich University chemical laboratory, the Graz University chemical laboratory, the laboratories of the Royal Trade School, Chemnitz, the physical laboratory, Wurzburg, the Technical High School, Hanover, the Royal Technical High School, Stockholm, Sweden, the chemical laboratories, Zurich, &c. The author has thrown together, in a rather discursive form, observations on the advantages of technical education. As the architect of the Merchant Venturers' School, Bristol, and a member of the Executive Committee of the City Guilds, the knowledge and data he has acquired have been practically applied. Chapter I., which deals with English and foreign technical education, enters at some length into the rational methods of instruction. The author quotes at length from the Royal Commissioners' report on technical education, and gives an analysis of the second report in the following chapter, which is a valuable contribution. Nothing is more certain than the want experienced or good workmen in building ; but this has been brought about by the subdivision of the trades by specialisation of labour and the introduction of machinery. Skilful and artistic workmen have decreased, because a portion only of a trade has to be learned. By technical education in our schools we seek a corrective for this tendency. Few of our ordinary workmen now understand the principles of their trade or have rightly learned the proper adaptation of the materials they convert. English workmen are improving, no doubt ; but they are yet far behind the German in technical knowledge. Instruction in the use of tools and materials is of primary importance, and should be acquired in the elementary school. Fifteen years ago apprenticeship schools for workmen existed in Paris, and in the primary schools manual instruction is given. The author furnishes much useful evidence from professors of technology bearing upon the technical schools for workmen in Germany and Switzerland ; of these the *technikums* may be mentioned as the chief. The City and Guilds of London Institute is doing much the same for English working men, though it will be some time before the system is in working order or will give the results the schools do abroad.

The examples of foreign laboratories which the author has given will be found of value to promoters and architects engaged in school and college buildings, for, as we have hinted, the experience necessary in the design of good buildings can only be obtained by a study of foreign works. Mr. Robins has collected the data, and to some extent has formulated general principles. Chemistry and physics, mechanics, engineering, anatomy, and architecture necessitate specially-designed buildings, as these require laboratories, lecture and work rooms, drawing and modelling rooms. The rooms should be grouped upon some plan, and should be specially lighted, heated, and ventilated. The main laboratory and lecture rooms must form the centre of a chemical group of buildings ; the working benches for students, with sinks and draught closets, have to be arranged on the benches or along the walls. On the Continent separate laboratories for students of qualitative and quantitative chemistry are provided. At the Munich University the laboratory is divided into two parts, one for organic and one for inorganic chemistry, the former on the ground floor and the latter on the first floor. These laboratories are lighted on both sides, and have cross ventilation. Adjoining the former are a series of rooms for the director, and a combustion room. These are placed on each side of a corridor leading into the main laboratory. At the other end of it are conveniences, and a suite of living-rooms for assistants. In one of the laboratories (for beginners) one table is given to two students ; but in the advanced students' laboratory one table is assigned to each, and the laboratory for the former class accommodates 32 students, and for the latter 16. The floors are of wood with asphalte borders and gutters, 3ft. wide, on which are the wooden sinks and draught closets. The gutter carries away the water from sinks. The subordinate rooms given to this division include a room for heating sealed tubes (cannon-room), glass-blowing room, small combustion room, specimen room, washing-up room, in which is the hoist, a large combustion room at the end, and on the other side of corridor a large sink room with shaft, and a balance room. The private laboratory block: similar rooms are provided, with a consulting room and students' library adjoining the inorganic laboratory on the first floor ; the subordinate rooms comprise a filtration room, blowpipe room, melting and air-bath room, specimen room, washing-up room, stink chamber, balance rooms, sulphuretted hydrogen room, with other subsidiary rooms. A large square lecture-hall adjoins the latter block. The plan of the Physiological Institute, Berlin, is a good type of building of its class, with a central lecture-hall, instrument and assistants' rooms in front ; the first floor is arranged for chemical researches and spectrum analysis, and the second for optical and photographic work. For a technical school, the Royal Trade School, Chemnitz, appears to be well arranged in two balanced wings, with central block given up to grand staircase and teachers' rooms. The well-appointed Technical High School at Hanover has a very complete and architectural plan arranged round fine quadrangular courts, presenting a palatial appearance. A large space on the first floor is devoted to a series of lecture and drawing rooms for architecture and building, with inner corridor approach. These are divided into four classes of students. Rooms for building construction, models, technology, lectures, and collections occupy one ordinary wing ; mineralogy and geology, practical geometry, and mathematical instruments, with lecture-rooms in front of each, form the centre wings, and the department for physics and chemistry the extreme wing. On the ground floor are the engineering rooms below those for architecture and arranged similarly, and a very large space is given to drawing. The last plate illustrates the arrangement of another great school, the Royal Technical High School, Berlin, which cost £400,000. A chemical laboratory is by no means an easy building to plan. The larger the number of students, the more is it necessary to provide separate rooms for different kinds of work. Probably the most economical plan is a quadrangle with the rooms arranged round, as this plan shortens the distance and labour of superintendence. The Munich laboratories at the Academy of Sciences are planned on this principle. With regard to ventilation, descending extract flues have been provided. The draught closets, where all kinds of unpleasant odours are created, have flues carried up, and inlets for fresh air are introduced under the windows. The English examples include a few of the more important buildings. Of course, we have plans of the City and Guilds of London Central Institute at South Kensington, by Mr. A. Waterhouse, R.A.—a study deserving attention. The basement is occupied by rooms for delicate experiments in physics, in which vibration has to be minimised, mechanical workshops, joiners' shops, engineering, drawing, laboratory, &c. On the ground floor in front, physics is taught in one wing, including an optical laboratory, physics class-room, and engineering lecture-room ; and in the other wing are rooms for the engineering professor, lecture-room for mathematics, professors' rooms, and mathematical drawing room, all arranged along a corridor. In the rear are two lecture theatres, one for chemistry, the other for physics and mechanics, with preparation rooms in connection. The second and third floors are devoted to the chemical laboratories and class-rooms, the juniors' laboratory being on the third floor, behind. The Finsbury Technical School affords another good example of planning. Other plans are given of the Yorkshire College, Leeds, by Mr. Waterhouse ; the Merchant Venturers' School, Bristol, by the author—a good scheme, with a great hall ; the Manchester Grammar School Laboratory, by Mills and Murgatroyd ; Oldham School Laboratory, by Messrs. Woodhouse and Potts, Birmingham ; Mason's Science College, by Mr. J. A. Cossins—a cleverly arranged plan ; Medical School of St. Thomas's Hospital, by Mr. Henry Currey ; Owens College, Manchester, by Mr. Waterhouse ; Oxford Physiological Laboratory, by Messrs. T. N. Deane and Son ; and the Cambridge University Laboratory, by Mr. J. J. Stevenson. The chapter on fittings for applied science instruction will be found of service. Drawings to a large scale are given of students' working tables, with the mode of extracting the gases by flues below the tables ; sinks and draught closets in use at Manchester, and in the Finsbury College, Merchant Venturers' School, Bristol, and other institutions. In the chapters on heating and ventilation we find the author has adapted the formulæ and diagrams given in J. L. Bacon and Co.'s treatise. Chapter IV.

* Technical School and College Building. By EDWARD COOKWORTHY ROBINS, F.S.A. London: Whittaker and Co.

contains full descriptions of buildings for secondary educational purposes, and includes ink photos of South Hampstead High School for Girls, Milton Mount College, Gravesend; Walthamstow Hall, Sevenoaks Congregational Ministers' Boys' School, Caterham, and plans of elementary schools designed by the author. Mr. Robins's treatise, as the only comprehensive work on the subject yet published in England, is of value to the architect engaged in buildings of this class, and the plans and details add greatly to its practical usefulness.

THE EFFECT OF SEA-WATER ON CONCRETE.

THOSE who use Portland cement concrete will be interested in the discovery to which the *Scotsman* drew attention recently. It appears that the Aberdeen harbour seaworks have suffered considerably. The concrete blocks have been seriously affected by the sea, and the authorities have been rather puzzled to account for its destructive action. Very great reliance has been hitherto placed by engineers and architects on Portland cement concrete; but this good opinion has been somewhat shaken, if all that we hear of certain hydraulic works can be substantiated. We take our information from recent accounts that have come to us. Indications of failure have been observed for some time in important sea walls constructed of concrete, and the Aberdeen harbour works, if what we learn is true, confirm the misgivings which are entertained. The action of sea-water on concrete has been suspected of late years; but up to this time a satisfactory explanation of the damage sustained has not been given. Experiments have been recently made by direction of the Aberdeen authorities by Professor Brazier, of Aberdeen University, and Mr. William Smith, the harbour engineer. The decayed concrete has been ascribed to the force of the sea and wind, though the action was chiefly noticeable in the graving dock in still water. The writer in the *Scotsman* says: "It is the action of the sea-water under pressure in still water that has rendered the nature of the damage in the present instance so conspicuous." The quay walls and breakwater were constructed fifteen years ago, the graving dock two years ago, and in all these works a disintegration of the surface of the concrete by the chemical action of the salt water has been going on. The entrance walls are said to be built of Portland cement concrete, composed of one measure of cement, two measures of sand, and three measures of stones, with large rubble stones incorporated in the walls. The wall surface is plastered with Portland cement mortar up to 3ft. of low water, the mortar being made of one measure of Portland cement and one of sand; the upper part of wall is faced with granite. During the process of emptying the water from the graving dock, a hydraulic pressure varying with the tides of from 5lb. to 11lb. per square inch is put on this concrete skin, the water forcing its way through the pores of the skin, producing cracks and saturating the quay walls. The chemical action is hastened in proportion to the exposure, and is increased by the passage of water through the body of concrete. Various injuries are reported—*e.g.*, the joints of the ashlar facing have opened in parts, owing to the loosing of the concrete surface beneath. The engineer consulted Professor Brazier. Test briquettes were prepared for analysis with a view of discovering the proportion of magnesia contained, and which was supposed to account for the damage. The Portland cement, it was found, had not contained more than one-half per cent. of magnesia, whereas the decayed concretes showed an increase in the quantity of hydrate of magnesia of 13½, 15, 22, and in one case as much as 40 per cent. This could only have been derived from the sea-water. Another deleterious substance found in the decayed concrete was carbonate of lime, which could hardly be traced in the Portland cement of the same standard. The concrete taken from the south breakwater showed it to have undergone a similar chemical change. The outer quay walls surrounding the side of the graving dock were built of plastic concrete or Portland cement concrete, mixed in the usual way with a certain quantity of water, and allowed to set two to four hours, then broken up and deposited within frames under water in skips with opening bottoms, the concrete being left *in situ* in the frame. These walls do not show the same action or decay. Portions have been rebuilt with Roman cement concrete under water, but no decay has been noticed in them, and the only protection to the Portland cement concrete from the chemical action of the sea is apparently a non-porous lining or facing of stonework.

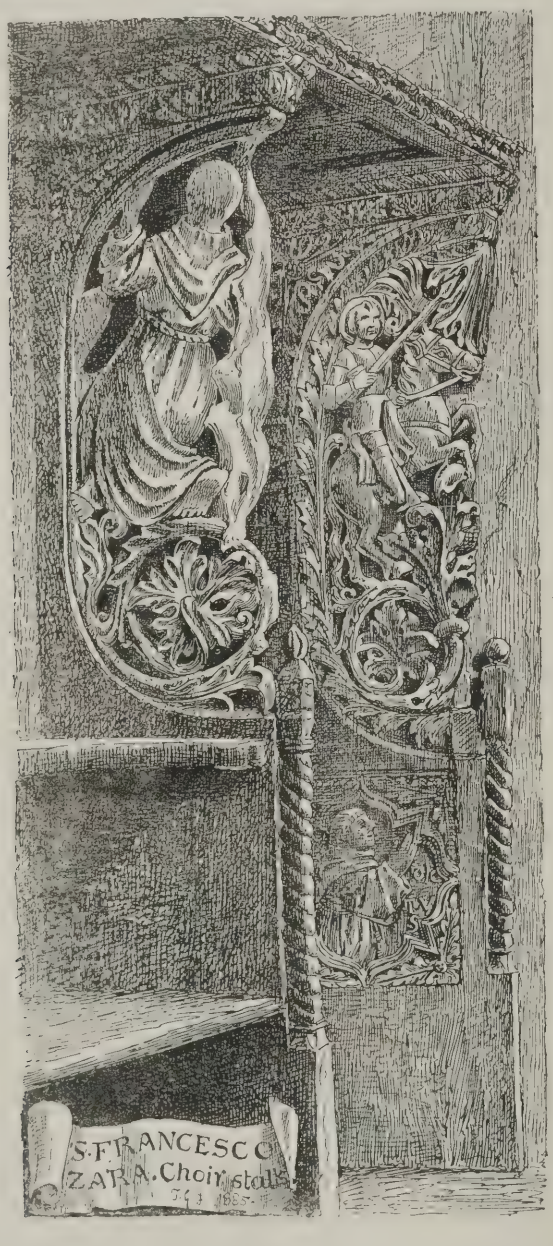
Every care is said to have been taken in the concrete used; the cement had withstood the mechanical tests, and the concrete had set hard. The same failure of Portland cement concrete was noticed by Mr. Harrison Hayter, vice-president of the Institution of Civil Engineers, two years ago. After a time the concrete expanded, vertical walls of the material lifted some inches, and the surface cracked and flaked off. In every case a white "cream-like" substance was observed in the concrete, which Mr. Hayter had analysed and was found to contain 80 per cent. of magnesia hydrate, consisting of about two-thirds magnesia oxide and one-third water. In every case of decayed concrete magnesia was present. Professor Brazier's experiments are confirmatory of the fact that these deposits of decayed cements contain magnesia, but he believes the substance comes from the action of the sea-water, and is not present in the Portland cement, as Mr. Hayter thought to be the case. We cannot enter into the details of the experiments made by Prof. Brazier on the cement blocks, and the results he obtained by digesting some of the cement in sea-water, from which it appears that the amount of lime and magnesia contained in the sea-water in its original state is accounted for after the cement had been separated from the water, there being a gain of lime and a loss of magnesia amounting to nearly all the magnesia contained in the sea-water. Hence the same authority concludes that Portland cement cannot resist the action of sea water.

TWO WEST-END CHURCHES.

THE members of the Society of Architects visited on Saturday afternoon two churches just built from designs by their past-President, Mr. H. Roumieu Gough—those of St. Cuthbert, Philbeach-gardens, Kensington, the new parish church of Hammersmith. The former church is now being roofed-in, while the nave of St. Paul, Hammersmith, was opened in 1885, and the chancel was reconsecrated on the 2nd inst. Mr. Gough accompanied the party, and explained the leading features of the buildings, both of which have been illustrated in our pages, St. Cuthbert's on Oct. 14, 1881, and St. Paul's on Aug. 27, 1880.

The interior of St. Cuthbert's Church, Philbeach-gardens, was not seen to advantage, as the centre is still blocked up by the unsightly iron structure in which services have been held for some years past. The church is built of red bricks, with Bath-stone facings, and consists of a nave and chancel 28ft. wide under one roof, and 125ft. in total length; the nave is of seven bays, and has north and south aisles, each 12ft. 6in. wide, with apsidal baptistery at west end. The church is lofty in its proportions, being 43ft. to springing of roof, 59ft. from nave floor to underside of barrel vault, and 62ft. to ridge. There is no tower, but the bell turret at the west end is carried to a height of 106ft. from ground, and over the chancel arch a flèche of woodwork covered with copper rises 72ft. above the ridge, or 134ft. from floor. The most novel feature of the church is the east front, which, although facing the street, contains no window, the space being occupied with two tiers of canopied niches, hereafter to be filled with statuary of Apostles and Fathers of the Church, the figures being somewhat over life-size.

The barrel vault to nave is groined with wooden ribs, and is bolted to an iron lattice girder roof, over which is a steep-pitched outer casing of common rafters and purlins covered with Imperial green slates. The aisles are divided from the nave by an arcade of clustered Devonshire marble columns carrying a lofty clerestory of double lights. On the south side of chancel is a morning chapel (separately roofed), and on the north side an organ chamber and vestry, with processional path, formed in the thickness of the walls behind the altar. In a crypt beneath these buildings and chancel are Sunday schools and parochial rooms. At the north-west angle is a residence for the vicar, the Rev. H. Westhall, with access to the church on the ground floor and by small west gallery. Messrs. S. Belham and Son, of Buckingham Palace-road, S.W., were the builders, and the Baron de Sziemanowicz, of Hurley-road, Kennington, executed the carving in this church, and also at St. Paul's, Hammersmith. The cost has been about £11,000.



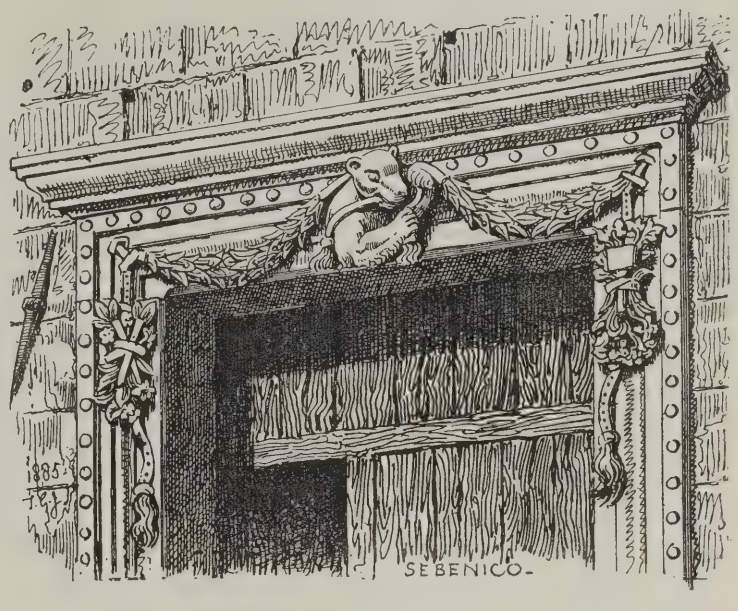
Having partaken of tea and coffee hospitably provided by the vicar, the visitors proceeded to inspect Hammersmith parish church. The new building replaces a smaller one consecrated in 1665. The older portion of church consists of a nave of six bays with side aisles, divided by an arcade of grey Bath stone resting on black Belgian marble pillars. The spandrels and internal masonry of the walls are of a warm sandstone from Ancaster, in courses left rough from the chisel, contrasting with the blue Bath of the archivolts, and the lighter dressed Box-ground and Corsham freestone of the clerestory. The clerestory is pierced by triplets of single light in each bay, and the ceiling is a plain pointed vault of plaster, with longitudinal, cross, and diagonal ribs on the face, decorated by stencilling, and supported by wall shafts of grey stone, resting on corbels. A semi-octagonal baptistery projects from the centre of nave at the west end. The new chancel, of the same width (30ft.), and height (45ft. 6in.) as nave, is two bays in length, with a morning chapel and aisle on the south side, organ chamber and vestry on the north, a choir vestry projecting eastward from the chancel, and communicating, ambulatory-like, with the chapel and vestry on each side of the sanctuary. The chapel is apsidal-ended. The piers separating the chancel from the adjoining aisle and organ-chamber are of black Belgian marble, which takes a good polish, with capitals and bases of the same material. There are sedilia on the south side of sanctuary, and the east end has a large three-light window, below which, behind the altar, the wall is divided into three compartments by an engaged arcade of black marble, plastered between, and decorated by stencilling. Round the sides of sanctuary and aisles is a dado of grey Leopold marble, the chancel and sanctuary and passages to nave all paved with Rust's glass mosaic, the risers of the steps being of marble. A dwarf perforated screen with moulded capping, all of Leopold marble, separates the nave from chancel. The ceiling of the new chancel forms a pointed vault plastered, with cross ribs springing from wall shafts between the clerestory windows. It is decorated with ornament up the ribs, and with a series of stencilled gables above the cornice the predominating ground colour being grey. The seats are carried out in a very substantial manner in teak, by Mr. John Lister, Aston, Rotherham. A large tower is in progress of erection over the end of north aisle or vestry, which is intended to have pinnacles at the corners. A pleasing contrast in tone is derived by the use of the warm Mansfield stone in the external walling with the Bath-stone dressings, and the replacement on the aisle walls of the tablets and memorials from the older church adds much to the internal effect. The nave and chancel are of the same height externally, and the church, when finished, will present a dignified appearance from the Broadway. The contractors are Messrs. Chamberlen Bros., builders, of Hammersmith, who have well executed the work, from the designs and under the supervision of Mr. Gough. Messrs. Jones and Willis supplied the iron fittings, and Messrs. Belham and Son, of Pimlico, the grisaille lights in the four lancets at west end.

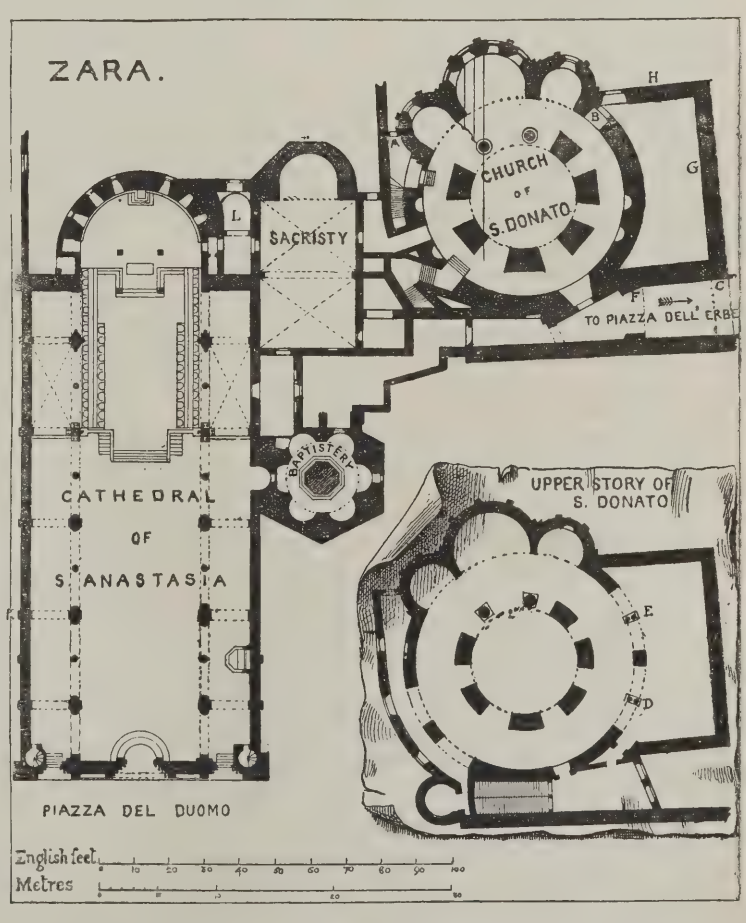
DALMATIAN ARCHITECTURE AND CROATIAN ART.

MR. T. G. JACKSON'S admirable work on Dalmatia* is distinguished by a freshness and undoubted thoroughness, which gives it an importance and interest of the first order; in fact, the history of architectural art has

* Dalmatia: the Quarnero and Istria with Cettigne in Montenegro and the Island of Grado. By T. G. JACKSON, M.A., F.S.A., Hon. Fellow of Wadham College, Oxford. Oxford: At the Clarendon Press, 1887.

received no more valuable addition since the days when Street published his "History of the Brick and Marble Architecture of Italy," or Sir Gilbert Scott printed his instructive lectures on the Dome and its Pendentive at the Royal Academy. In these days, when almost every style of building has been copied, adapted, and "revived," it is at least refreshing to find some less familiar phase of architecture so clearly and so cleverly brought before students of the art. Advocates of "a new style," changing once again their allegiance, have already stated that probably in the Dalmatian buildings as thus set forth for the first time will be found the elements for a development of the inevitable "new style." An increased knowledge of architecture and an extended





field of study alone can solve this problem, and so in this sense Mr. Jackson's book cannot fail to clear the ground for future efforts by informing us of many notable triumphs of the past hitherto comparatively unknown. Beyond this point we do not for a moment suppose he would follow those who profess to see in these drawings from Dalmatia a "new start" for architecture in its application to the everyday wants of the present time, and there seems indeed nothing in his book to favour such an assumption. Its pages are too busily occupied with historical information and descriptive particulars of the actual to enter upon so speculative and comparatively valueless a question as to what will or will not constitute a new style. The earlier part of the volumes is devoted to an almost complete description of all the architectural monuments of importance on the mainland of Dalmatia, the islands of the Croatian shore of the Quarnero, and the Litorale of Istria from Pola to Aquileja. To this is added an account of the Island of Grado, which is so intimately connected with Dalmatia as the metropolitan see of the Venetian dominion as to belong to the subject, although it differs from the Aquileja part of Istria. Grado is unknown to English art students save by report, and many of the places described by Mr. Jackson are certainly unknown to them even by repute. "Few persons," says our author, "have any idea of the beauty and extent of the art treasures of these countries, which indeed, so far as I know, have never before been explored from end to end by a professional student of architecture." The task thus referred to, no doubt, was a laborious one; and the several incidents of travel so graphically recorded in the pages before us give one a fair idea of the many difficulties of exposure and fatigue, sparse fare, and inadequate quarters which had to be overcome and encountered before the knowledge, not otherwise to be obtained, could be in any sense considered complete. Travelling in Dalmatia down the coast in the Austrian Lloyd's steamers is simple enough so long as the tourist is satisfied with a glimpse at the four or five chief towns which may thus be secured; but experience alone can tell the hardships to be undergone when once the beaten track is left by the traveller. That Mr. Jackson was well repaid for his three trips goes without saying, and all lovers of architectural art can but feel indebted to him for the unreserved way in which his studies and sketches have been placed before the public. His books are fully illustrated with plates and cuts. The subjects embrace not a few general views of towns and landscapes, costume drawings, and illustrations of church plate, furniture, and silversmith's work, in which Dalmatia is unusually rich. By the courtesy of the author and publishers, we are enabled to-day to present our readers with two plates, reproduced from Mr. Jackson's originals, which number among the illustrations of his work, and three of the letterpress blocks are here printed as typical examples of those which enrich his volumes.

To follow, however briefly, the history of Dalmatia through its four periods is quite beyond the limits of space at our disposal. These periods are divided thus—first, Dalmatia under the Romans and down to the fall of the Western Empire, A.D. 476; second, Dalmatia under the Byzantine Empire down to the arrival of the Hungarians, A.D. 1102; third, Dalmatia contested by Hungary and Venice down to the final Venetian occupation, A.D. 1409-1420; and, fourth, Dalmatia under the Venetians down to the fall of the Republic, A.D. 1797.. The materials for such a concise history can only be collected in the country. The works of local historians, of which there are many, only exist very often in MS., and even when printed seldom are found beyond the province. Then it is of prime importance for the writer to allow for the bias of politics, of creed, and race in a country where such feelings run so high as in Dalmatia. A most useful map of the islands and coast of the Adriatic, drawn to English and Austrian scale, prefixes the first volume. A review of the social condition of the country follows the historical *résumé*, and the chapter concludes with an account of the present state of the province. Added to this is a chronological table of the kings of Hungary down to 1526. Dalmatia, though nominally a kingdom, has never had any independent national existence, and even its geographical boundaries have been differently fixed by different writers and at different times. The natural scenery of Dalmatia is as singular as its geographical formation, and is in the strongest contrast to that of the opposite shores of Italy. The luxuriantly wooded mountains of Umbria, and the lagunes and marshes of Romagna and Venetia, are confronted in Dalmatia by stony deserts and mountains of arid whiteness which at the first view seem covered with new fallen snow; while the muddy sea that beats on the flat shores and harbourless coast of Italy is exchanged on the opposite side for sapphire depths of crystal clearness, which interlace the intricate network of natural breakwaters and penetrate into countless havens of matchless security. There are some few rivers of considerable size; but there are neither brooks nor springs, and most of the people have no water to drink but such as falls from the skies, and is collected in cisterns. In the interior the people and country both become ruder and less cultivated, and the place seems lost in a semi-barbarism. The architecture of Dalmatia has so much in it that is peculiar and distinctive that it is entitled to rank as a style by itself among the various national styles of Mediæval Europe. It is entirely urban and confined to the maritime cities, for the sea has in all ages been the parent of Dalmatian civilisation. The Slavonic conquerors gradually received the religion, and in a rude way imitated the art of the Byzantine Empire; but they never developed an art of their own, and the silversmiths' work which has been produced in purely Slavonic districts in modern times is but little removed from the Byzantine art of the eighth and ninth centuries. The maritime Dalmatians were brought into contact with the nations of Western Europe, and, above all, with Italy, their style being chiefly based on the Italian, though the Dalmatians cannot be described as mere copyists. Their artists, whether of the old Illyrian stock or, as their names imply, Slavs and Albanians, there is something about their work which reminds one of Northern Gothic, which it is suggested may be due to the influence of Hungarian rule, under which French and German artificers were possibly employed.

The first place naturally seen by the traveller on entering upon the Dalmatian soil is Zara,

by way of Trieste and Pola. It occupies a level peninsula, slightly raised above the sea, combining more advantages than any other of the Dalmatian ports, and which have caused it to be always strongly fortified. Behind, in the distance, are the mountains of Velebic on the left, and the mountainous island of Ugliano on the right. The Duomo resembles the Lombard Churches of Italy, and Zara is particularly rich in buildings of the earlier styles, chiefly used now, however, as haylofts and cellars. One exception to this rule is the Church of the Holy Trinity, known as St. Donato, which is not likely to be overlooked, though the building is not much seen from the interior of the town. From the distance, the lofty central drum with its pyramidal roof is the most conspicuous building that appears above the city walls. We print a plan of the sacred edifice, which during the past hundred years, has been put to a variety of uses. St. Donato is a round church of the same type as that of St. Vitale at Ravenna, and the Cathedral of Aix-la-Chapelle, though it differs from both in many particulars. It has a circular space in the centre surrounded by a circular aisle, and from the aisle three apses project eastward, of which the middle one is larger than the other two, and all three apses are vaulted at the level of the vaulting in the aisle. Above these apses and this aisle is an upper story like a triforium opening into the central space. The ascent to this upper church, as Constantine Porphyrogenitus called it, is by a stair which winds round the outer wall landing in a kind of atrium, from which the building is entered. Here the catechumens worshipped, and having a separate entrance at A on the plan, they could attend the services without mixing with the congregation. The construction of the church is very rude, and is equally plain inside as out. The central dome has now fallen in, and the space is covered with a wooden ceiling. The circular aisle opens into the central space by eight round arches, and is ceiled with an annular barrel vault which forms the floor of the upper gallery. The additional space opening into the main building by the arches D E made the gallery level worthy of the name of the upper church above the first. Bishop Donatus is thought to have built the edifice at the beginning of the ninth century, and under the foundations of this church have recently been found the huge fragments of more than one magnificent Classic building entablature with Corinthian enrichments, marble columns, and running scrollwork in the best style of Roman architecture — pride spiritual crushing pride temporal. St. Pietro Vecchio, St. Lorenzo, St. Domenica (a most interesting church), and St. Orsola, which is built on a plan resembling the ancient baptistery of the Duomo, are among the churches of Zara. The cathedral is dedicated to St. Anastasia, and its plan is given herewith showing a basilica; but the traditional proportions of the ancient basilicas are not observed, for the nave is three times as wide as the aisles. The church was not begun before the 13th century, and it is said to have been erected by the Crusaders, who left money for its endowment. Mr. Jackson gives a very careful description of the building, furnishing several views and details. The apse has a magnificent Cipollino marble baldacchino over the high altar, loftier than the famous one at St. Mark's, very chaste in style, though dating only from the 14th century. The choir stalls are specially good examples of woodwork, resembing the well-known stalls of the Frari at Venice. The façade of this church is the finest in Dalmatia, and the exterior generally is grander than the interior. The sacristy is an apsidal building, and formerly a church of greater antiquity than the present Duomo. The passage at L on plan was evidently an early chapel. The baptistery is clearly shown by the plan. The most perfect souvenir of Archbishop Maffeo Valaresso, who commenced the unfinished campanile in the Corso a few yards from the east end of the cathedral, is the very beautiful and quaint pastoral staff which he gave to the church in 1460. It is of silver parcel gilt, very richly ornamented. We hope to illustrate Mr. Jackson's drawing of it at an early date, when a detailed account of the piece will follow. Passing St. Maria, with its Italian-like tower, we reach the Franciscan convent and church of St. Francesco, founded by St. Francis himself when he visited Zara in 1212. The church was dedicated in 1282, but has been modernised. The woodwork of the stalls forms the only attraction to the architect, and these are of uncommonly good design, as will be seen by our illustration printed beneath. They are among the finest to be found in Dalmatia, besides being earlier in date and in a purer Gothic style than any others. They were made in 1394 by Giovanni de Borgo San Sepolcro, a Tuscan settled at Venice, and cost 456 golden ducats. St. George on horseback, St. Francis receiving the stigmata, and St. Benedict, with other saints of the Franciscan order, are represented. The chalices of St. Francesco and the ark of St. Simeone, dated 1380, are among the other art treasures of the city. Novigrad, San Michele d'Ugliano, with its castle; Nona, in Illyric Nin, the Aenona Civitas of Pliny, visited for its small domed and cruciform church of St. Nicholas, and the tiny Byzantine cathedral church, now half ruined, of St. Croce, with a nave 8ft. 7in. wide, are illustrated; and Vrana, leading on to Sebenico with its crowded quays, picturesque piazzas, and steep, winding alleys, a Venetian citadel on the coast, is fully described. The cathedral church at Sebenico is entirely constructed of masonry. Indeed, not only Italy, but Europe, may be challenged to show another chuch of this size in which neither timber nor brick is employed, everything being constructed of good, squared stone, marble, and metal. In England, a few rude churches in Pembrokeshire, the chapel at Abbotsbury, the treasury at Merton College, Adel Church, near Leeds, and St. Cormac, at Cashel, in Ireland, are similarly constructed; but these and others which could be mentioned are of a diminutive scale. At Sebenico, the

whole of the great cruciform church is covered by a waggon roof of stone, the underside of which forms the ceiling, the effect being very simple and imposing. The details of the church, the pointed arches to the arcade, the pulpit, the plan of the cathedral, and its general external outline all serve to furnish subjects for several admirable sketches in line and watercolours. Most of the work thus shown is very late in date, and there are no traces of any other public buildings of greater antiquity than the 16th or 17th century. One building, or, rather, doorway—for nothing but the doorway remains—must be visited. It is a house in the contrada of St. Gregoria, and here, carved by Giorgio Orsini himself, is the great architect and sculptor's doorway, enriched by the bear that symbolised his ancestral house of the Orsini, while on each jamb, amid pendent swags and bouquets of flowers, hang the mallet and chisels of his sculptor's art. We illustrate the doorway herewith.

Spalato deservedly occupies considerable space in the second volume of Mr. Jackson's book, with illustrations of the Duomo, the Campanile Baptistery, once the Temple of Æsculapius, and the six-apsed circular church of S. Trinità, never illustrated before. The domestic architecture seen in the narrow streets of Spalato abounds in charming fragments of Venetian detail, and some of the old palaces of the ancient nobility have really fine windows, and many a graceful staircase or arcade. The Roman capital of Dalmatia, Salona, or Salonæ, on the lower slopes of Cabani, has a Christian basilica of great interest and very curious plan, with a series of apses resembling nothing known elsewhere. The next chapter is occupied by Traü, which alone would claim an article to even briefly describe its buildings and unique cathedral. The glory of the church is its western portal, a work of great beauty and marvellous finish of execution, equal to any instance of Romanesque or Gothic art. The loggia at Traü is beautifully illustrated by Plate XXIV. Jak, with its church of almost French design, Poglizza, Almissa, Dernis, Knin, Lesina, bring the reader on to the Island of Curzola from the Duomo, of which place Mr. Jackson shows some especially refined detail, and also the Franciscan cloister of pointed work situated in a little bay close to the shore, "the loveliest cloister in Dalmatia," though Mr. Jackson's delightful drawing of the Dominican convent cloister at Ragusa leads one to fancy that it has not a few competitors for interest and picturesqueness at any rate. The Palace of Ragusa is certainly a noble architectural composition, and the sculpture of the capitals is beyond all praise, while the beautiful drawings of this work are eminently practical and artistic. The statuette of St. Biago over the high altar is another piece of work well worthy in its way of special attention, and it, too, is represented by a very fine drawing. There is a notable chalice and paten with an ostensorio, also of very peculiar design, in the church at Mezzo. At the Greek convent of Savina there are several similar art treasures and examples of church plate. Some crosses of enamel and filigree, carved wood set in silver, some Byzantine-like hanging lamps, and "countless other wonders that made us open our eyes," adds Mr. Jackson. The Petohljebnica, a five bread platter consisting of a tazza from which rises a cup with four branches supporting two little cruets and two little platters, with several other things of like kind, are illustrated. One of the lithographs herewith represents the magnificent ciborio or baldacchino over the high altar in the Duomo at Cattaro. The reredos is formed by a gleaming pala of silver gilt, which evidently is not in its original state. In the top panel is a figure of our Lord in the centre; in the middle panel below this is St. Trifone, with a model of Cattaro. On either side of these figures are three others of saints, with flowing drapery and well-modelled hands and faces. The ciborio is formed by four slender octagonal columns of red marble from Lustiza, supporting a canopy formed by a series of three stages, all octagonal on plan, with little columns carrying trefoiled arches, and each with a sloping roof. A gilt angel surmounts the whole. It is wonderful that so slender a piece of construction should have escaped the earthquake in 1667, which destroyed the towers and west front of this cathedral. Both pala and baldacchino seem to be of the same date, towards the latter part of the 14th century. Want of space obliges us to pass over Parenzo, where in the Duomo there are some wonderfully beautiful marble work and carvings to be seen, and we leave the Island of Arbe with a similar regret, which extends also to Aquileja and Trieste. From Grado Cathedral we are enabled to illustrate the particularly interesting pulpit, which consists of two parts, belonging to widely different periods. The pulpit itself, and the six columns which carry it, are of white marble and of Byzantine work. The pulpit is sexfoil on plan, and rises 7ft. above the pavement. Four of the sides are carved with the four beasts of the Apocalypse, and on the fifth side towards the east is a large cross. The Arab-looking tester or canopy gives a strange Oriental air to the interior view of the church. It consists of six marble colonnettes, supporting six ogee trefoiled arches, corresponding with the six sides of the pulpit below, on which rests a dome of brick, plastered and painted red and white in scrolls and chequers. It dates from the 15th century, and may have been imitated from the picturesque little pulpit which rises out of the northern ambo at St. Mark's, Venice. The mosaic pavement in this basilica is very remarkable, with Latin and Greek inscriptions side by side, and the patriarchal chair at the east end of the church, with its tester over it, is also most interesting. The duomo has not before been described by any English architect, and Mr. Street was only able to cast a longing look that way from the campanile of Aquileja, while his account is taken from Eitelberger's article. There are other churches in Grado also mentioned by Mr. Jackson, and with these his labour of love closes. His book is a scholarly treatise, rich in facts, eminently readable in style, and graphic in descriptive power. His technical experience has enabled him to avoid all that is unworthy of record, and a practically concise account of his travels is the result, and for this the best thanks of all architects are due. Mr. Henry Frowde, too, is to be congratulated on the admirable printing and general get up of these three useful volumes.

VIBRATION OF BRIDGES.

AN exhaustive and learned paper on this subject, by Mr. S. W. Robinson, member of the American Society of Civil Engineers, appears in the "Transactions" of that society. The author's object is to present facts and figures in connection with the application of a so-called bridge indicator to railway bridges. The indicator is an instrument which analyses the movements, reducing them into the vertical and horizontal components. It was applied to bridges on the New York, Pennsylvania, and Ohio Railroad and other lines, and resulted in 193 diagrams. Vibratory movements were discovered, due to a combination of circumstances, including speed of train, car length, panel length, time of vibration of loaded bridge, rigidity of bridge flooring, &c. Besides this cumulative vibration, there was one due to unbalanced locomotive drivers. Mr. Robinson gives a series of diagrams of an interesting character. Three distinct vibratory movements are recorded. One line traced by the indicator shows the vertical movements, a line full of vertical ridges or jerks; a second line represents the lateral movements of the bridge, and another horizontal line is the line of reference. The indicator was placed at the panel point nearest mid span. These records of vertical and lateral movements were carefully devised; thus, deflection of the bridge, as where a train moves upon the bridge, is noted by a sudden rise in the pencil above the straight line. The statical deflection of bridge at a corresponding time is noted also by the movement of the paper strip as it travels along. The indicator used by Mr. Robinson may be briefly described as a clock movement for uniformly moving a strip of paper before two pencils, one recording the vertical and the other the horizontal movements upon it. The speed of the paper was about 15in. per minute. The table giving the results from all the diagrams is of value; the cumulative effects are also given in other tables. It may be mentioned that the Bollman truss gave few indicator records, while the Pratt truss is particularly susceptible of elastic vibration, as the upper and lower chords are connected firmly by bars into a whole, so that if one point is depressed by weight the whole truss is affected thereby. In cumulative vibration the impulses succeed each other at intervals, which are in keeping with the vibration period, or "in time." The author enters mathematically into the subject, and into the causes of those non-systematic lateral movements due to the wandering of trucks from side to side on the clearance between gauge of rails and wheels, and to crooks and joints in the rails. The most potent cause of bridge vibration is repetition of impulses, and is found to arise from the non-balance of the drivers, there being an impulse downwards when the excess of balance is downward, and *vice-versa*. The vibration occurs when the times of revolution of the drivers coincide with the periods of double vibration; the effect is then cumulative, and intense vibration is the result. A bridge is free from vibration when the revolution and vibration periods are not in harmony; hence when a body of soldiers crosses a bridge they break step for the purpose of avoiding cumulative vibration. The conditions favourable to vibration of this sort is thus stated:—*Primary:* Under suitable train-speed—(1), Non-balance of driving wheels; (2), yielding stringers in bridge floors, with equality of panel and half-car length. *Secondary:* (*a*), Vertical vibration of car on its springs; (*b*), equality of driving-wheel circumference and panel length; (*c*), excess of non-balance of drivers down at mid-panel; (*d*), free pedestal blocks, as on expansion rollers; (*e*), fish-shaped trusses, &c. The author observes that cumulative dynamic effect can be reduced mainly by counterbalancing the machinery so as to occasion no vertical components of non-balance: by giving rigidity to bridge stringers or making them very deep, not less than the depth of floor beams, and by making panel length so that no multiple of it will equal length of any car; by substituting sliding for expansion rollers. Generally, all trusses, like the Pratt, with upper and lower chords vibrate; but the Bollman, Fink, &c., will not. We recommend all railway engineers to study Mr. Robinson's useful paper.

THE SHORTCOMINGS OF SOME MODERN SANITARY METHODS.

AT the anniversary meeting of the Sanitary Institute of Great Britain, held at the Parkes Museum, Margaret-street, W., on the 14th inst., Sir Douglas Galton presiding, medals and certificates awarded to exhibitors at the Exhibition at York, in 1886, having been presented by the chairman, Dr. G. V. Poore delivered an address on "The Shortcomings of Some Modern Methods of Sanitation." The lecturer made a vigorous attack on the practice of mixing putrescible matter with water—*i.e.*, on the method of dealing with excrement by means of water carriage. He pointed out that recent investigations have shown that the decomposition of organic matter depends upon the growth of microbes. When organic matter is buried not too deeply in the soil the microbes are of a kind which cause oxidation and nitrification, and prepare the organic matters for absorption by the roots of plants. When mixed with water the microbes produced are different, and those offensive changes are caused which are known as putrefactive, and ammonia and carburetted hydrogen are formed, and oxidation is prevented. The mixing with water prevents and delays the only natural use of organic refuse—viz., that of forming food for plants. This practice, therefore, may be regarded as one which is antagonistic to natural law, and it is evident that such an antagonism is worse than hopeless. The mixing of organic refuse with water in cesspools and sewers causes putrefaction of it, and these putrefactive changes are not only most repellent to our senses, but are a great and universally acknowledged cause of diseases of various kinds. Further, many diseases of the zymotic class have of late years been shown to depend upon living organic particles, which possibly multiply in putrefying liquids, and are disseminated in the most perfect manner possible when organic matter containing them is mixed with water and allowed to flow to rivers or wells. No method of "sewage treatment" can be considered as reliable for the removing or rendering innocuous of zymotic organisms. This practice

of mixing with water involves a neglect of the great principle of "resisting the beginnings." The "Water System" inevitably produces a fouling of our rivers. Of this fact the Thames is a glaring example. With increase of water-carried sewage, pure water is getting daily more difficult to obtain. The financial and economical results of the water-carriage system have been disastrous. The lecturer contended that we have no right to borrow money for sewers, because they must be a source of expense and never a source of profit to those who come after us. The results of co-operation were most disastrous when persons co-operated to commit a blunder, and each generation ought to be at the sole charge of its own sanitary experiments. It was pointed out that water carriage, by enabling houses to be built without any curtilage whatsoever, was a great cause of overcrowding, the greatest of all sanitary evils, and this system of "water carriage" was not limited to towns, but was common in country districts where there was no possible excuse for it. The lecturer said he was a strong advocate for the dessemination of sanitary knowledge; but he was no advocate for legislation, by means of which blunders were often stereotyped. He advocated the encouragement of independence by householders, and he contended that those who did not use the sewers should not be compelled to pay for them. Our present method of levying rates was a distinct premium on jerry-building and overcrowding. If an equitable adjustment of sanitary rates were instituted, and the Pollution of Rivers Act were enforced against individuals, and if water were supplied by meter, sewage schemes in such places as the Thames Valley would very quickly become unnecessary, and people would subject organic refuse to immediate burial. The outcry for allotments was good, and if the allotments were near the houses, so much the better. Sewage farmers advocated an acre to every 100 persons; but it was clearly better to let the 100 persons live on the acre of ground, and thus save the expense of sewers, and reap the benefit of the produce. If every cottage (for the average five persons) had one-twentieth of an acre of ground, the sewage difficulty would disappear, and there would be an increase of health and contentment. A "Workman's City" built on this plan would accommodate 64,000 persons to the square mile, or, making allowance for roads, 50,000 to the square mile.

Sir D. Galton, in thanking the lecturer for his address, alluded to a proposal lately made for buiding a "sanitary house" in London, and stated that the scheme fell through because it was impossible to build a sanitary house on the area allotted to it, and at the same time pay the rent and interest. Until people insisted upon getting sufficient area on which to build, they would not get healthy houses.

THE SCIENCE AND ART DEPARTMENT.

THE report for 1886 of the Department of Science and Art was published on Tuesday, and states that the statistics of science schools for the last ten years show that the slow but steady rate of increase which obtained in previous years was somewhat accelerated last year. The number of schools examined increased by 140, the number of classes by 213, and the number of students under instruction by 6,028.

Of the 1,682 schools examined in May, 1886, 1,259 were in England and Wales, 226 in Scotland, and 197 in Ireland. The number of students who came up for examination from them was 54,462, or an increase of 5,965 on the previous year. In addition to these, 4,014 self-taught students and pupils from classes not entitled to claim payments on results presented themselves for examination. Many students came up in more than one subject, the number of papers worked at the examination by the 58,476 students who sat being 114,432, or an average of nearly two papers per student. This average is generally increasing; 44,997 candidates were successful in passing in one or more subject, and of these, 23,230 were successful for the first time. In the previous year 37,133 were successful and 19,058 for the first time.

In 525 art classes 31,491 students were taught, 15,855 students sent 256,422 works to the annual examination, to which 164 prizes were given; 14,269 were personally examined in the second grade, of whom 5,606 were successful and 1,336 gained prizes. In 1885 the corresponding numbers were 488 classes, 23,410 students, of whom 14,332 sent up 207,046 works; 12,257 were examined, 4,639 passed, and 1,257 won prizes.

During the year seven new schools of art and three additional branch schools have been opened, raising the total number of schools of art from 198, with 18 branches, to 205, with 21 branches. In these schools 40,134 students have been taught, of whom 27,600 submitted to examination 332,040 drawings, paintings, and models, while in the previous year of 39,660 students, 25,275 sent 284,490 works.

The number of objects acquired for the art division of the South Kensington Museum in 1886 was greater than for the year 1885, and the Museum gained, both by gift and by purchase, several examples of art of great importance. Mr. George Wallis, the keeper of the art collections, reports that the number of objects acquired by purchase, gift, or bequest in 1886 was 1,835, as compared with 509 in 1885—viz., general art collection, 1,295; Indian section, 156; school examples, 384.

The expenditure of the department during the financial year 1886-7 amounted to £410,337, which was apportioned as follows:—Expenses of administration, including central staff office expenses, £27,571; direct payments, prizes, &c., to encourage instruction in science, £88,674; direct payments, prizes, &c., to encourage instruction in art, £89,835; services common to both science and art instruction, £56,257; institutions supported or aided by the State through the Department, £56,051; and South Kensington and Bethnal-green Museums, including expenses of circulation of science and art objects to country institutions, £91,949.

THE CONVENT, OLDHAM.

EXTENSIVE alterations and additions have been made to the Convent, Oldham, and the work, which has extended over a period of twelve months, has been brought to a termination, the new portion being opened on Saturday last. Upon the ground floor a large refectory has been built, with passages adjoining, while the existing rooms have been considerably enlarged. The first floor of the extension consists of dormitories, corridors, and bath-room, while the chapel, which is of lofty proportions, is on the second floor, being entered from the portion previously erected. It has an elaborate open-timbered, hammer-beam roof of 16th-century design, enriched with delicate tracery. The chapel walls, to a height lineable with the window bottoms, are covered with oak panelling, the head of each panel being filled in with intricate tracery, transitional in character, and the panels alternating in design. On each side of the chapel are ten stalls, the arms of each stall being filled in with quatrefoils, cinquefoils, and other enrichments, the seats being made to lift up; the miserere carvings, which are under the seats, being of exquisite workmanship, the whole varying in design and detail. At the extreme end of the chapel, adjoining the entrance, is an elegant, though boldly designed, screen, consisting of eight compartments or bays, the upper portion of each being filled in with delicate enriched tracery, the whole being crowned by a bold Perpendicular cornice.

At the other end of the chapel is the altar, a splendid piece of workmanship of Decorated Gothic design, consisting of an elaborate crocketed centre pinnacle and side pinnacles, between which are ornamental gablets filled in with rich tracery, crowned with angels, and supported by boldly-designed arches resting upon clustered columns, with moulded bases and foliated capitals. The centre pinnacle, which is of richer design, and rises to a greater height than the others, overhangs a Decorated niche with groined roof, in which is the Crucifix, whilst the tabernacle, which has a brass door of rich design, stands well in front upon the altar table. The side niches are filled in with statues. The altar table, which is executed in stone, stands upon black marble columns, with enriched foliated caps and Decorated bases, the black columns producing a pleasing contrast to the principal portion, executed in oak.

The whole of the chapel floor, and the principal portion of the fittings, are of light-coloured oak, whilst the stone tracery windows are filled in with stained glass, two of the windows containing representations of Our Lady, St. Joseph, St. Angela, and St. Stanislas, the whole being of exquisite beauty, rich in colour, and harmonising in design. The brickwork has been executed by Mr. Haines; the masonry by Mr. Staley; the joiner's work and slating by Messrs. S. Ashton and Sons; plumbing, glazing, and painting by Mr. Hearne, all of Oldham. The plans of the building, and details of the altar, screen, and other fittings have been prepared by Mr. A. Banks, architect, Oldham, who has superintended the erection of the work.

THE PLUMBING TRADE IN AMERICA.

THE Convention of the National Association of Master Plumbers, at New York, has adopted thirteen sections as a substitute for the previous apprenticeship law of the association. From these resolutions, we find that the term of apprenticeship to the trade shall be five years, and no boy to be taken until he is 16 years old. Each employer is to make a return to the apprenticeship committee of the list of apprentices in his employ, with their ages, addresses, &c. A record of apprentices and their addresses will be kept, and for each apprentice so recorded the secretary shall issue an apprentice certificate, to be retained by him so long as the apprentice is in his employ. When the boy takes another place, the certificate is given to the new employer, to be filled in with date of beginning of service, and so on, until the certificate shows the proper time has been served. Any boy wishing to learn the trade sends his name and address to the secretary, who will notify to him when to appear for examination. A beginner in the trade will be required to work six months on probation, at the end of which period he is to appear before the committee for re-examination, and if found worthy his certificate of apprenticeship shall be issued, the time already spent in the trade being allowed on it. When the five years shall have been served, the apprentice is to receive a diploma, giving the date of service, signed by the president of the Association. Boys having a diploma from any trade school shall be allowed a deduction of the last year from the term of apprenticeship. These are the main points of the resolutions. Under the recommendations, every apprentice is protected by his certificate, which becomes at once his passport and a record of his service. As an encouragement to the apprentice to make the best of his time, no better rule could have been devised. The last resolution is to the effect that no master plumber can discharge an apprentice owing to want of work without providing employment with another who has work and can teach him.

THE PROFESSION OF A CLERK OF WORKS.*

By THOMAS POTTER,

Author of "Concrete: its Use in Building," "The Construction of Silos," &c.

(*Continued from p.* 80.)

TO be a good correspondent is an undoubted advantage to a clerk of works; the happy knack of being able to express a good deal in a few words and to explain matters intelligibly and to write plainly, are items which should not be lost sight of, and which a good many, in other respects excellent men, are deficient in; and I submit that a good plan to obtain proficiency in condensation is to—if time permits—strike out every unnecessary word in the first draft of letters, and then rewrite them, repeating the operation if time permits, "boiling down" till in the fair copy there is not a word more than is wanted, and no repetitions. It will be said that in many cases there is insufficient time to take all this trouble; but it should be looked upon as an absolute necessity, and, moreover, each occasion this course is pursued the less need there will be for "boiling down," till eventually there is none. Many persons of business, with but little time to spend uselessly,

* All rights reserved.

and who know the handwriting of certain correspondents addicted to verbosity, will pass their letters on one side, to be read last or at leisure, and feel it anything but a pleasure to wade through a lot of irrelevant matter and numerous repetitions. The unfortunate example set by many persons—some architects included, who can do otherwise if they like—of writing so unintelligibly that errors are often occasioned thereby, should not be copied; there is no reason whatever why the clerk of works must go and do likewise, but there are many reasons why he should not. In inclosing sketches for any needed alteration or explanation, it is always advisable to make them plain, and, if possible, to scale; moreover, to send tracings, keeping the originals in case the architect may make any remarks in connection therewith, which would need a reference to the sketch; but which he had omitted to return or desired to retain. There is no need to expiate on the necessity of as good a knowledge of drawing as the clerk of works can by instruction and practice obtain. With many persons, this knowledge is undoubtedly a gift, aided, however, by perseverance; whereas, on the other hand, aspirants to the position of clerk of works should remember that the man who never attempts to make a sketch or a working drawing other than as a matter of necessity is never in a fair way of becoming an expert draughtsman. The acquired knowledge of construction which a clerk of works possesses, or should obtain, before he fills that position is a great aid to elementary and detail drawing; he probably knows how to make, or has himself in some previous capacity delineated on chalked boards or lining paper, full-size working drawings of masons', joiners', or carpenters' work, and no better initiatory practice could be desired; thence to making ordinary details to scale is a comparatively easy step, and so by degrees the amount of proficiency obtained as a draughtsman gradually increases *pro ratâ* to the capacity and energy of the individual. Many thoroughly good men fail, however, to become experts in this direction, while others appear to have a talent for drawing, sometimes at the cost of decided inferiority in other respects. It by no means follows that because a clerk of the works is an inferior draughtsman, his knowledge of plans and of the correctness of details is likewise faulty; indeed, it may happen to be just the reverse, in a similar but opposite way, that an architectural draughtsman may be clever and correct in making drawings, and yet be unable to say why he follows out certain well-known principles of construction. A recommendation which may be of use to those who are about to become clerks of works, but obviously unnecessary to those who have been in that position long enough to find it out for themselves, is not to buy or use inferior instruments because of their inexperience in draughtsmanship, any more than a person learning to write should practice with bad pens. Nor is it prudent to purchase second-hand instruments or unredeemed pledges, unless one is an excellent judge of such things; for, like watches, many are made to sell, not to use, and are treated in a similar way—viz., fraudulently stamping thereon some well-known maker's name, such as Stanley, or Elliot, to influence purchasers. Buy instruments of manufacturers whose names are upon them, and whose reputation won't admit of their being placed upon trashy articles. For a guide to the use, cost, and purposes of drawing-instruments and their accessories, drawing-paper, drawing-boards, &c., there can be no better guide than "Stanley's Drawing Instruments," price 5s., published by Stanley, Great Turnstile, Holborn; Heather's "Drawing and Measuring Instruments," a cheaper work, costing Is. 6d., one of Weale's Rudimentary Series, also contains a good deal of practical information on mathematical instruments and how to use them. As it is not the clerk of works' place to set out buildings and builders' work generally, neither is it, as before stated, to give levels for floors, doorways, window-sills, and the like; but the circumstances are somewhat different, and in this way: instead of using a long parallel board or straight-edge with a spirit-level let into the edge thereof, or a similar board and a mechanic's spirit level, it would be exceedingly beneficial if it were more the practice to employ a surveying level on tripod stand. He could fix the correct position of window-sills, door-sills, string-courses, &c., at as many points as were necessary with the utmost precision, and in a fourth of the time required for ascertaining the same by the ordinary arrangement. For buildings of small area, in streets and confined spaces, it is not always practicable to do this; but where plenty of space exists it is often possible to determine the exact position of a large number of objects, say, for instance, window-sills on a similar level, with one adjustment. Even the wall-plates of the roof can in this way be bedded with the greatest nicety. The simplest method is to set the level, accurately adjusted, at the most advantageous point, to command a view of the largest number of places where similar levels are required; then stand up a wooden rod, the bottom of which rests against or on the brick joint, door-sill, or other bench mark that is the datum point or level from which all heights are taken, and is, of course, within the line of view of the spirit level. The rod has previously been cut off to the length that the datum point is below the bed of window-sills, or whatever series of levels are required to be given. A pencil mark made on the rod at the exact point where the hair-line crossing the object-glass of the level cuts it is all that is required, for the rod can then be moved to any place where levels are needed, and whenever the pencil mark coincides with the hair-line on the glass, the top of the rod is the exact point required. The operation is so simple that to go wrong is all but impossible, if the operator only sets his level correctly, and is sure that the pencil mark and hair-line come together. What is known as a drainage level or builders' level answers fairly well for the purpose, and is made by most of the mathematical instrument makers, costing from £4 to £5, including a tripod stand. The object-glass is, however, small, and the field or range of vision therefore very limited; but a much superior instrument for the purpose, if the clerk of works can afford to purchase one, is a 12in. dumpy level—the one known as Gravatt's, which costs from £9 to £12, but may be procured occasionally second-hand at about half the original cost. The compass attached thereto is of but little use to a clerk of works, and only adds to the price. An instrument of this kind is useful, too, for giving the level of foundation trenches, the concrete formation for receiving the first course of footings, inclinations for slopes, levels for roads and terraces, and the fall for drains. If the level is a good one, and the clerk of works is located in a country district, he may for practice employ any spare time he may have during the long days of summer in taking ground levels in the neighbourhood, and thereby obtain sufficient practice to enable him to use the instrument when employing it at and about building operations. For primary and simple instructions as to the use of the level and levelling staff, "Heather's Treatise on Surveying Instruments," price 1s. 6d., one of Weale's, is a useful work; so are "Levelling," by Scott M'Donal, published by Batsford, 52, High Holborn, and "Popular Instructions in the Art of Levelling," published by Simpkin, Marshall, and Co., the former costing 6d. and the latter 1s. In taking for practice a long-distance level, where the instrument has to be shifted from time to time, it is very necessary to go back over the same ground, commencing at the point where on the first occasion the operator finished, and if the difference of level between the two extreme points is found to be alike in both cases, it is complete evidence of a correct "taking"; if otherwise, just as clear evidence of errors somewhere in the calculation, and the ground must be gone over again and again, and until the difference of levels, whichever way they are taken, come alike. For squaring foundations and setting out walls, there are several kinds of instruments. The cross-staff head is a circular or octagonal brass tube 4in. or 5in. in length, and 2in. or 3in. in diameter, and with several very fine slits or hair-lines which are cut or fixed at mathematically correct angles to each other. The cross-staff head has a movable socket which is fixed on a rod or staff driven into the ground, and another rod or staff is fixed at any distance within sight. The imaginary line between the two rods forms the base line; for instance, the front wall line of a long range of buildings; a rod being placed at each corner or angle, wherever by looking through the slits at right angles to the base line another rod can be seen (which must be moved about till it is visible through the sights), the third rod is then at right angles to the base line, as from the centre of the optical square. The head is moved with ease to bring it to its correct position. Obviously this instrument does not give a square line with sufficient nicety, on account of the nearness of the sights to each other, for buildings of any pretensions, although it may often do for setting out ground work. The price of plain cross-staff heads varies, according to size, from 5s. to 12s., and an iron-shod staff is 2s. 6d. extra, or tripod stand 7s. 6d. A much handier instrument for a clerk of works to use for squaring is a semi-circumferentor, which, as its name implies, is a half ring of brass, 5in. or 6in. in diameter, with movable sights at each end of its diameter, and therefore 5in. or 6in. apart; two other sights are fixed to a brass bar which revolves on a pivot, and this brass bar is brought into position whereby the movable sights are set square, or at any desired angle with the fixed ones, by means of graduated marks on the brass rim of the circumferentor. A tripod stand is necessary for accurate work, and which should have a hook on the under part of the head upon which a steel point plumb-bob can be suspended, to ascertain the exact points or position of the base line. A line held in the hand with another steel point bob attached to it, and moved about till it comes within sight of the operator, who is looking through the "sights" of the semicircumferentor in the same way as with the optical square, gives the position required. A good instrument will define a square line, if accurately taken, within an inch in 60ft. to 70ft.—quite near enough usually for any building. An instrument for levelling, and another for setting out square lines and angles, comprise practically all the outdoor mathematical instruments a clerk of works requires, or can be expected on the largest works to possess; but it may not be out of place to call attention to smaller matters which are often considered too trivial to demand consideration. The safest form of lineal measurement for building details is undoubtedly a wooden rod; a tape is not reliable where great accuracy is required, and needs two persons to take dimensions over six feet, whereas a rod is usable single-handed. When the building is of some importance, it is advisable to have sufficient rods and of different lengths, and it is better to have them by successive five-feets—5, 10, 15, and 20, for example; if the rods are painted black and the figures white, they will keep cleaner than if not painted at all, and the latter are more readily distinguishable than common pencil figures. Where they are likely to have constant use and for some considerable period, it is advisable to have them iron shod to save the ends wearing away. The figures should be plainly painted, and of the Arabic character, not the Roman, which may possibly cause errors, such, for instance, as IX. being taken for XI., and similar blunders quite possible when dimensions are hurriedly taken, and perhaps in semi-daylight. The ground square is best made of dry deal, and painted to prevent moisture causing it to expand so readily as an unpainted one, whereby it would be rendered uncorrect. Nor should it be made with the sides taper, a usual thing to do for convenience and lightness in handling, because if contraction or expansion takes place it is not then uniform. A ground square and measuring rods do not necessarily form a portion of the clerk of works' possessions, but they are usually available for his use when required. Although the builder is not bound to provide any particular form of measuring rods or ground squares, any more than he is to supply special descriptions of other tools or appliances for carrying out the work, yet small favours of this kind are more readily granted at the commencement of a building than is sometimes the case when the contract is more advanced or nearer completion. What are the complete duties of a clerk of works is a question which can only be answered in a general way, for, after all is said and done, it must simply be a matter of arrangement dependent on the three things: 1st, what the nature of the work requires; 2nd, what the architect requires doing; and, 3rd, what the

clerk of works is capable of performing. There is no trade unionism among clerks of works, no hard and fast line as to what they ought to do or ought not to do. Occasionally something of the kind crops up with too sensitive members of the calling; but it may be safely assumed that anything in connection with the works which an architect would not consider *infra dig.* to perform himself, cannot be objected to by a clerk of works, unless it be derogatory to his position, or is of a nature to interfere with his prime duties of keeping watch and guard over the work generally, or cannot be performed in addition to his ordinary work within the time during which he is supposed to be attending to his employers' interests. If the building is a small one, requiring no special knowledge and but a moderate amount of general supervision, it is not likely that a man of superior qualifications would be appointed or accept the appointment; on the other hand, if the proposed works are of an extensive character, requiring considerable skill and other attainments, the duties would go with the qualifications, and the *quid pro quo* would probably be to a certain extent commensurate therewith. But whatever may be the sum total of his attainments, the clerk of works should remember his is a position of great trust and responsibility, and no amount of good nature or sympathetic fellow feeling should be allowed to interfere with the just performance of his duties. If, at the commencement of the works, he is found to be of a yielding disposition, or easily persuaded to permit the use of indifferent materials or workmanship, he will never afterwards regain proper authority; on the other hand, a firm and decisive course of action, practised in a quiet and courteous manner, will insure him respect and attention to his instructions, and the confidence of his employers.

(*To be continued.*)

CHIPS.

Count Gleichen's full-sized bust of the Earl of Beaconsfield was sold at the sale of the effects of the defunct Beaconsfield Club for £42 to an hotel-keeper at Bournemouth. It cost the club £350.

Mr. Harry Hems, of Exeter, has just been commissioned to execute a life-sized medallion of the Queen in oak for the Working Men's Conservative Club at Newbury, from a desigh by Mr. J. H. Money, architect, of Newbury. Her Majesty is represented wearing the State veil and Imperial crown.

The new reredos at St. Nicholas's Cathedral, Newcastle-on-Tyne, was dedicated on Friday. It has been erected from designs by Mr. Johnstone, of that city.

Messrs. H. and R. Miller, of Castle Bank Works, Edinburgh, have completed the erection of a clock and bell in the tower in the Pitlochry new church to the memory of the late Mr. Archibald Butter, of Faskally. The clock has three illuminated dials, 4ft. 6in. in diameter. The bell is 15cwt.

On Thursday, the 14th inst., a meeting of the Yorkshire Association of Medical Officers of Health was held at Hull. In the morning, Dr. J. W. Mason, the medical officer of health for that borough, received a number of the members at his office at the town hall, and subsequently conducted the party to the new Sanatorium on the Hedon-road and other places of interest in Hull. In the afternoon the visitors met at the town hall, Dr. Hime, of Bradford, the president, being in the chair, when some business was transacted, including the formation of a new class of "associates," and papers were read and discussed.

The Sunderland Corporation have purchased Mr. John Blair's picture of the Tweed at Norham, which was exhibited in the last spring exhibition of the Royal Scottish Academy. The picture has been hung in the Corporation Galleries.

Particulars have just been published of the great bell for the Cathedral of Cologne, recently solemnly inaugurated. The bell weighs 27,000kilos., or about 26 tons 13cwt. The clapper alone weighs 800kilos., or nearly 15¾cwt. Its perpendicular height is almost 14½ft.; its diameter at the mouth nearly 11½ft. Twenty-two cannons taken from the French were assigned by the Emperor William for its manufacture; 5,000kilos. of tin were added. It was cast by Andreas Hamm, of Frankenthal, and £1,050 were paid for the casting. It will be known as the Kaiserglocke, or Emperor's bell; and as the two other large bells in the cathedral bear the epithets respectively of Pretiosa and Speciosa, this one is styled Gloriosa.

OUR COMPETITORS' COLUMN.

MANY of the writers in this, our eighth competition, have gone considerably beyond our invitation, and dealt at length with the merits and demerits of existing societies, and offering suggestions for their improvement and organisation. We simply asked for suggestions as to sessional papers, and we award the prize to Mr. Charles T. Taylor, of 18, Clegg-street, Oldham, whom we placed second in last week's competion.

We now offer another prize of One Guinea for the best short essay, naming the architect who, during the past thirty years, has

MOST DECIDEDLY INFLUENCED ECCLESIASTICAL ARCHITECTURE IN ENGLAND.

To be sent in by July 22.

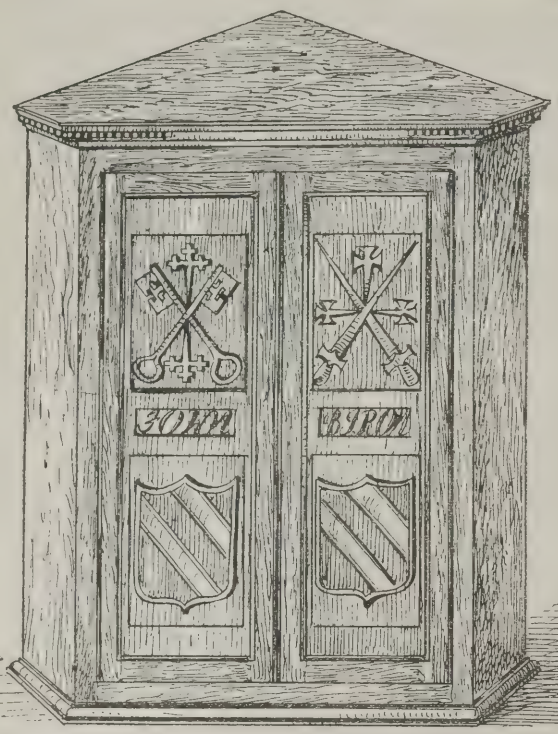
And another prize of One Guinea for the best paper giving

THE EXPERIENCES OF AN ARTICLED PUPIL,

comprising such hints for self-improvement and the best utilisation of time and resources as may benefit others. Papers giving actual personal experience will be preferred. To be sent in by July 29. This will conclude the series for a few weeks, when the column will be revived, together with a new series of the Designing Club.

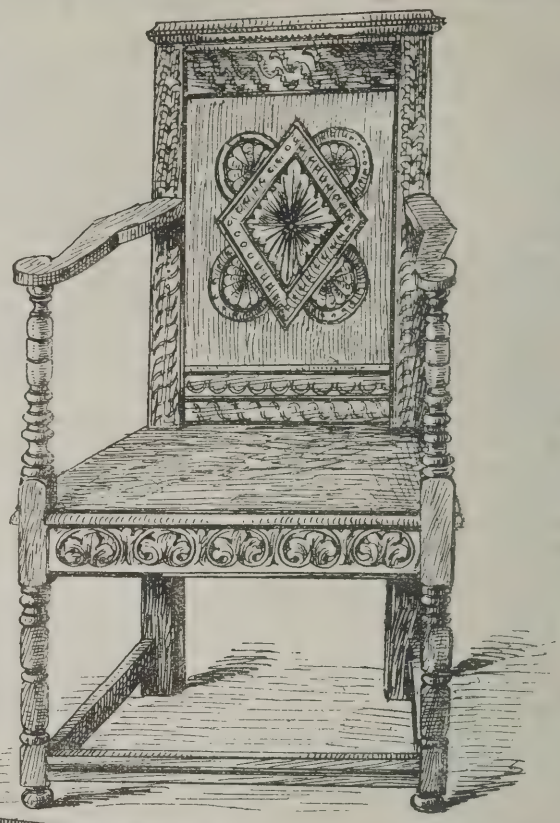
SUGGESTIONS TO ARCHITECTURAL SOCIETIES.

I think this subject, coming, at it does, at the present time, is a very opportune one, inasmuch as just now we might say that the architectural profession is in a state of spirited agitation, principally owing to the prominent position the important subjects of Federation and Registration hold in the minds of the majority of the profession. For a period now of between two and three years, the discussion both at society meetings and through the press has been carried on, and during that time we have found that the support accorded to the same has greatly increased, thus proving that the more the subject is brought before the attention of architects the more support it will receive. Now, the question is, Ought this scheme to be successful? Is it worthy of the support of architects? For my own part, I most decidedly think it would be beneficial both to architects and the public generally; consequently, it deserves the undivided support of each and every one of us. Granting that the scheme is entitled to our support, I think it is the one subject which ought to be dwelt upon and discussed more than any other at meetings of architectural societies next session. The subject generally proves to be a very interesting one, and affords ample of opportunities for discussion, as we are able to prove after having read papers on the same delivered before societies. Essays and papers recommending a course of studies for students preparing for the Institute examination would be very useful, as it is advisable to popularise these examinations as much as possible, more especially amongst the younger members of the profession; but at present it is no small matter to make up one's mind where to commence, as the list of subjects and the books recommended by the authorities is so extensive and varied. I think, therefore, the more information we get on the same, with approved courses of study laid out, the better it will be, as students will begin to feel more interested, consequently more will offer themselves to undergo the test. The subject of architectural competitions is also one that might be dealt with at great length and with great advantage to the profession, as there appears to be not the slightest appearance of anything like a unanimous opinion on the matter. True that a great number signed a memorial undertaking to refrain from competing in an open architectural competition without the drawings were to be adjudicated upon by a professional man; but even this appears to have accomplished very little, as we hear day by day of unsatisfactory and unfair awards being given. Some more comprehensive measure than the memorial is required; but the difficulty is to suggest a better. I, therefore, recommend such subjects (as, say, suggestions for the conduct of architectural competitions) as being fitting ones for papers and discussion, as then opinions and ideas might be interchanged and some benefits derived. Notes on professional practice recommends itself as a suitable subject to deal with, including such questions as the giving of certificates, professional charges, and claims, responsibilities, supervision, travelling charges, quantities, specification, and the duties of clerks of works. I think the whole of the foregoing subjects offer themselves as suitable ones for papers, &c. I have no doubt they would be appreciated by members more than any other, as the whole of them bear directly on an architect's practice, therefore, of course, being of great interest to us all. Architects, as a rule, are deficient in the knowledge of law as relating to the profession; such questions as easements, prescriptive rights, light and air cases would perhaps not involve such exorbitant costs to the client if sound advice could be given by the architect in the first instance. This subject might be treated in such a manner as to be very instructive to members of architectural societies. As there are comparatively very few lectures given under this title, dilapidations and valuations might be classed under this head.



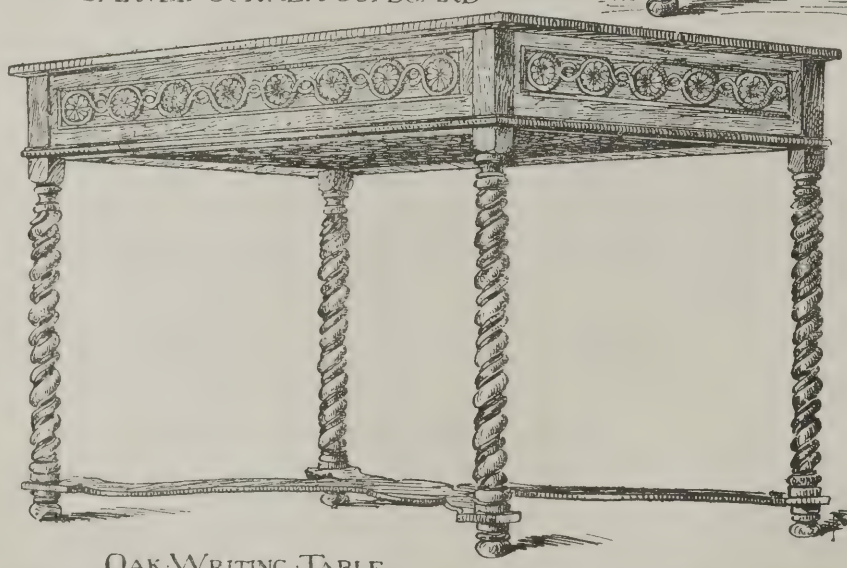
Lectures on special buildings would come useful to architects generally, because, as a rule, an architect is called upon to design almost all classes of buildings without having the opportunity of making any one class a speciality: therefore, if he could have the benefit occasionally of a good paper, well illustrated, on these special buildings, such as technical schools, breweries, dairy farms, theatres, fire-engine stations, &c., it would be greatly to his benefit. Perhaps an occasional lecture on perspective and draughtsmanship would come in useful, the former, of course, just dealing with the rudiments and general rules, as unfortunately the books treating of the subject are compiled in such a manner as to be of very little service to a student. Of course, such subjects as sanitary science, including drainage, plumbing, ventilating, and warming would require attention, else we should find ourselves falling behind on account of the rapid rate at which the different branches of this science have progressed during the recent years. Lectures on construction, &c., and on the different materials required in the erection of buildings are always instructive, and are generally listened to with interest. We must not neglect the art branch of our profession, therefore, it would be advisable to reserve a few evenings for the benefit of same. It would be a good idea in an architectural society to have short readings on those evenings devoted to art, from such works as Ruskin, Fergusson, &c., each member to take his turn at reading. This, I think, would be very instructive, to be concluded by discussion on matter read. A lecture showing the advance of building operations, also one showing the advance of art during our Majesty's reign, comparing the buildings of to-day with those erected 50 years ago and subsequently, would be interesting. A lecture on recent large competitions, comparing competitors' instructions, giving details of each, showing which might be considered to be successful and which failures. I might instance Admiralty and War Offices, Edinburgh Municipal Buildings, Edinburgh Free Library, Birmingham Assize Courts, Imperial Institute, and Liverpool Cathedral. Criticism on above designs would be very interesting, as they are the latest examples of English architecture.

CHARLES T. TAYLOR.



18, Clegg-street, Oldham.

Some friends of the veteran engineer, Mr. Thomas Hawksley, waited upon him on Tuesday week to congratulate him on his 80th birthday. The Attorney-General, who was at the head of the party, gave a brief address, complimenting Mr. Hawksley on his long and useful labours, and on his continued health and energy. In acknowledging the address, Mr. Hawksley said he claimed to be the originator of the constant service system, and was glad to think that the first town to adopt it was his native town of Nottingham. A committee has been formed, with Sir Frederick Bramwell as chairman, and Dr. W. Pole as secretary, to present Mr. Hawksley with his portrait, to be painted by Mr. Hubert Herkomer, A.R.A., as a mark of respect suitable to the occasion.



The memorial drinking fountain to the late Dante Gabriel Rossetti, erected on the Chelsea Embankment, immediately opposite his house, No. 16, Cheyne Walk, was unveiled on the 14th inst. by Mr. Holman Hunt. The fountain was designed by Mr. J. P. Seddon, and is executed in light-coloured grey granite, the chief feature being the bronze bust of Rossetti, by Mr. Ford Madox Brown, the model of which has been exhibited at the South Kensington Museum.

ILLUSTRATIONS.

DETAILS OF SOME OF THE DESIGNS FOR THE IMPERIAL INSTITUTE.—PULPIT IN THE DUOMO OF GRADO.—CIBORIO AND PALA IN THE DUOMO OF CATTARO.—OAKFIELD, NEAR CHESTER.—POST OFFICE, KNUTSFORD.—SKETCHES AT THE SALE ROOMS.—OLD CABINET, NEWCASTLE-ON-TYNE.—AXBRIDGE CHURCH.

OUR LITHOGRAPHIC ILLUSTRATIONS.

THE IMPERIAL INSTITUTE.

WE continue our series of illustrations this week with two double sheets of detail elevations submitted by the selected architect, Mr. T. E. Colcutt, and by Messrs. Aston Webb and Ingress Bell.

PULPIT IN THE DUOMO OF GRADO-CIBORIO AND PALA IN THE DUOMO OF CATTARO.

FOR description see p. 123.

OAKFIELD, NEAR CHESTER.

THIS shows the various additions it is proposed to make for Mr. B. C. Roberts to his present house, which is inconvenient and unsightly. Some time ago the wing on the left of the picture was built, containing the ball room, which was illustrated in these pages; and the stables seen in the distance were built last year. It is now proposed to case the whole front and sides of the house with red stone, to insert a bay window and mullion and transom windows throughout, and rebuild the porch. The estimate of Mr. Richard Beckett, of Hartford, has been accepted, and Messrs. Grayson and Ould are the architects.

NEW POST-OFFICE, KNUTSFORD.

THIS building has been recently erected by the Committee of Freeholders, and is situate in the old market square of Knutsford, a picturesque old town in Cheshire about 14 miles south of Manchester, and lately honoured in being the headquarters of the Prince of Wales during his recent visit to Manchester, he being entertained by the lord of the manor (Lord Egerton of Tatton), by whom also the site for the new post-office was presented. The buildings have a frontage of 50ft., the size of post-office being 32ft. by 17ft. A shop and dwelling-house are provided in addition to the requirements of post-office; but have been arranged so as to be added when additional accommodation is found necessary. The elevations were designed to harmonise with the surroundings, the style selected being somewhat typical of the various examples to be found in the neighbourhood. The design was selected in competition, and the works have been carried out by Mr. Hy. Pemberton, of Knutsford, under the supervision of the architect, Mr. W. Owen, A.R.I.B.A., 134, Deansgate, Manchester.

Mr. Joseph Bentley, stone merchant, of Rastrick, near Leeds, died suddenly in a street on Friday. Mr. Bentley was 47 years of age, was a large employer of labour, and a member of the local board.

Plans by Mr. E. Harbottle, of Exeter, have been accepted for the remodelling of the town-hall of Sidmouth.

AT THE SALE-ROOMS.

WE illustrate to-day a sheet of sketches from a sale that recently took place at Messrs. Philips, Son and Neale. The oak Corner-Cupboard looks as if it had belonged to the City at one time, as it has the Civic Arms carved on it, and across the bar dividing the panels is the name, possibly of the owner, John Biron. The chair next is a well-made Jacobean Arm Chair of a sort which one sometimes comes across in the vestry of a country church. The oak Writing Table had its sides carved, and was supported by turned legs. The Jacobean Cabinet was rather a good example of that period, and the different and alternate panels in the front give a quaintness to the whole.

OLD CABINET, NEWCASTLE-ON-TYNE.

WHEN I measured the cabinet at the old Castle, of which I send drawings, I made inquiries as to its originality; but the keeper could give me no information regarding it, as it was there before he was put in charge.

GEORGE C. SMITH.

AXBRIDGE CHURCH.

AXBRIDGE is an irregularly-built market town situated at the foot of the Mendip Hills, whose lofty heights shelter it from the N. and N.W. winds, and thus render it peculiarly favourable to the growth of early vegetables, and more particularly the luscious strawberry, of which baskets are daily despatched to Liverpool, Manchester, and the north. The town is supposed to have derived its name from the Celtic "Acs-byrig," the town near the river, and was anciently the centre of a royal hunting forest or chase. Members were returned to Parliament during the reigns of the first three Edwards; after which it was by the desire of its inhabitants disenfranchised. It appears to have been a place of some importance to the Romans, as several of their public roads here intersect one another. The corporation have preserved a series of ancient grants, charters, and other documents, among which are grants from Henry I., Edward I., Edward III., Henry VI.; also an ancient MS., apparently written about the middle of the 15th century, purporting to have been compiled from the ancient charter granted by Edward the Confessor in consequence of his miraculous preservation, as he supposed, from being precipitated over the Cheddar cliffs when hunting near them. The church stands on the side of a hill, and the present building dates from the later part of the 15th century, having probably been built by Henry VII., a statue of whom stands in a canopied niche on the west side of the tower, a similar niche on the east side containing a figure of St. John the Baptist, patron saint of the church. The nave roof is an interesting specimen of work of the date of 1636. The aisle roofs are divided into panelled compartments by beautifully moulded ribs, the intersections of which are covered with square, flat bosses of various designs and excellent workmanship. The edges of the ribs spread into a species of foliation which, though simple in detail, has an extremely rich effect. The characteristic 15th-century font, which was until recently encased with a thick coating of plaster and whitewash, is octagonal, and supported at the corners by eight demi-angels. The church has recently been restored, and may now rank with the finest of those "perpendicular" fanes for which Somersetshire is so justly famous.

W. JANE.

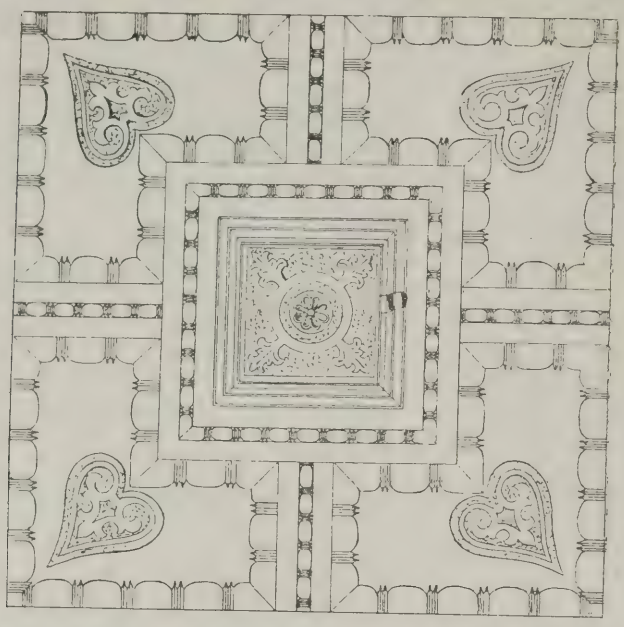
All Saints' Church, the Pavement, York, was re-opened on Sunday week after having been restored from plans by Messrs. Fisher and Hepper of that city. The contractors were: Mr. Hebden, for masonry; Mr. Hartley, plumbing; Mr. Milburn, carving; Mr. Gladin, lead work for the roofs.

Major Tulloch, C.E., an inspector of the Local Government Board, attended at the Castle, Leicester, on Thursday morning, for the purpose of holding an inquiry into the subject matter of an application made by the Billesdon Rural Sanitary Authority for sanction to borrow £15,000 for works of sewerage for the parishes of Humberstone and Evington, near Leicester. Mr. J. B. Everard, the engineer, explained the plans of the scheme.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

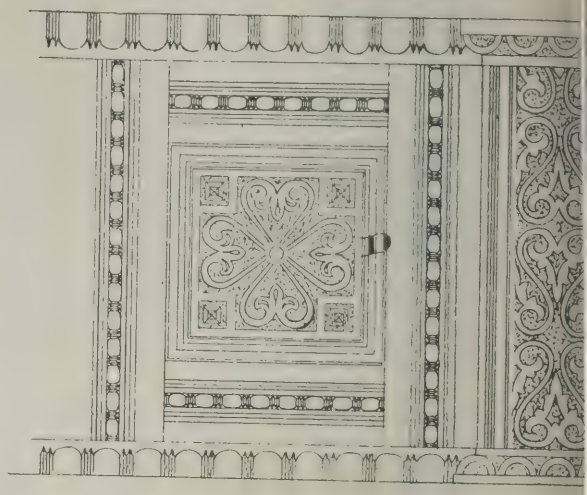
CAMBRIAN ARCHÆOLOGICAL SOCIETY. — A preliminary meeting, held at Denbigh, under the presidency of Colonel Mainwaring, the president for the year, of the above society, has been held with reference to the coming visit of the society to Denbigh in August. Major Lloyd Williams was elected local secretary, and Major Conran treasurer. It was agreed to get up in the Town Hall a loan museum, in which old works of art, paintings, furniture, and the many geographical specimens from the caves of Cefn, Tremeirchion, &c., will be got together. A number of day excursions to places of interest in the Vale of Clwyd were arranged, and in the evenings meetings will be held, and discussions take place on the local caves, the Roman road from Chester to Conway, the foundations of Strata Florida Church, which are now being uncovered by Mr. S. W. Williams, and other subjects.

EAST LONDON ANTIQUARIAN SOCIETY.—On Saturday week this society visited St. Alban's Abbey, the remains of Verulamium, and St. Michael's Church. An hour and a half were spent in an examination, necessarily rapid, of the most interesting features of the cathedral. By the courtesy of the Archdeacon, the party was enabled to inspect every part of the building. Special attention was given to the Mediæval paintings, the brasses, and the screen work. After a few words in the Lady Chapel from Mr. T. S. Widdowson on the history of the Abbey, the members walked down the hill, by the path along which St. Alban had been led out to martyrdom, to the Silk Mills, where Dr. Griffith, of Sandridge, took up the office of guide. He exhibited a copy of Stukely's plan, and engravings of the glass found at the beginning of the century. After detailing the nature of the place and the disposition of the city, so far as could be seen from this spot, the party walked along the eastern wall to the road which runs parallel with the southern wall. By permission of the Earl of Verulam, the party was enabled to follow out the whole line of the Roman wall to St. Michael's. Here the Vicar met the party, and explained the chief features of the church.

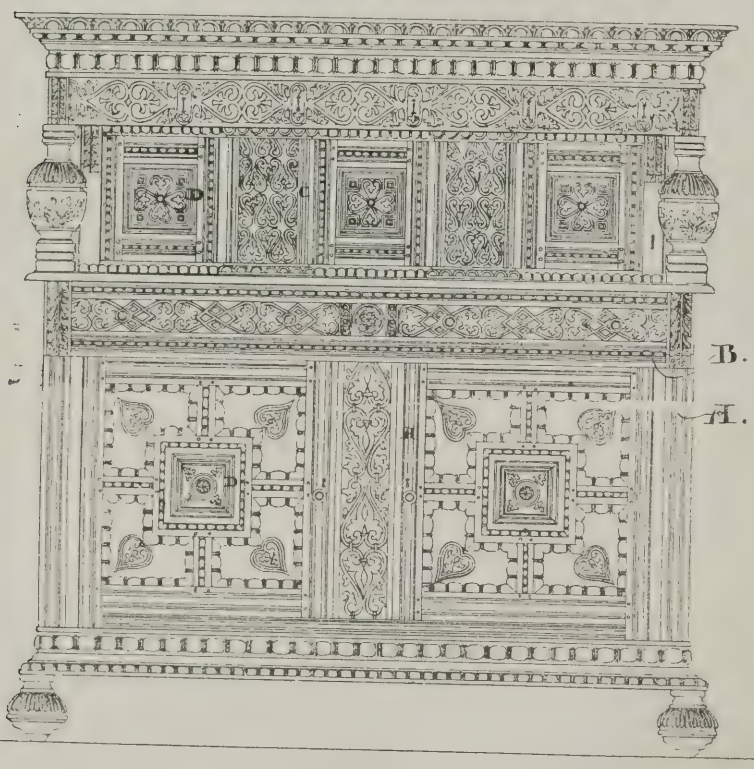


THE ROYAL ARCHÆOLOGICAL INSTITUTE.—The annual meeting of the Archæological Institute will be held this year at Salisbury during the first week in August, under the presidency of General Fox-Pitt-Rivers. The Bishop of Salisbury will preside over the Antiquarian section, the Dean over the Historical section, and Precentor Venables over the Architectural section. The meeting will begin on Tuesday week, the 2nd prox., when the Mayor and Corporation will publicly receive the members of the Institute at the Council-house, and the president will deliver an address. Among the places to be visited besides the city of Salisbury itself are Stonehenge, Old Sarum, Britford, Downton, Wardour Castle, Wilton House, Boyton Manor, the Saxon church at Bradford, and the two Romano-British villages near Rushmore.

ARCHÆOLOGICAL.



OLD MALTON.—The work of restoration at the old Priory Church of St. Mary, Old Malton (the only Gilbertine Priory left in England), is proceeding, and as the floor is being cleared out to its original level (there having been about 4ft. of rubbish above the old floor) some very interesting discoveries are being made. The bases of the octagonal pillars on the north side of the nave are being laid bare, and some beautiful carving is displayed. The Norman pillars on the south side show traces of the great fire which nearly destroyed the church some years prior to the dissolution of monasteries by Henry VIII. Other discoveries of interest are being made, including a carved niche in the north wall, fragments of the old tiled flooring, &c. A large number of human bones have also been turned up, and these are all being put into a large coffin for reinterment.



The tender of Mr. G. Dobson, of Colchester, has been accepted at £3,680, for adding a tower and spire to the church of the Holy Trinity at Wandsworth, from designs by Mr. G. Patrick.

WAYSIDE NOTES.

"THE rolling heap of thunder cloud" has been a very conspicuous object in the heavens latterly, and has brought in its train some refreshing showers, and cooled and cleared the air, besides furnishing the artist with some grand sky-scapes. It is well that our interesting telescopic spire in Fleet-street remains intact; for although it has been said to lack grandeur by reason of its regular gradated composition, it is nevertheless a very pleasing, if not imposing, object, and an undoubted ornament to the Metropolis. From a personal visit to the church, I gather that the reports about the damage to the base of its spire are wholly incorrect. What seems to have taken place is that the electric fluid, after passing comfortably down the conductor, did not find its way so easily when it reached the earth. This, doubtless, was very dry at the time, and did not afford a very good connection. Consequently the "flash" resented this hindrance to its course by knocking up one or two flagstones of the pavement where the lightning-rod enters the earth. Thus it came about that a few pieces of York slab were mistaken for architecturally-wrought stonework!

Electric lighting appears to be steadily, if slowly, making headway. The last town that I have noticed as about to adopt the light is that of Weston-super-Mare. A novel feature in this way is an electrically-illuminated omnibus, running from Liverpool-street to Victoria. Recently passing through the neighbourhood of Chislehurst, in Kent, I observed a board which states that "houses will be erected on this estate to suit purchasers," and that "electric lighting will be supplied to each house." This house-to-house installation, however, would most likely have been quite general by this time had not the enterprise of the various lighting companies been so hampered by the Electric Lighting Act, which, although drawn up with the best of motives, must, nevertheless, be considerably amended if the full capabilities of this method of illumination are ever to be given a fair trial. At present, in the majority of instances, if a householder requires the electric light he must make it on the premises. To draw a fair comparison between gas and electric lighting, therefore, it is necessary to consider the cost that we should incur if we had to manufacture the gas in our back gardens.

Every architect should possess an intelligent knowledge of the general system of electric lighting, although the superintendence of most installations is, or rather ought to be, left to trained electrical engineers. Much of this work, unfortunately, is often looked after by wholly incompetent gasfitters, carpenters, and plumbers, who have no business with the fitting-up of the electric light. The amount of this careless work, which has done so much harm to the cause of electric lighting, is beyond comprehension; and the number and importance of the buildings that are carelessly and unscientifically wired are incredibly great.

What shall we say of the decision of the City authorities to do without a permanent architectural adviser? At first sight it would seem a piece of false economy; but, on mature consideration, it is perhaps wise of the Corporation to decide not to appoint a successor to the late Sir Horace Jones at a salary of about £2,000 a year, but to employ a City *Surveyor* at the comparatively modest stipend of £800 per annum. Such, at any rate, would be the opinion of any lucky architect who might be "called in" to advise the Corporation on architectural matters. But, doubtless, the "architecto-phobists" score, or think they score, a point by the action of the City Fathers.

It is very odd that, although a contractor has been favoured with a knighthood, not one architect (let alone artists and men of letters) has, I believe, been the recipient of any Jubilee honours. The *Echo* of last week asks if anyone can "inform the world why Mr. Thomas Lucas, of Ashtead Park, Surrey, and of Lowestoft, Suffolk, has been created a baronet." Perhaps Sir Thomas is considered to have earned his laurels by the part he took in that extraordinary industry, the Suakim-Berber Railway, an undertaking, however, which is possibly looked upon by the public as more meritorious than any amount of writing or building-designing. The fact of no member of our profession having been knighted must be rather a damper on the high spirits of the enthusiastic embyro architect, as he is usually the gentleman given most to speculating on future honours.

I have noticed lately that quite a large number of old churches have been, or are, in course of restoration. Norfolk and Devonshire especially seem to considerably top the list, and from the numerous paragraphs in the "B. N." *re* restoration, the two counties appear to be vying with each other to get through the most of this doubtful kind of work. I believe it was in a certain town of the latter county that the enlightened inhabitants decided to pull down their old tower and build a brand new one! Of course it is the Jubilee year that has reinvigorated the restoration movement. When Mr. Churchwarden realises the (to him) wretched and dilapidated state of his building, he naturally thinks one of the best methods of celebrating the J——e will be to have his architect friend down from London or elsewhere, and to get him to remove a few square yards of the old golden-stained stones and other time-hallowed work, which straightway disappears for ever.

In the matter of holiday touring and sketching, I would recommend anyone who may be desirous of getting his drawings reproduced in the professional journals to endeavour to strike out in fresh woods and pastures new, as if he can but secure some little-known and unsketched subject he unquestionably stands a better chance of getting his drawings published than if he simply produces an averagely veritorious likeness of some well-known and hackneyed building.

In our own country, and certainly in Scotland and Ireland, there must be much old work which has never been introduced to printing ink in any shape or form. And on the Continent it would be often well to run through the known towns and stop at the smaller and less frequented villages to hunt up something new. One gets so sick and tired of seeing sketches of the typical Normandy chateaux, Flemish town-halls, and the hackneyed cathedrals everywhere, that it would be an interesting relief to get some new thing. When a building gets so overdone by sketches, the only course left is to make a set of drawings of it from a lot of different points of view! For do we not read of a certain personage who was so fond of a particular English Cathedral that he had representations of it from all possible points of site—from the north, south, east, and west, &c.—a gentleman, was it not, by the name of Pecksniff?

It is reported that the older routes to the Continent by way of Dover and Folkestone are feeling the effects of the competition of the Harwich service of boats to Antwerp and Rotterdam. Certainly the latter route, though lengthy, is very well managed, and the steamers are good. Although I have never been *to* the Continent viâ Harwich, I have returned thence by way of that East Anglian town.

And a very pleasant journey it was: running down the placid Maas in the evening, with a crimson sunset sky reflected in its waters in a very charming manner, and which outlined in the deepest purple the flat horizon of the quaint Dutch country, only broken by the masts and sails of the swiftly-passing home-returning craft that for the moment looked black against the brilliant sunset. And when the sun had sunk in the west, and nothing but the crimson stain was left in the sky, the dark surface of the river was radiant with the glowing light of phosphorescence, causing the spray from the ship's bows to resemble a fountain of liquid silver, and which shone out of every little wave in our wake whenever they curled themselves and broke into foaming spray. No less beautiful, by contrast to this warm-coloured autumn evening, were the cool tints and chilly air of the following morning, when, after rolling about in the North Sea for many hours, the brilliant star and moon lit night gave way to the cold grey tints of early dawn. For at daybreak we were in the track of those steamers of many types that follow one another in a ceaseless run round our eastern coasts; we were apparently in a fleet of looming hulls and twinkling side and head lights. I have seen few seascapes that have equalled in beauty that of this early September morn, when, after passing through the racing ground of countless merchant vessels, we sighted the old English shores—low-lying hereabouts, it is true, but very quaint and interesting in the early morning light.

GOTH.

CHIPS.

The receiving orders under the Bankruptcy Act of 1883 announced in Friday's *London Gazette* includes the names of Thomas Mitchell, late of Oldham and Manchester, now of Chorlton-on-Medlock, architect and surveyor; Faulkner Lee, Devonshire-street, Great Portland-street, surveyor; Richard Curtis, Aldersgate-street, E.C., builder and contractor; Arthur Martin Bailey, Southampton, builder; Thomas Wyatt Ediss, Newhaven, builder; and Henry Tommy, Wem, Salop, builder and contractor.

Mr. James Wallace, a well-known builder in Newcastle-on-Tyne, died on Thursday in last week aged 83 years.

The Eastbourne Corporation were the complainants in a County Court suit, before Judge Martineau, on Friday. They sued a builder named Cornwall for £45, rent of land on the sea front. The defendant contended that the official seals were not affixed to the agreement between himself and the Corporation, but admitted being in possession of Corporation land for building purposes. The Judge gave a verdict for the Corporation.

At the last meeting of the School Board for Leeds Mr. W. Landless, of Glasgow, was appointed from among 66 candidates clerk of works for the Central Higher Grade School (Messrs. Kelly and Birchall, architects), at a salary of £5 5s. per week.

An address has been presented to the chairman of the Metropolitan Board of Works on behalf of the district surveyors of the Metropolis, offering their congratulations on his elevation to the peerage. In reply, Lord Magheramourne has expressed the hope that his relations with the district surveyors may continue to be of the same cordial character as they have been in the past.

The Bishop of Liverpool will consecrate the new church of St. Benedict's, Everton, on Tuesday week, August 2, and the new chancel of the parish church, Haigh, Wigan, on the following day.

A new Baptist chapel in Cromwell-road, Skeldergate, York, has been opened this week. Messrs. Benson and Minks, of Blake-street, York, designed the building, which seats 300 persons, and the work has been carried out by Mr. Jackson, the contractor for the stonework, &c., and Mr. Dent, the woodwork contractor. The frontage is of red Lincolnshire bricks with stone dressings, and the building has an open roof, stained, the walls being plastered, with wooden dado around.

Sir Richard Wallace has just accepted the tender of Messrs. James Vernon and Sons, of Lisburn, for the enlargement of the assembly rooms in that town, at a cost believed to amount to nearly £2,000, and has also offered £500 for the enlargement of the Cathedral Church of Connor and Dromore in Lisburn by the addition of a chancel.

A new Primitive Methodist chapel at Mablethorpe, on the Lincolnshire coast, was opened last week. It is built of red and white bricks, with pitch-pine seats and other fittings, and accommodates 130 persons. Messrs. Dabb and Allott were the contractors.

The Marquis of Hartington opened the new municipal buildings at Barrow-in-Furness on Friday. Designed by Mr. W. H. Lynn, R.H.A., of Belfast, the buildings form a parallelogram in Duke-street, one of the main thoroughfares, the principal entrance being in Cavendish-square. There is a central tower 170ft. high, with wings north and south. The south wing is devoted to municipal offices, and that to the north on the ground floor to the Free Library and museum, and on the first floor to the civic department, with council chamber, reception-room, and banqueting-room. The building is of red sandstone. The tower is fitted with a clock and bells, furnished by Messrs. Gillett and Co., of Croydon.

A new pier has been erected at the Blue Boar-hard, Rochester, a spot where the wreck of a previous pier has for many years stood. The new structure is of wood, and has been built by Mr. Hocking, from the plans of the city surveyor, Mr. William Banks.

Building Intelligence.

ABERDEEN.—The new swimming baths being erected at the foot of Constitution-street are now approaching completion. The baths are near the sea, and salt water is to be introduced into the building through 9in. diameter cast-iron pipes. The building is two stories in height. The front portion on the ground floor contains the entrance lobbies and staircase, ticket office, keeper's rooms, waiters' rooms, and refreshment room; and on the upper floor the principal features are a billiard room and smoking room. On the left-hand side of the front building are situated the steam-boilers and pump room, immediately above being the cisterns and filter. The swimming baths are in the rear wing, and measure 109ft. by 48ft., the main bath being 75ft. by 30ft., with a depth at one end of 3½ft., and at the other of 7ft. Dressing boxes are ranged along the sides. About 800 people can be accommodated in the promenade or gallery. At one end of the bath space has been left for a gymnasium. The baths will be supplied with both fresh and salt and hot and cold water. The architects were Messrs. Jenkins and Marr, C.E., and the cost of the baths will be about £6,000.

CANTERBURY.—The sanctuary of Canterbury Cathedral has just been beautified by the placing of sculptured figures on the stone screen on either side of the altar. The figures are as follow:—Angel of Peace, St. Ithuriel, St. Gabriel, St. Michael; angel with violin, angel with censer, angel adoring St. Uriel, St. Raphael, angel with organ (St. Cecilia), angel with censer. Three more figures have yet to be added. Over the doorway on the south side a figure of the guardian angel has been placed. The sculptors are Messrs. Wall, of Cheltenham. Some diaper work of 14th-century character at the base of the screen also adds to the ornamentation of the east end of the choir.

ELIE, N.B.—The Wood Memorial Church, Elie, which has been built from designs by Mr. Sydney Mitchell, Edinburgh, was recently opened. In plan the church is cruciform, and consists of a broad nave with double transepts on each side and a semi-octagonal apse. The tower is placed in the centre of the front, a very frequent arrangement in old Scottish churches. It rises from the ground without any buttresses, and finishes with a parapet corbelled out from the wall face, and from the inside of this rises an octagonal wooden spire. The spire is made up of two slopes, which gives it the slightly curved form which distinguishes many Scottish spires from the cone-like outline of those in England. The fenestration of the nave consists of simple narrow pointed windows, arranged in pairs, while those in the transepts are arranged in triplets. The whole interior of the church is lined with pressed red bricks, specially made, being only 2½in. high, instead of the usual 3in. All the arches and the jambs of doors and windows are of dressed stone. The apse is raised two steps above the general level of the church. It is lighted by six windows, arranged in pairs, separated by a column of black Frosterly marble. The pulpit, of wood, panelled, stands on a stone base. The passages and apse are laid with tiles, the rest of the church being floored with wood. The church is seated for 400, and cost about £4,000.

EDINBURGH.—The new public baths in Infirmary-street, constructed from plans by Mr. Morham, city architect, at a cost of £10,000, will be opened on Monday next. The baths include a large swimming pond for men, a smaller one for women, and a complete set of plunge baths in each of the two divisions into which the building is divided. The men's bath is 80ft. in length by 40ft. in breadth, and varies in depth from 3ft. to 6ft. 6in. Around it is a broad platform, on which is a series of dressing-boxes for the bathers. At one end of the bath is a club or reading-room, and adjoining it is an apartment for the bathmaster and a store for napery. At a height of 11ft., and carried on iron columns, there is a gallery with open iron front. In this gallery are placed the plunge baths—31 in all, and lavatory accommodation is provided on both floors. The women's swimming bath is 50ft. by 25ft., and in depth runs from 2ft. 6in. to 6ft. It has only dressing-boxes on one side, and above these is a gallery on which are placed nine single plunge baths. In both swimming baths the bottom is laid with white tiles, with broad black bands; the sides and platform are red cement, and the walls are lined with white enamelled bricks. All the woodwork is of pitch-pine, varnished. Both baths have open-timber roofs. Over the entrance hall eight first-class plunge baths have been fitted up. The boiler is 28ft. in length by 7ft. 6in. in diameter, and there are two steam injectors in the men's bath and one in the women's. A chimney rises to a height of about 100ft.

FORD, LIVERPOOL.—The new church, built at a cost of £6,000, in connection with the Convent of the Good Shepherd at Ford, was opened on Sunday week by Dr. O'Reilly, Roman Catholic Bishop of Liverpool. Two hundred penitents at present find refuge in the home, and it is principally for their convenience that the new church has been built. The new church is so built as to accommodate three congregations, each invisible to the other and yet each able to see the altar. The large nave has been divided by an arcading and screen. On one side are seated the 200 penitents, and on the other the sisters, whilst in a transept the general public are accommodated. At the end of a church is a gallery, in which are the choir and the organ. The naves are each 88ft. in length, and the width across is 52ft. Over the altar rises to the height of 72ft. a lantern tower, the height of the roofs of the naves being 54ft. The transept for the general congregation is 40ft. long. There is adjoining this transept a small Lady chapel. Confessionals have been built for the sisters, the public, and the penitents, and off the corridor on the eastern side of the church are a number of parlours, connected with the convent by covered passages. All the buildings have been constructed with red brick and dressed with stone from Bootle. The architects are Messrs. Pugin and Pugin, of London; the contractors, Messrs. Robinson and Robinson, of Liverpool; and the clerk of the works, Mr. Travis, of Bootle.

HIGHAM, SUFFOLK.—The parish church of Higham is about to be restored from plans by Mr. E. Fearnley Bishopp, of Ipswich. The contract for the first section of the work has been taken at £965 by Messrs. Henry Everett and Son, of Colchester. It is proposed to place a new roof over the north aisle, and to build a new north porch; to rebuild the north arcade and reframe the nave roof. The building is to be refloored throughout, the high pews in the nave and aisles replaced by open benches, and new oak altar railings, prayer desk, and stalls will be erected in chancel; the western gallery is to be removed, and all stonework and glazing repaired. A new pulpit will also be erected.

HYDE.—On Saturday week the foundation stones of the Victoria Jubilee Wesleyan Day and Sunday Schools were laid. On the ground floor are infant school, 48ft. by 31ft. 6in., with classroom adjoining, the latter 25ft. by 15ft. 6in., and containing gallery; lecture-room, 22ft. by 16ft.; classroom, 25ft. by 15ft. 6in.; tea-preparing room, 16ft. by 8ft. 6in.; boys' and girls' lavatories and latrines. On the first floor will be a spacious assembly hall, 65ft. by 31ft. 6in., with an open-timbered roof in pitch-pine, and on one side will be large classrooms for the young men and women, each measuring 25ft. by 15ft. 6in. The schools, which are in the Gothic style, will be faced with local bricks, relieved with sandstone dressings, and Ruabon terracotta, and slated with blue slates, capped with red ridge tile. The contract for the work has been let to Mr. S. Robinson, Hyde, the designs having been prepared by Mr. A. Banks, Oldham, who was the successful architect in a limited competition.

LEEDS.—The Leeds School Board received a report on Friday from a committee recommending that Mr. J. P. Kay be appointed architect of the Moortown School, Mr. Corson of the Green-lane School enlargement, and Messrs. Kelly and Birchall of the Richmond-hill School. Mr. Wilkinson asked what were the terms upon which the architects had been appointed. Mr. Fawcett (chairman of the committee) said that some time ago a memorial was presented to the board from the Leeds and Yorkshire Architectural Society, asking that the erection of the schools should be taken out of the hands of any special architect, and should be left open to the profession generally. The committee had a meeting, and came to the conclusion to comply with the request; but they felt that they ought to know exactly what they were going to pay. The work they intended to include in the architect's commission was a little above what was ordinarily included. It embraced the survey of the sites, the taking of levels, the drawing of sketch plans, the preparation of quantities, lithographing, and so on. It was upon that basis that they agreed with Messrs. Kelly and Birchall for the work at the Higher Grade School for 4 per cent. The committee sent out a lithographed circular asking what commission they would charge on the erection of schools, so that the board might know what they would have to pay. They got answers from all the architects with the exception of two or three. Mr. Kay, of Park-square, agreed to do the work at the Moortown School for 3½ per cent., which was accepted, as were also the offers of Messrs. Kelly and Birchall for the Richmond-hill School at 3½ per cent., and of Mr. Corson for the Green-lane School at 4 per cent. Canon Bullock asked how it was that Messrs. Kelly and Birchall had taken the Richmond-hill School at 3½ per cent. while they were paid 4 per cent. for the Higher Grade School, which was a larger job still. Mr. Fawcett said he had no doubt that the Richmond-hill School would pay Messrs. Kelly and Birchall much better than the Central Higher Grade School. Mr. Kelly had had to go to Scotland and into almost every county in England for the purpose of gaining information on the subject of the erection of the Higher Grade School. That would not be necessary in regard to the Richmond-hill School. The recommendations were adopted.

NORTH SHIELDS.—The foundation-stone of the Tynemouth Victoria Jubilee Infirmary was laid in Hawkey's-lane, North Shields, on Tuesday. The buildings face south, and are planned on the pavilion system. The administrative block occupies the central position, with sick-wards, as wings, 24ft. apart, on either side, arranged at right angles to the longitudinal axis of the buildings, with which they are connected by a corridor. Each ward is 32ft. long, 24ft. wide, and 13ft. high, and contains eight beds (but when the building is extended northwards each wing will have eight more), and a separation ward 12ft. square, for one bed; adjoining these are two rooms for the nurse, and a duty room. At the south end of the wards is a large bay window seated round. The officers are placed at the extreme ends of the corridor, from which they are separated by double doors, ventilated between. Advantage is taken of the rising levels, to obtain a subway under the corridor, in which are placed the hot-water and other pipes. The administrative block contains, on the ground floor, matron's and board rooms, each 16ft. by 15ft., storeroom for sickroom requisites, bathroom, operating and drug room for medical staff; kitchen, scullery, storerooms, and pantries. The heating and coal cellars are placed in the basement. On the first floor are situated the doctor's rooms, bedrooms for matron, nurses, and servants, bathrooms, &c. Over the central entrance will be erected a tower, and in the north-west corner of the grounds are the wash-house, laundry, and drying closet in the north-east corner a small mortuary. The walls, which are hollow, are to be built of thin, red bricks with stone dressings, and the roof to be covered with green Cumberland slates. Mr. F. R. N. Haswell, F.R.I.B.A., of North Shields, is the architect.

OLDHAM.—The Primitive Methodist chapel and schools, Lees-road, Oldham, have recently been reopened after extensive alterations and additions. The chapel has been supplied with new pitch-pine pews and rostrum, and the upper floor of the school has been divided so as to form a number of classrooms. Other improvements have been effected, a new staircase has been erected, and special attention has been devoted to the ventilation of the chapel. The whole of the work has been carried out by Mr. Lees, builder, Oldham, from designs prepared by and under the superintendence of Mr. A. Banks, architect, Oldham.

WOODFORD.—Prince Albert Victor visited Woodford on Saturday afternoon, for the purpose of laying the foundation-stone of the build-

ings of Bancroft's School. This school was founded in 1728 by Francis Bancroft, a member of the Drapers' Guild, and has until recently been situated in the Mile-end-road, on the site now occupied by the People's Palace. The new buildings, to be erected at a cost of £50,000, which has been voted from the corporate funds of the Drapers' Company, will contain accommodation for a largely increased number of scholars, and in addition to 100 boarding foundationers, received in the old school, there will now be a day scholars' department for 200 boys. Mr. A. W. Blomfield, M.A., F.S.A., is the architect of the new building.

Engineering Notes.

ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.—The annual meeting of the Association of Municipal and Sanitary Engineers and Surveyors was held at Leicester on Thursday, Friday, and Saturday in last week, Mr. Joseph Gordon, the borough surveyor and engineer, in the chair. There was a good attendance on Thursday, among those present being Sir Robert Rawlinson, C.B.; Major Tulloch, Inspector of the Local Government Board; Mr. R. Vawser, of Manchester, and J. Lobley, of Hanley, past-presidents; Mr. Hewson, of Leeds; Mr. E. G. Mawby, York; Mr. Howcroft, Redcar; Mr. J. Gledhill, Heckmondwike; Mr. A. Creer, Lancaster; and Mr. J. G. Hodgson, of Rotherham. The members were cordially welcomed by the Mayor (Ald. Hart). The annual report was read, and showed that 44 new members had joined, including five graduates, while the total strength of the association was six hon. members, 285 ordinary members, and five graduates, and the balance in hand £288. The President then delivered his address, which dealt with modern water carriage, system of sewerage, with the difficulties it involved, of river pollution and sewer gases, and referred to what was being done in flood prevention and sewerage works in the borough. The afternoon was devoted to a drive round places of interest, including old Town Hall, the Roman Pavement, the Public Baths, Bath-lane, and various factories and workshops, followed in the evening by the annual dinner at the Masonic Hall. On Friday a paper was read by Mr. G. Strachan, of Chelsea, on "Asphalte and Concrete Pavements" in the morning, and in the afternoon members visited various works recently executed and in progress in the borough, and at 6.30 attended to a garden fête at Ashleigh, Knighton, the residence of the Mayor. On Saturday the Victoria Stone Company's Works at Groby, Bradgate reservoir and pumping station, Mount Sorrel Granite Quarries, and the Barrow Hydraulic Lime Works were inspected.

CITY OF LONDON AND SOUTHWARK SUBWAY.—An inspection of the works now in progress for the City of London and Southwark Subway was made on Friday by a party of visitors from the Society of Engineers. The party were received by Mr. J. H. Greathead, M.Inst.C.E., the chief engineer, at the pier at Swan's Wharf, behind which a staging has been erected, whence a shaft has been sunk to the depth of 80ft. in the river bed, and where a descent was made. The subway begins near the Monument, King William-street, passing under the streets and the river Thames, and terminating at the Elephant and Castle; but by an extension, now awaiting the Royal assent, the line will be carried to the Swan at Stockwell. There will be four intermediate stations—at Great Dover-street, the Elephant and Castle, New-street, Kennington, and at the Oval. The up and down lines are to be taken in two separate tunnels of iron, each 10ft. in diameter inside, and constructed almost entirely under the main thoroughfares from end to end through the London clay, and at such a depth and in such a manner as to avoid all interferences with pipes and sewers and property along the route. The mode of construction adopted is very simple; a steel "shield" overlapping the forward end of the iron tunnel, 26ft. in length, is driven forward by hydraulic power as the material is excavated from before it, and the flanged segments of the iron lining, 1½in. thick, are built up inside and under cover of the shield into successive rings about 1ft. 7in. long. As the shield is moved forward, the annular space around the iron tunnel, left by the advance of the overlapping steel plate of the shield, is filled up by a system of "grouting," the invention of Mr. Greathead, hydraulic cement being ejected from the inside of the tunnel by air pressure. At each of the stations, in addition to the stairs, there will be hydraulic lifts for raising and lowering the passengers direct between the street levels and the platforms. The hydraulic power for working the whole of them will be derived from the engine station at the Elephant and Castle. The trains will be propelled by a system of endless cables, and light trains, taking passengers every two minutes, will be run. The main contract for the subway is being carried out by Mr. Edmund Gabbutt, of Liverpool, Mr. E. Jones being the acting manager, and already both the tunnels have been completed under the Thames and for a considerable distance north and south of the river. The total cost of the work, which we described in greater detail in our issue of the 25th of February last, page 266, is estimated at about £550,000.

CHIPS.

The town council of Truro, at their last meeting, instructed the city surveyor, Mr. W. Clemens, C.E., to prepare a scheme for disposing of the sewage of the city, which at present empties in its crude state into the rivers Allen and Kenwyn.

Plans for proposed new business premises in Victoria, Vancouver's Island, B.C., have been prepared for Mr. Thomas Allsop, of Victoria and London. The buildings will be erected at the earliest opportunity on land fronting Government-street, to which they have a frontage of 60ft. The proposed premises consist, on the ground floor, of commodious shops or stores, and a main entrance to the office above. The latter will be provided with every modern convenience. Mr. R. Owen Allsop, of 37, Norfolk-street, Strand, London, is the architect.

The trustees of the Kirkleatham estate have offered 16 acres of valuable land to the local board for pleasure gardens. Mr. J. Howcroft, their surveyor, has received instructions to prepare plans for laying out the same. The board have also decided to extend the sewer outfalls through the rocks to low water, as recommended by their surveyor.

The alterations and additions to the vicarage of St. Paul, Lorrimore-square, S.E., are now approaching completion, from designs and under the superintendence of Messrs. Frederick W. Fryer, M.S.A., and Frank Golding, of London, E.C. Mr. Tinson is the builder.

The organ in Bromesgrove parish church was re-opened on the 14th inst., having been reconstructed and enlarged by Messrs. Nicholson, of Worcester.

It is now definitely arranged that Truro Cathedral shall be opened in October, in the presence of the Prince and Princess of Wales. The ceremony will take place probably in the last week in that month. The Archbishop of Canterbury will also be present.

A large block of premises has just been completed, being 372, Euston-road, N.W., on the site of an old building burnt down. The elevation is of red brick and Bath-stone dressings. The joinery is of oak. Adjoining these premises the beautiful Gothic entrance gateway to Messrs. Gray and Davidson's organ works, designed by the late Sir Gilbert Scott, and erected some 20 years ago in Caen stone, was found to be in such an advanced stage of decay that it was found absolutely necessary to rebuild with the exception of the base to plinth, which is of Aubigny stone. It has now been reproduced—with the exception of some slight modifications to meet contingencies of new building—in Bathstone. The sculpture and carving generally is the work of Messrs. Kelsey, of Regent's-park. The contractor was Mr. W. A. Rhodes, Hyde-park. Mr. Frederick W. Fryer, M.S.A., was the architect for the whole of the works.

In connection with the Jubilee celebrations, a new reredos was erected in Scholes Church, near Cleckheaton. The structure is of oak, consisting of three panels filled in with emblems, painted on zinc of a gold ground. A memorial brass lectern was also placed in the church at the same time. Both these works were executed by Jones and Willis, of Birmingham and London.

St. Sidwell's parish church, Exeter, is to have its chancel fittings made more complete by the acquisition of carved oak stalls. They are the gift of the late rector, and are being made by Mr. Harry Hems, of Exeter, from special designs prepared by Mr. R. Medley Fulford, of that city.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—P. Son and N.—W. C. and Son.—C. T.—E. F. and B.—S. L. B.—G. and Co. (Ltd)—J. A. and Son.—W. G. and Son.—E. Son and Co.—T. N.—E. G.—L. B.—J. H. and Co.—F. and Co.—A. C.

ALARIC. (If only thirty or so copies are required, one of the "graph" processes will answer. Soak one part of glue in water overnight; pour off the water, melt the glue, and add four parts of glycerine, and sufficient whiting or barytes to colour the mixture, with a few drops of carbolic acid to preserve it. Pour out into flat trays and skim the bubbles off the surface with a card. Write on note-paper with aniline violet dissolved in spirit, and transfer to the composition. Then take copies, by laying clean paper on the transferred ink and drawing the hand steadily over the back with slight pressure. You can purchase the apparatus cheaply nowadays, or the trypograph, cyclostyle, &c., the latter being stencil processes.)—H. T. P. (Yes, always.)

Correspondence.

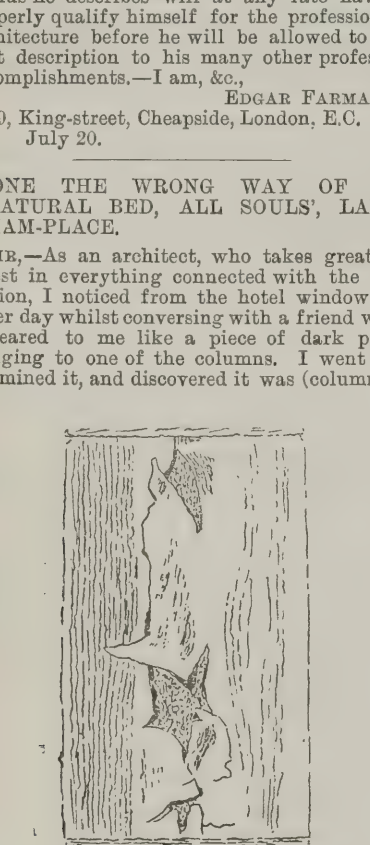
ARCHITECTS AND THE REGISTRATION BILL.

To the Editor of the BUILDING NEWS.

SIR,—In most employments the rewards resulting from success, and the discredit of failure through incompetency, form as a rule sufficient security to the public against incompetent practitioners; but certain professions are productive of such serious evils when improperly exercised, and at the same time open to be followed by unqualified persons, that it is right, in the interests of the members of such professions and for the protection of the public, to subject such persons to the restraint of legal regulation.

On all sides it is agreed that the profession of architecture and its branches is one of these, and "Invicta," in his letter published in your last issue, gives additional evidence of the necessity of the proposed Act. In my letter I cited one case only of loss of life through the employment of a person incompetent to carry out the work intrusted to his care, with a view to show the desirability of the compulsory registration of architects. "Invicta" takes exception to my letter because I only mention

one case, and proceeds to show from his own personal knowledge that it is not the outsiders alone who bring the profession into disrepute and endanger the public, but that it is the architects themselves who in many cases are incompetent.



It is evident, however, that your correspondent is not aware of that unwritten law which in legislation of this kind jealously guards vested interests, and what was done in the other closed professions must be followed with regard to that of architecture; but after the passing of the Act, "Invicta" will learn, if he will read the Draft Bill, that the versatile genius he describes will at any rate have to properly qualify himself for the profession of architecture before he will be allowed to add that description to his many other professed accomplishments.—I am, &c.,

EDGAR FARMAN.

39, King-street, Cheapside, London, E.C.
July 20.

STONE THE WRONG WAY OF ITS NATURAL BED, ALL SOULS', LANGHAM-PLACE.

SIR,—As an architect, who takes great interest in everything connected with the profession, I noticed from the hotel window the other day whilst conversing with a friend what appeared to me like a piece of dark paper clinging to one of the columns. I went and examined it, and discovered it was (column A)

actually a portion of the stone peeling off like a skin, and writhing, as it were, under the heat of the sun.

Now, what has caused this? Some who know more than others (?) would say, "Oh, the wrong way of the bed!" It certainly is set the wrong way of the bed, and may have been bedded *hard* on the outer radius of the beds of the stone, which would be liable to fracture when the weight came thereon, and rain, frost, and other elements have penetrated and followed *down* some of the coarser particles of grit, and liberated the closer material, which appears to have been warped outwards by the sun's influence (see Cardinal point). But this is only one side of the question; for on walking round to the easterly side of the church I found a similar stone in the column marked B; but it is perfectly sound, although bedded the reverse of its quarry bed. I then thought that, apart from the sun's influence, prevailing winds might affect one more than the other. I only fixed the north point according to time and the shadow of my stick on the path, so that I do not give it as accurate; the magnetic north may be a few points west of my sketch.

However, the part affected on Column A appears to have had its weak point attacked by the winds from south to north, or within a few degrees of either—wet attacks. The Column B appears to have escaped the influence of the sun, especially the stone therein which is not placed on its natural bed, but it has been exposed to the winds from the south and east more particularly.

Here, then, is a fact that we have two stones forming part of two columns, one to the N.W. and the other to the S.E., say 100ft. apart, doing precisely the same duty, and both set the wrong way of the bed, yet one is "going" rapidly and the other appears quite sound.

I can only think that the stone shown in Column A must have been of a more open vein in parts, and if it had been placed on its natural bed the destructive attack as now shown would not have been developed thus; it would have appeared in horizontal honeycombed pittings or perforations.

Being an enthusiast in the profession must be the apology for these remarks.—I am, &c.,

H. T. PERCIVAL, Architect and Surveyor.

Calais.

CLERKS OF WORKS TO H.M. OFFICE OF WORKS.

SIR,—On behalf of my fellow-competitors and myself, I think it right to say that our best thanks are due to Mr. Isaacs, M.P., for his esteemed efforts in our behalf, and his kind and courteous treatment stands out in marked contrast to that which we have experienced at the hands of H.M. Civil Service Commissioners.

I think the correspondence which has taken place by your kind permission in these valued columns is *overwhelmingly* sufficient to prove that the reply framed for Mr. Jackson is evasive and untrue! I also wish to say no blame must be attached to Mr. Jackson for such, as I am thoroughly convinced a gentleman of his position will view with indignation the deception practised upon him. It is very evident there are those at Cannon-row who are on excellent terms with themselves, and entertain curious ideas as to their infallibility; but I think Englishmen in general rather appreciate those who have the courage to admit their faults than those who uphold wrongs.

The time may come when the authors of this statement of Mr. Jackson's may feel disposed to invest their private funds in bricks and mortar, and I hope they will still cling to the theoretical man of 25 minutes' practical experience, as it will then teach them a lesson not readily forgotten, and perhaps enable them to look a little more considerately on the claims of the practical man. Further comment is needless.

Trusting you will pardon me for again troubling you, and find room for this letter in your next,—I am, &c.,

T. F. MAY, Clerk of Works.

New Post Office, Leicester, July 18th.

DRAINAGE AND SANITARY FITTINGS.

SIR,—On p. 983 of BUILDING NEWS for June 24th, Mr. Bruce said, "I will encroach no further, although Mr. Buchan may make numerous absurd statements for sake of contradiction." It seems he has not been able to keep to his word, for on page 86 of the BUILDING NEWS of to-day's date there is another letter from Mr. Bruce, in which, so far as I can judge, it is he who is the individual who makes "absurd statements for sake of contradiction."

In his opening paragraph Mr. Bruce, in reference to the diagram on p. 52 of the pipe A C, with its right-angled branch B, accuses me of "a deliberate misstatement," in putting under it "Buchan's 1887 and Bruce's 1885 Round Opening or Eye B," and goes on to imply that there is nothing of the sort in his 1885 specification, but refers to "a metal gas and watertight cover for inspection eyes, made square, oblong, or round."

Now, it seems to me Mr. Bruce has both a bad memory and very little gumption, for Fig. 6 of *his own specification* shows the sort of pipe in my diagram on page 52, while line 42, page 4, says, "A4 is an upturned branch pipe." Further, I cannot see the word "oblong" in Mr. Bruce's specification, nor in the half-page of errata, or "clerical errors," prefixed to it; neither could my clerk see it. Perhaps Mr. Bruce will kindly point out the page and line in which "oblong" occurs, or, if this is a misstatement, he might apologise.

I think Mr. Bruce should have allowed Shoebridge's ghost to rest with Spencer's, *et sui generis*—it has only been a will-o'-the-wisp to him.

I am not aware, supposing it is true, that Messrs. Brown, of Paisley, have made traps with my sharp-edge and cascade, which are more self-cleansing than those made by my authorised makers, Messrs. J. and M. Craig, of Kilmarnock; that, therefore, either Messrs. Brown or Mr. Bruce are justified in making and selling them as "Bruce's traps." This is more an attack upon Messrs. Craig as *makers* than upon me as inventor and patentee. I do not admit the impeachment, however, either in the foregoing or in the further words on page 86, "Mr. Buchan . . . has not been able to construct a clean working trap with a good deep seal."

Seeing that "Buchan's" trap, as made by Messrs. J. and M. Craig, obtained the only medal for traps at Glasgow in 1880, the Gold Medal in London in 1884, and Messrs. Craig also got the Gold Medal in Edinburgh last year for their manufactures, and about 60,000 of these traps are in use, Mr. Bruce's assertions seem to me to be an ill-natured, impudent insult to the judges of these exhibitions, and also to the numerous architects and medical men who have specified and recommended them.

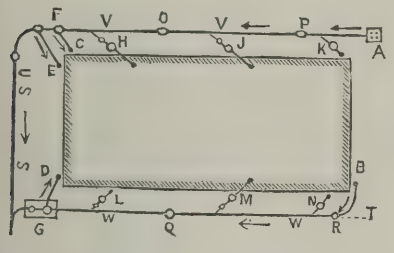
Mr. Bruce refers on page 86 to my lawyers having attacked Messrs. Brown, of Paisley, for selling so-called Bruce's traps with sharp edge and drop, which are considered to be an infringement of Buchan's prior patents, and he goes on to say, "I beg to inform Mr. Buchan that this trap will be made and supplied to the public on my responsibility until Mr. Buchan can make good a case of infringement against me." Now, in reply to this I beg to inform Mr. Bruce and the public that, although Mr. Bruce on the 9th inst. wrote to his manufacturers, Messrs. Brown, in his high-flown "responsibility" style, they yet, two days *after*, wrote to my lawyers: "In the mean time, and until the matter is arranged, we have discontinued the making of the traps."

Mr. Bruce, on page 86, attempts to show I am inconsistent in condemning the hollow or basin behind the edge of his Figs. 1 and 3 A.D. 1885 trap as nonsensical and ridiculous, and yet attacking his makers for infringement. This is easily explained, as I look upon the hollow as a sham, which, if made an inch or more deep, could be easily filled up with cement. (Is this, which some might style a dodge, intended?) But hollow or no hollow, my sharp edge with drop are shown by Bruce, and in the so-called "Bruce's trap" bought a few days ago, before I asked my lawyer to write Messrs. Brown, my sharp edge and drop are fully developed, while the hollow is so slight as not to be readily observed unless specially looked for, and, as I did, put a straight-edge in trap and try to slip a half-crown in below it. In forming a sharp square edge of my traps, Messrs. Craig's men, before 1885, sometimes left an infinitesimal depression or hollow like this behind the edge, but it was left for the genius of a Bruce—alas for the hope of a second Bannockburn—to patent this malformation as an *improvement!*

Then, as for the round-edged trap with drop shown in Figs. 5 and 7 of Bruce's 1885 specification, I beg to state that round-edged drop-traps were largely sold before 1885, and the public have often been imposed upon by having such palmed off upon them for Buchan's traps by unscrupulous merchants or their employés, and by tradesmen; but sometimes the imposition when discovered caused considerable loss to the tradesman or seller. These round-edged or emasculated traps allow the water to often flow away quietly below the paper and soil, leaving them exposed; so why Mr. Bruce in 1885 should show this round edge in his patent specification as if it were either a novelty or an improvement passes my comprehension.

As to Mr. Bruce's attempt to criticise my rough plan of Armadale Castle drainage, it reminds me of the beadle in the pulpit; but as

I am neither too old nor too conceited to learn, I give him a chance to teach me, so let him explain where he would have put the manholes to be better. Also, what use for going to expense of manholes at junctions of rainpipes with the leading drain? Also, what good to be served by ventilating the branch rain-drains?



As to Mr. Bruce's assertion that the drains below the floors are put in "without any means of access at the branches," I may mention that when I told this to the man who did the work, he replied, "He's bletherin'. He does not know what he is talking about; access can be got in ten minutes."

As to the plan of putting in a manhole at the junctions of a number of the branch drains, in soft ground outside, the idea is pure bunkum, and would have been a useless waste of money, and not made such a good job for the inmates as the way in which the work is done, so I entirely disagree with Mr. Bruce as to these. I am all the more inclined to this as my style of work pleases first-class architects, and also my customers, who have had experience of the working of my style of doing things for a number of years back. In the circumstances of the failure of his uncalled-for attack upon Messrs. Craig and me, and the attack now by me for infringement of patent upon his makers, Mr. Bruce is hardly in the proper frame of mind—supposing he had the ability—to fairly criticise anything of mine at present. In the future I should not wonder although he consciously or unconsciously copies me still further yet, and so, whether intentionally or not, compliment me.—I am, &c.,

W. P. BUCHAN.

21, Renfrew-street, Glasgow, July 15.

P.S.—It may interest, and be useful to, your readers to show sketch of ground plan of ventilation of drains with air going same way as

the water. In this case, A shows the fresh-air inlet on ground, and which may have a self-acting valve-box below it to let air in but none out; C is the blow-off pipe carried up from the house-side of the trap; E is the blow-off from outer side of the trap for the sewer or main drain; if wished, E may be an air inlet; B is fresh-air inlet-pipe in wall, or carried up any desired height, and without or with self-acting inlet-valves or valve-box; D is the blow-off in connection with B for the drain W W; G is the manhole for disconnecting trap; F is disconnecting trap without a manhole, where trap not deep. It is unnecessary to refer to other details in this connection. W. P. B.

[This ends this matter.—ED. "B. N."]

PRICES OF MATERIALS AND LABOUR.

SIR,—I think there is a great need in the profession for an easily accessible and *reliable* list of current prices for the leading items both of materials and labour (including piecework rates). Of course, builders have these particulars at their fingers' ends, so to speak, and they can, with more or less difficulty, be ascertained by architects and surveyors; but it is inconvenient to have to do this just when one wants them for immediate reference, and for sundry reasons, well understood by merchants and others, the prices of materials quoted to professional men are not always reliable—*i.e.*, the real selling prices, though quoted as such; hence the difficulty in pricing quantities and checking builders' accounts with that accuracy and certainty which is to be desired.

I write to ask whether you do not think it would contribute to the still greater usefulness and success of the BUILDING NEWS if you were to publish such a list, either, say, weekly or monthly, as you would, no doubt, be able to obtain regular and reliable prices of both materials and labour, which would thus be always available for your readers.—I am, &c.,

July 18th. H. A.

[We have only recently pointed out why it is practically impossible for us to give such lists.—ED. "B. N."]

Intercommunication.

QUESTIONS.

[9346.]—**Green Timber.**—I will be glad to learn through your columns the number of cubic feet to a ton weight of green timber (or lately felled), oak, ash, beech, and elm.—GREEN.

[9347.]—**A Legal Question.**—A case has just occurred in which a builder has built a house by private contract and received the final certificate from the architect in due course when the house was completed now twelve months ago. The owner now asks the builder to pay for the certificate of the borough authorities, certifying the house is inhabitable. The builder having been kept waiting nine months for the balance of his contract and from other causes, considers he ought to be relieved of this, though they have no legal weight, but wishes to know if he can be compelled to pay. In the specification, where the only reference is made to it throughout the documents, it says, the contractor to give all notices and pay all fees; but does this fee come under the same heading the others do, and if it does, is it not the architect's place to ask for it before granting his final certificate? And if the architect does not ask for it, can the owner recover in this manner for his neglect? An answer from someone of experience in these legal matters would greatly oblige.—DOUBTFUL.

[9348.]—**Boundary Line.**—Can any practical surveyor give any information as to how to fix upon the correct boundary line of a field or plot of ground where no information is to be obtained from the title deeds? Does the centre of the hedge, where there is no ditch, form such boundary? If there is a ditch, is it the boundary? And where a field adjoins a public road, does the hedge belong to the owner of the field, and if so, how far may he come beyond the centre of the quicks? If anyone can give the title of any handbook that treats of all these matters he will much oblige—A YOUNG SURVEYOR.

[9349.]—**Concrete Floors.**—Will some of your readers kindly inform me of any tests showing the strength of concrete floors laid perfectly flat, and of equal thickness throughout, and supported on all four sides? I am anxious to ascertain the proper thickness to lay concrete—of course, properly mixed, and constituted, say, 6 to 1—under the conditions named, over voids up to 10ft. square to carry a closely-packed crowd.—KEW.

[9350.]—**Cheap Iron Roofs.**—Perhaps some of your readers can tell me of a publication giving examples of cheap kinds of iron roofs to roof a space of 40ft. by 80ft. without any intermediate supports. A work containing examples of the "graphic" method of calculating the various strains would be useful.—PERRY.

[9351.]—**Composition and Design.** — In the "Wayside Notes" of July 15th, in the last paragraph, mention is made of the "Laws of Good Composition," and the "Rules of Design." Will some reader give me the names of one or two reliable works on these subjects?—ONE ANXIOUS TO KNOW.

REPLIES.

[9331.]—**Mounting Photographs.**—I take the following from the first issue of the *Bookbinder*, W. Clowes and Sons, 13, Charing-cross, W.C., publishers:—"1. After trimming the print all round, moisten it slightly (the object being to have it limp, without stretching it), by placing it between sheets of damp paper over night, and it will be about right next morning. Damp the mount, also slightly, paste your print very carefully all over (using no more paste than is just necessary), lay it carefully on the mount, cover it with a piece of clean paper and rub it down well, and then place it in the standing-press between pieces of blotting-paper, and allow it to dry under pressure. It may be, perhaps, necessary to take it out of the press and change the blotting-paper. If all this be done properly, the photograph and its mount will lie quite flat. 2. Another plan is to paste the back of the print all over, allow it to dry; damp the mount, lay the print on the damp mount and pass them through the rolling machine, or place them in the standing-press under strong pressure. For this method we have to thank Mr. A. Cowen, a well-known photographer. 3. Take a piece of lithographic stone or a thick piece of glass; glue this all over with the gelatine, place the photographic print quickly down on the glued stone, rubbing it smartly all over, then pick it up and lay it down on the mount. All these actions must be rapid, and if done properly by this method, a photograph may be easily mounted even on thin paper without cockling. There are other methods, but with any one of these a binder may easily, cleanly, and properly mount a print of any size; the chief object being to get the print on to the board or mount before it has any time to stretch. As a final warning, see that the mounts are not boards made from wood pulp."—BOOKWORM.

[9345.]—**Sewage.**—A tank should be constructed at about 200 yards from the house, if convenient, made perfectly watertight, arched and covered over. A large manhole opening with iron plate cover should be formed in the arch for access to the tank, and a small hole for a pump should be formed in the arch. All the sewage from w.c.'s, grease-boxes, &c., should be discharged into the tank. The inlet-pipe should be a few inches above the overflow pipe. All the liquid overflow should be well filtered and purified before the water is discharged into a burn or exposed in any way. A small filter divided into two or three divisions can be constructed near the sewage tank at little cost. The liquid sewage, if pumped out of tank, will be found very useful for garden purposes, and the manure deposit should always be cleaned out before it reaches the level of the overflow pipe. The tank and filter should be well ventilated, and if situated among trees, a ventilation pipe can be fixed to a tree and carried up 18ft. or 24ft. A good disconnecting trap with deep seal, and well ventilated, should be placed on the sewage drain near the tank, and the drain from house should be well ventilated. If the rainwater is not stored for domestic use, a double system of drainage should be laid for the rainwater, as a large quantity of water should not be mixed up with the sewage in the tank, but arrangements should be made for the proper flushing of the sewage drains, in addition to good ventilation between the house and tank.—W. B.

[9339.]—**Alterations and Additions.**—I beg to thank "M. M." for his kind reply *re* above, and also to state that I have offered to do as suggested by him, and other fair and reasonable ways of disposing of the difficulty; but the owner refuses to entertain any of them. We have asked for arbitration, and offered to bear half costs, or to agree for costs to follow the event of decision. The work is to be seen, and speaks for itself; and moreover, we have actually expended a few pounds more than we claim, thus sacrificing our own time, railway-fares (as work was some distance from home), plans, specifications, &c. Any further advice would be fully appreciated.—A TWELVE YEARS' CONSTANT READER.

[9342.]—**Articles.**—The original indentures belong to the pupil, and must be given up to him at the expiration of his pupilage.—NORTH COUNTREE.

[9345.]—**Sewage.**—Cannot you lead the sewage to a place in the gardens convenient for use? Why not get all you can out of it?—NORTH COUNTREE.

CHIPS.

On Saturday last Mr. C. H. Hopwood, Q.C., of Liverpool, opened a new Liberal Club at Walsden. The building is on the main road from Rochdale to Todmorden, and is built of Yorkshire parpoints, with local stone dressings. The joiner's work is of pitchpine and white woods. The works have been carried out from the designs and under the superintendence of Mr. Jesse Horsfall, M.S.A., architect, Todmorden and Rochdale.

The sixth annual exhibition of the Norwich Art Circle, now open, is devoted to works of James Stark, one of the pupils of old Crome. Among the best pictures are the Duke of Sutherland's "Penning the Flock," a landscape with cattle, lent by Mr. George Holmes; "Road Scene with Ford," belonging to Mr. Harvard; and the Rev. H. H. Carlisle's "Sheep Washing—Morning."

A bust of the late Sir Harry Parkes, which has been placed in the crypt of St. Paul's Cathedral, was unveiled yesterday (Thursday) afternoon by Sir Rutherford Alcock.

The will of Mrs. Eliza Florence, late of 9, Prince's-gate, Hyde Park, who died on April 14th last, was proved on the 18th ult. by Henry Louis Florence and Ernest Badinius Florence, the sons and executors, the value of the personal estate amounting to upwards of £43,000. The testatrix makes special bequests to her two sons and her daughter, Ellen Eliza. The residue of her property she leaves to her three children, in equal shares.

A faculty having been obtained for the enlargement of St. Bartholomew's, Salford, by the deepening of the chancel, the carrying out of the work has been entrusted to Messrs. R. Neil and Sons, of Manchester. The total expenditure will be about £850. A stained glass window has been promised by the rector, the Rev. G. W. Petherick, in memory of his only son, recently drowned off the coast of Cornwall. The subject is Christ Blessing Little Children. The design has been furnished by Messrs. Holloway and Co., of Manchester.

Mr. John Bishop, of the firm of Barnard, Bishop and Barnards, ironfounders, of Norwich and Queen Victoria-street, E.C., died on Tuesday week at his residence in Norwich, aged 66 years.

The partnership between Messrs. W. and D. McGregor, of Acre Wharf, Belvedere-road, Lambeth, builders and contractors, has been dissolved.

The Ellesmere local board recently advertised for a surveyor, offering the munificent salary of £20 a-year! Five men offered their services; but the chairman said not one of them would be able to carry out the duties required under the Public Health Act, and he moved that the duties should be discharged by the Works Committee, who should meet once a month, and that a foreman of the labourers should attend to see what works were required, and report what work had been done, and receive orders for the ensuing month. This suggestion was adopted, and it was decided to give the fortunate foreman of labourers an increase of a shilling a week on his wages.

Princess Louise laid, on Monday, the foundation stone of St. Paul's Church, Vicarage-gate, Kensington. The new church, which is intended as a chapel of ease to St. Mary's, Kensington, will be built of brick in the Early English style, and will hold 1,000 persons. It is building from plans by Mr. Arthur Baker, of 14, Warwick-gardens, Kensington, whose design was selected in competition, and was illustrated by plan and exterior and interior perspectives in the BUILDING NEWS for the 11th of March last. The cost will be £10,000.

Our Office Table.

THE remains of Mr. Alexander Crawford, of Wyke Regis, Dorset, and formerly of Headingley, Leeds, were interred on Saturday in Headingley churchyard, he having died on the previous Wednesday. Mr. Crawford was, the *Leeds Mercury* remarks, by profession an architect, and a few years ago practised in Leeds. He was highly esteemed, and by few more than by his professional brethren, who admired his keen sense of honour and the strong desire he always evinced to uphold the highest standard of professional life. He was the second President of the Leeds and Yorkshire Architectural Society, and signalised his election to that office by an address of exceptionally beautiful diction. His practice was not large, owing to his retiring disposition; but he was a skilful designer, and always succeeded in gaining the high esteem of his clients. Mr. Crawford, who was 57 years of age, has left a wife and three daughters. Owing to the date of the funeral not having transpired until the day before, the architectural profession was only represented at the graveside by Mr. W. Hill, Mr. J. W. Connon, and Mr. G. F. Danby.

THE proposed setting back of the steps on the west front of the church of St. Martin's-in-the-Fields is giving rise to much correspondence. It seems that the Metropolitan Board of Works are acting in the matter on their own responsibility, and so far have not submitted any plan or scheme for the approval of the First Commissioner of Works. Mr. W. Butterfield mentions the interesting fact that the parish of St. Martin's possesses a beautifully-executed model of the present church, which dates back to the time of its building, and must have been made under the direction of the architect, Gibbs. After examining this model, Mr. Butterfield's scruples in recommending a setting back of the portico to half its present space are much lessened, as it shows a portico of the size to which he has suggested the existing noble one will have to be reduced if the far greater injury which the Metropolitan Board of Works proposes is to be averted. Mr. Ralph Nevill, F.R.I.B.A., suggests that the street could be widened without interfering with the church, as all that is required is to take down the flight of steps leading to the disused door of the former residence of the keeper of the National Gallery, and to carry the pavement over the useless area adjoining. The railings to the front area would start from the corner of the building. By this means a 40ft. road would be obtained, he says, at very small expense, and without damage to any architectural feature of either building.

MESSRS. DOULTON are exhibiting at their establishment, on the Albert Embankment, Lambeth, a reredos and font, executed for the Prince and Princess of Wales, for the English Church at Copenhagen. They are from a design by Mr. A. W. Blomfield, the architect of the church, and consist of terracotta with Doulton ware columns, and panels by Mr. George Tinworth. In the reredos are represented three subjects; on the sides "The Betrayal of Christ" and "The Unbelief of Thomas," and in the centre "The Ascension of Christ." On the front are illustrations of "The Finding of Moses," "Samuel and Eli," "The Infant Saviour in the Manger," and "Christ blessing Little Children," placed alternately with panels, from which they are divided by small columns of Doulton ware. The basin is a fine specimen of the same ware. These works will be on view until the end of the next week.

THE National Footpath Preservation Society have issued their second annual report, which proves afresh the truth of the adage that prevention is better than cure, at any rate in all matters of threatened encroachment on public rights. The Duke of Westminster is patron, and the Earl of Bective president; it has also a good array of distinguished names in the list of vice-presidents. The report is full of local records of all kinds relating to footpath preservation, full of suggestions and illustrations in connection with pathways, whether by land or by water. By carefully investigating alleged rights-of-way disputes, the association is often in a position to prevent money being wasted in unnecessary litigation. The number of members during the past year has nearly doubled. The secretary is Mr. Henry Allnutt, 42, Essex-street, Strand, W.C. The society has lately assisted the inhabitants of St. Ishmael's, near Milford Haven (South Wales), in an action at law, in which they successfully defended their rights of way to the sea-shore. A report of this case is also published by this useful society, which deserves to be yet more widely supported. The annual meeting of the Birmingham Association, which has similar objects as the National Society, was held in the town on Friday, Mr. R. Chamberlain, M.P., in the chair, when an encouraging report was read by the secretary, Mr. T. Grosvenor Lee, which showed that a large amount of good was being done at a very small cost, either of money or illfeeling.

THE city council of Manchester received and considered on Thursday, the 14th inst., a joint memorial received from the Manchester and Salford Sanitary Association and the Manchester Society of Architects urging the necessity of the codification and amendment of the building by-laws in accordance with modern requirements and the most approved sanitary principles. Alderman Heywood, who proposed that the memorial be referred to the Paving and Sewering Committee, explained that the City surveyor had been engaged for some time past in the preparation of a new code of by-laws, based upon the code which had been adopted by the Local Government Board. Several members of the corporation having pointed out that a clear and effective code of by-laws was demanded alike by conservators of public health and the equitable treatment of architects, builders, and property owners, the motion was agreed to.

THE summer meeting of the Institute of Mechanical Engineers will be held in Edinburgh on Tuesday week, August 2, and the three following days. Among the papers to be read are the following:—"On the Structure and Progress of the Forth Bridge," by Mr. E. M. Wood, of London; "The Machinery Employed at the Forth Bridge Works," by Mr. William Arrol, of Glasgow; "The Electric Light on the Isle of May," by Mr. David A. Stevenson, of Edinburgh; "The New Tay Viaduct," by Mr. Fletcher F. S. Kelsey, resident engineer; "The Dredging of the Lower Estuary of the Clyde," by Mr. Charles A. Stevenson, of Edinburgh; and "The Position and Prospects of Electricity as applied to Engineering," by Mr. William Geipel, of Edinburgh. Excursions will take place to the Forth Bridge Works. The Carron Iron Co.'s Works at Falkirk, the new Tay viaduct, the Edinburgh Water Works, the Electric Lighthouse on the Isle of May, the Exhibition at Newcastle-on-Tyne, and other places of interest. The President, Council, and members of the Institution will be received in the University Library Hall on Tuesday, August 2, by the Marquis of Tweeddale, the Lord Provost, the Chancellor of the University, and other dignitaries. The reading and discussion of the papers will take place in the Natural History Lecture Theatre. On the Tuesday the Institution dinner will be given in the Masonic Hall; and on the Wednesday there will be a conversazione in the Science and Art Museum and a lecture by Sir Wm. Thomson.

A COMMITTEE of the Town Council of Birmingham have recently acquired two fine suits of Persian armour, which are now exhibited in the Industrial Hall of the Art Gallery. Each suit comprises a shirt of mail, a helmet, a shield for the left arm, a brassard or guard for the right arm, and a battle-axe. The larger set consists of a shirt of chain-mail which weighs no less than 26½lb.; all the links, some thousands in number, are riveted, and are hand wrought. The helmet, which is hemispherical, and surmounted by a long spike, is inlaid or damascened with gold, and is also ornamented with medallions of household and hunting scenes, chiselled in low relief. Round the lower portion of the helmet runs an inscription in a debased form of the old Cufic writing. In front of the helmet is a nose guard and two small sockets in which were placed peacock or other feathers. At the back is a small curtain of chain armour for the purpose of protecting the back and shoulders of the wearer. The shield is circular, of chiselled iron, damascened in gold, and decorated with four projecting bosses, in appearance very similar to Kuftgain work; in the centre is a Cufic inscription, and the border is surrounded by the same, forming a band about 6in. in width. The surface of the shield is covered with drinking scenes, and with small figures of antelopes, panthers, and other animals. The arm-guard is similar in character to the shield and helmet. The battle-axe is of fine steel, and near the shank of the axe the steel is chiselled and enriched with gold, two figures of rabbits being worked into a required space with great ingenuity. The other suit of armour is entirely different in design, and has an inscription in silver.

PARLIAMENTARY NOTES.

THE METROPOLITAN BOARD OF WORKS.—Mr. O. Morgan asked the Home Secretary whether his attention had been called to the reports in the public press of a discussion at the Metropolitan Board of Works on Friday with reference to certain charges made against an official of the architect's department; and whether he could promise that a full inquiry would be made.—The Home Secretary replied that he had seen a report of the proceedings. He was informed that the Metropolitan Board of Works had, through a committee, made a full inquiry, and the report which had been presented was the result of that inquiry. He disclaimed the position of representative of the Metropolitan Board of Works.

LEGAL INTELLIGENCE.

WOOD'S PATENT MORTISE CHISELS.—In an action of John Wood and Co. v. Thomas Robinson and Son (Limited), Mr. Justice North, on the 14th May, by consent, perpetually restrained the defendants from selling, or offering for sale, as Wood's patent mortise chisel, any mortise chisels other than such as are manufactured or sold by John Wood and Co., and ordered the defendants to pay all the costs and expenses incurred. It is as well to note that proceedings will be taken against all persons manufacturing or selling chisels as Wood's patent chisels which are not manufactured by John Wood and Co.

STAINED GLASS.

WARNHAM CHURCH, SUSSEX.—This church, lately restored by Mr. A. W. Blomfield, has just received the addition of three stained-glass windows—one a Jubilee gift of the parishioners, the others the gift of Mr. W. H. Maudesly and his son. The figures in Jubilee window represent the Queen of Sheba and Queen Esther, with suitable inscriptions. These windows were designed and executed by Messrs. Heaton, Butler, and Bayne, of Garrick-street, London, who executed all the other windows at consecration, as well as the painted panels and reredos.

CHIPS.

Mr. Arnold Taylor, Inspector for the Local Government Board, held an inquiry at Accrington, on Friday, in response to an application to borrow £26,000 for works of private street improvement, and a similar sum for sewerage works, &c. It was stated that when the streets proposed were completed Accrington would be one of the best paved towns in Lancashire.

Mr. Percy Gardner, M.A., F.S.A., of the British Museum, Disney Professor of Archæology and late Fellow of Christ's College in the University of Cambridge, has been elected to the Professorship of Classical Archæology, recently founded by Merton and Lincoln Colleges, Oxford.

The foundation stone of St. Augustine's Church, Monsall, Manchester, was laid on Saturday. The dimensions externally will be 106ft. by 50ft. (exclusive of transepts), and the style of architecture chosen is Late Gothic. There will be accommodation for 500 persons. The roof is one span of 44ft. The total cost will be about £3,800. Mr. A. W. Smith, 17, St. Ann-street, Manchester, is the architect.

The memorial stone of a new church school was laid at Cheriton, near Folkestone, on Thursday, the 14th inst. Mr. Matthews, of Folkestone, is the contractor.

Mr. G. F. Watts desires it to be understood that his gallery of paintings at Little Holland House, Melbury-road, Kensington, is open to all who choose to apply for admission on Sunday afternoons from 2 till 6 o'clock, without any introduction, card, or restriction.

The Marquis of Hartington opened on Wednesday the new building in connection with the Railway Servants' Orphanage, Derby. It has cost £10,000, and accommodates 300 children.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1699.

FRIDAY, JULY 29, 1887.

CONVENTIONAL SPECIFICATIONS.

SPECIFICATION-WRITING, like legal draftsmanship, has rather obscured than made clear the duties of those who are entrusted to carry out the intention of the author. In both of these forms of professional prescriptions, the verbiage is by no means any gauge of the comprehensiveness or clearness of the draftsman; sometimes, indeed, the greater the verbosity the more doubtful is the meaning conveyed. Nor is curtness of phrase always a sign of clearness and intelligibility. It often is a substitute for knowledge and precision. Such a clause as "All the materials to be of the *best* quality and approved by the architect" conveys very little information. The word may mean "best" of a certain kind; it may imply best of the kind generally used by the architect, not necessarily the best quality that can be procured or best for its application. These adjectives, however, embody in any easy uncompromising sort of way what is nevertheless to be inferred, without committing the writer to any statement that would expose his ignorance of materials. We must go back to the beginning of the system of contracts to discover any reason for the present laxity of specification clauses. As the main idea of the contract system was to cheapen and expedite building operations by competition, it was not unreasonable to conclude that those who drew up specifications were anxious not to appear to be too particular or exacting in their wants, and, therefore, were induced to use general phrases that could be interpreted by the builder of an "elastic" conscience in his own way. It is not at all unlikely that some of the vague clauses found in specifications are derived from the descriptive agreements of tradesmen who have supplied materials and workmanship, and who were careful not to bind themselves to any exacting terms. To one or all those causes we must attribute the formal and ambiguous provisions of the modern specification. There are reasons, and strong ones, for not particularising too much. Definite prescription requires an extensive knowledge of materials, trade marks, and the methods of workmanship, a degree of attainment that can only be expected from knowledge and practical experience. A young architect would, for example, be safer to describe the stone to be used "to be of the best quality, free from all vents, shakes, and other imperfections," than if he were to describe a particular quarry without knowing the different beds and qualities, which would tie him to the acceptance of perhaps an inferior stone. So with regard to timber. The customary clause is that the timber is to be from the Baltic, or "to be of the best Dantzic, Riga, or Memel yellow fir," though there are few architects who obtain the best from either of these ports. A more experienced architect who knew something of the timber trade would be contented if he could be sure of getting medium quality Memel or Dantzic, from some well-known shipper. Much reliance cannot be placed upon Russian market brands in timber and deals, though it is upon these that the architect mainly rests when writing his specification for carpenters' work. Reputed brands often turn out to be misleading. A favourite clause is that "no Swedish timber is to be used," though it is worth notice that "mixed" quality Swedish red or yellow deals are often better than so-called first quality Baltic. The specification phrase—"the best timber"—means in the timber merchant's vernacular, straight-grained timber, free from knots. Probably there is more room for evading the intention of the architect in this part of the specification than in any other; so many characteristics go to make up good timber—the mode of growth, time of felling, nature of the soil—all of which are unknown to the architect. Mr. Hurst very judiciously observes, speaking of pine-wood, "Much confusion has arisen among architects and builders owing to the absurd practice of naming this timber after the ports of shipment, and also from confounding the pines (*Pinus*) with the firs (*Abies*), although they belong to distinct genera." The *P. sylvestris* is commonly known as "red" or "yellow" fir. The tree grows in Scotland, in the Baltic, and Russia. The late Mr. Thomas Laslett, a high authority on timber, places in a general way the order of quality for deals and battens as follows: First, Prussia, then Russia, Sweden, and Finland; last, Norway. It has been noted by Col. Seddon, R.E., that some of "the very best Baltic deal, both yellow and white, comes from Gefle and Soderham." By white deal, of course is meant the deals cut from the spruce (*Abies*). We hear it generally specified that all floors and joiner's work are to be of the "best Christiania deals," though it is generally known to all importers that these deals have lost the high reputation they once had, while it is incontestable that Swedish deals can be obtained that are sounder and more uniform in quality than the Russian deals. One reason for the difference is the mode of conversion. Col. Seddon, in his useful remarks on timber, observes: "A balk of Russian timber is all cut into deals of one quality; hence the numerous hearts or centres seen amongst them, which are so liable to shake and split; whereas in Swedish timber the inner and the outer wood are converted into different qualities of deal; hence the value of first-class Swedish goods." Taking, therefore, the admitted scarcity of good Christiania and Norwegian yellow deals, and the unequal qualities of those from Russian ports, it is safer for architects to specify goods which there is more chance of obtaining of good quality, such as the yellow deal from Gefle and Soderham. As we have said, "brands" are unreliable unless they are selected with knowledge: "second" quality deals of one shipper are well-known to be equal to another shipper's "first" quality. Some experience and art are required to find out the best shippers and their trade marks—a kind of special knowledge that will repay the trouble of acquiring, if one desires to avoid many of the equivocal phrases in specifications.

To avoid stereotyped phraseology, the result of copying one specification from another, the profession may do something. At present the tendency is to repeat a good general form *ad infinitum*. Specialisation is avoided as being inconvenient, and local peculiarities of material and workmanship are not favoured by the writer. On the contrary, the clauses are dictated by a knowledge of the materials of a very general and often imperfect nature. It is the information that has been picked up in the office during apprenticeship; acquired not from contact with quarrymen, brickmakers, timber importers, and workmen engaged in building, but more from office traditions. Once a general form has been adopted, it is transmitted to future generations. A special form for each new building would be exceedingly laborious and inconvenient, and to some extent certainly unnecessary. But clauses are repeated so often that they lose their original significance and force. Contractors get to look contemptuously upon an official jargon that they know has been applied to hundreds of very dissimilar cases. We may give a few illustrations. The conventional specification reads: "The mortar is to be compounded of stone lime and sharp, clean sand, mixed together in the proportions of one of lime to two of sand." The contractor takes little notice of the formula. The proportion is not attended to, there is no test specified, and the lime may be anything but fresh. Then, "sharp, clean sand"—how often we find sea sand instead of clean pit sand. The clause has been interpreted in such a manner as to disarm criticism; the germs of mischief appear on the wall, but nothing can be done to rectify the mistake. Again, as to the concrete or Portland cement, the ordinary clause is based on imperfect data. High tensile strength is generally made a condition, whereas the more practical test is the adhesive strength. It is well understood that the tensile test depends on several circumstances—the atmosphere, the mode of manipulation, temperature of water, &c., and may therefore be very misleading. Air slaking is a very important condition, but seldom insisted upon. Specifications lay down certain conditions, such as weight, fineness, strength, and time of setting. One writer on the subject refers to the marked differences, except in time, amounting in some cases to positively absurd proportions—as much as 300 per cent. in the requirement as to fineness, 18 per cent. as to weight, and over 100 per cent. as to strength. Too high a tensile strength may be purchased very dearly: the cement may be over-limed, which gives a high result at seven days, but is found to lead to expansion and cracking of the concrete mass. A tensile strength of 350lb. per square inch at seven days increasing with the age is preferable. Mr. Mann suggests the following specification for adhesive strength: "The Portland cement shall be ground so that no more than 45 per cent. shall be stopped by a No. 176 silk sieve, and its adhesive strength after 28 days' immersion shall be 95lb. per square inch; cement, as supplied for use, not less than 75lb. per square inch. Six tests being employed in each case." The No. 176 silk sieve gives 30,976 meshes per square inch.

Another stereotyped clause prescribes the drains; so many feet of stoneware pipes of a certain diameter are specified, and the mode of jointing; little is said about the bottoms of trenches, nothing about ramming them, about gradients, about avoiding curves and sudden drops, the cleaning out of the pipes as they are laid, and other precautionary measures, such as testing. We have no space to go through all the trades and suggest improvements and point out omissions. What we complain of are the uncertainties and inexact descriptions of many matters which are left to the good sense and knowledge and honesty of the contractor. To take one or two trades which appear to be very superficially dealt with. The "Founder and Smith" is one of these. A great deal is left to the founder and engineer. The iron joists that are provided are often of Belgian manufacture, and need careful specification and testing. Details like bolts and nuts and threads are left to the maker. We have seen bolts and nuts in roof trusses that do not take any strain, or very little, and have probably never been screwed up. To pass to general ironmongery, the same generalities suffice. Contractors repeatedly fix door-locks of very inferior description because the specification is inexplicit about the kind of lock intended, instead of specifying "Chubb's" or "Hill's" or "Kaye's" locks, or others of approved make. Wrought butts are often specified, but how often we find cast used. It is important also to name the grates and the manufacturers' names, to avoid the substitution of inferior make. The hot-water supply is one of the many special provisions that are left to the contractor or engineer owing to the imperfect or superficial knowledge of the writer. General directions can only be given, but these should be more intelligible than the phrase,

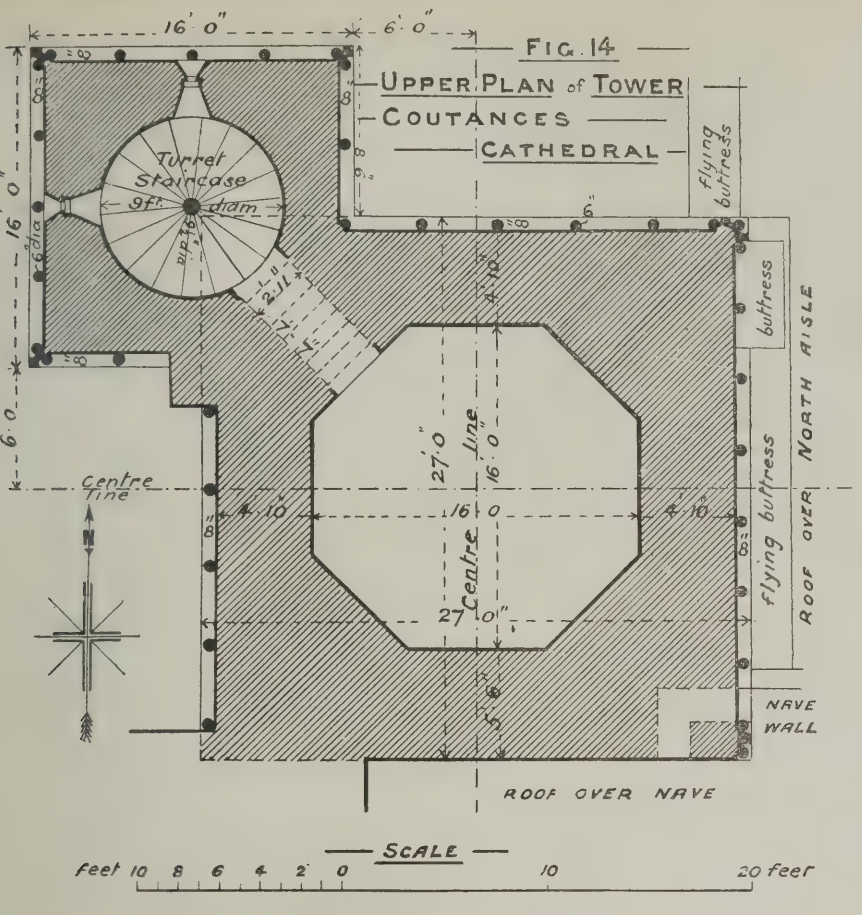
"To provide and fix to the architect's satisfaction a hot-water apparatus, &c., &c." At least the position of pipes, the kind of boiler, tank, or cylinder ought to be specified. The circulating pipes should be directed to be placed in positions that will avoid the inconveniences of contact with soil or waste pipes. They should be carried up in inner walls, never in outer, if possible, so that frost and cold should not affect them. The pipes should be placed in channels, the two sets of flow and return should be separated, and the hot pipes cased or packed with felt wherever necessary. A clause of no uncertain meaning should make it prohibitory to run pipes in new brickwork and to cover them up with plaster. Many disappointments arise from carelessness in arranging the pipes; long draw-off services are introduced, in which the water gets cold, and heat is wasted, the flow pipe is taken from the boiler horizontally and the circulation is retarded, "dips" in the flow pipes are made, and imperfect connection with boiler. There are a score of other technicalities which ought to be mastered before a competent or sufficient specification of a heating system is written. If our space allowed we could extend these remarks to other trades in building. Our recommendations are simply that the different tradesmen and manufacturers should, for their own protection, and to prevent incompetent men from entering into competition, join with the profession in formulating a series of general clauses that may be safely introduced in specifications for the various trades.

ALTERATIONS AND EXTRAS.

THE inattention of builders to forms is common in some parts of the country. Estimates are given for performing sundry works, and are accepted without any written form or agreement binding on both parties. The result of this kind of transaction is never satisfactory; in most cases disagreements ensue, and each party thinks he has a good case. Strange to say, a large number of works in the country are undertaken in this manner. An architect is not engaged. The building owner is desirous of building or making some alterations; he calls in a builder, who gives him an estimate for doing the work according to a roughly-drawn plan and elevation; it is accepted, and forthwith the builder, on no other agreement than a formal acceptance, commences the work. It is not long before alterations or additions suggest themselves to the owner, which would perhaps have never been required had properly prepared plans and drawings been made at the commencement, and the builder is required to send in estimates for these, or to contract for them. These alterations are frequently so mixed up with the original contract work that it becomes hard to say what was intended under the first contract, and things get into such a hopeless confusion that often the builder himself does not know what he is really entitled to. The works are at last completed, and the builder makes out his account for alterations and extras. The owner refuses to pay. Who is to be the arbitrator? One of our subscribers recounts in our Intercommunication columns a very similar transaction. The owner declines to pay on the ground, so often assumed, that the additions claimed for were understood to be included in the original tender. There is no satisfactory basis upon which any definite contract can be founded except the plan, specification, and quantities which have been prepared by the builder himself.

As most of our readers are aware, the acceptance of a tender constitutes in law a contract, and binds both parties to a performance. Unless, however, the terms of the tender are very plain, or the plans are clear and prepared with skill, it is very easy to understand how very unsatisfactory a contract of this nature becomes. The builder, if he tenders on the plans and specification, is supposed to have brought sufficient care and skill to the task; but the person who accepts the tender does not enter into any implied warranty of the correctness of the plans, even if they have been prepared by an architect. The builder is supposed to have examined them carefully, and based his tender upon them, for he will be bound by the contract. In "Thorn v. Mayor of London," a contract was entered into to take down a bridge and rebuild it. The descriptions given in the plans and specification prepared by the engineer were stated to be "believed to be correct," but were not guaranteed. The contractor claimed compensation for additional labour. It was held by the Court there was no express warranty. In like manner, if a builder or architect finds his plans imperfect, and to amend or rectify them it is necessary to add to the cost, he cannot reasonably expect the owner to pay for the extras so incurred. A builder under these circumstances often hails fresh orders as one of the means of invalidating the original contract. But a detailed account for additions and extras might be a formidable affair for the owner if he expected that any orders he had given were only those necessary to make the building fairly perfect. Owners and builders have only themselves to blame for proceeding on these uncertain data. Additions are made, and prices given and accepted in writing upon the *ipse dixit* of one of the contracting parties, without in some cases allowances being made for materials and labour under the first contract. Thus, if a room has to be made larger than the plan shows, the additional cost ought to be calculated, making a proper allowance for the end wall, which would remain as shown. The owner probably pays 50 per cent. more than the value when the detailed account is presented. On the other side, works are executed or ordered that have not been agreed for as to price; the owner refuses to pay for them, alleging that he understood they were included. They may not have been shown or described in the plans or specification. Can they be charged for? A little reflection will show that there is a reasonable implication that they are included in the contract in the absence of a written agreement or order. Any Court of law would draw such a conclusion. It is a well-known principle that if a builder undertake to do work according to a specification and deviate from it without special orders, he cannot recover; by the same reasoning, if he does extra work, he is unable to claim for it unless he can show written orders. Notwithstanding these facts and decisions of legal authorities, builders are found who daily set them at defiance by entering into contracts to perform works upon the most imperfect understanding. They prepare plans and estimates, and when the building is finished they imagine that the owner is ready to accept all that they have done for them, and to pay these accounts without the slightest hesitation. The owner is equally to blame for entering into a contract to pay a certain sum for something he does not understand, estimated by the other party on his own plans. The individuals may be perfectly honest in their intentions, yet the conclusion to be drawn from these contracts is the same—the want of assurance that the work will be performed in a satisfactory manner without the intervention of an architect. It is difficult to advise a mode of settlement between builder and owner who fall out at the end of their engagement. Probably the best plan, and the most impartial, is to call in an arbitrator in the manner suggested by one of our correspondents, who would value the several works and additions ordered, the owner paying the fees if the amount should exceed the sum claimed, or *vice versâ*. Architects have probably to thank themselves for making it possible that building owners prefer to do without them in small undertakings. There are two reasons for this avoidance of the architect's services. One is the fear that the architect will design a too costly building; the other, the saving of a commission. With regard to the first, the owner of small capital who knows exactly what he wants has, we fear, some ground for his preference; though with respect to the latter, we doubt very much whether the sum spent on "extras" to make the building perfect, and the expenses of the builder to obtain payment, do not considerably overbalance the customary fees.

THE STABILITY OF STONE SPIRES AND TOWERS.—IV.

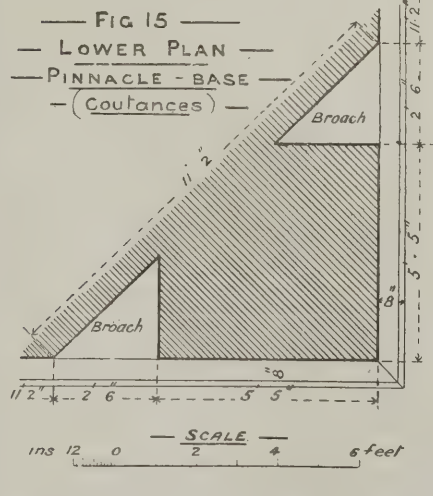


(*Continued from page* 789, *Vol. LII.*)

TOWERS.

IN many instances the stability of these structures is so far beyond all doubt as to render any calculations unnecessary, and it appears that as long as such structures are designed by architects as works of fine art, and as long as the designers endeavour to "make books of their churches," the problems will never be reduced to the same studious methods of economy by which modern engineers ascertain the least amount of material which is required to resist a definite amount of stress. For instance, the stability of a tall chimney shaft is easily determined by the simple ratio of weight *v.* wind-pressure; but many of our modern architects insist upon building many tons of solid masonry into the walls of their towers which an engineer would leave in the quarry after five minutes' consideration; and the engineer is right if these structures are merely required to resist storm and tempest in the work of raising a belfry or a clock tower above the surrounding objects. The difficulty of determining the amount of solidity which is alone sufficient to insure permanent stability under modern requirements is produced by the fanciful sentiments of art criticism or the indefinite dictation of artistic designers.

One authority (John Ruskin) writes thus:—"Your noble tower must need no help, must be sustained by no crutches, must give place to no suspicion of decrepitude. Its office must be to withstand war, look forth for tidings, or to point to heaven; but it must have in its own walls strength to do this. It is to be in itself a bulwark, not to be sustained by other bulwarks; to rise and look forth, like the tower of Lebanon that looketh towards Damascus, like a stern sentinel, not like a child held up in its nurse's arms." Bearing this in mind, and returning for a moment to the illustrations of the tower at the Cathedral of Coutances,* it will be seen that the walls are at least 5ft. thick below the belfry floor, and that the proportionate height, measured half way up the spire from the floor of the nave, is only about seven times the outside diameter of the base, the dimensions by scale being about 27ft. by 187ft. = 5,049sq.ft. area, exposed to a pressure of 50lb. per square foot, and producing an applied force of about 113 tons, with a leverage of half the height, 93ft. 6in., the result being a moment of 10,565ft.-tons. To resist this force, the total amount of stonework in the whole structure may be roughly estimated at almost 70,000 cubic feet, or a weight of about 4,375 tons, if the material is assumed to be 16 cubic feet to a ton, so that a leverage of 2ft. 5in. would produce a moment of resistance of 10,573ft.-tons. But the mean diameter of the base is about 21ft.; and the nominal limit of the deviation of the centre of pressure from the centre of the base was recommended by the late Professor Rankine to be not less than *one-third*, or about 7ft. in this case, the ground plan being a hollow square; and it is therefore evident that the principal purpose of the wind-pressure calculations is to ascertain the variation produced in the compression stresses on the base. The sectional area on the plan at the level of the nave floor is about 500sq. ft., so that the mean pressure is 8¾ tons per square foot, and the variation of the extreme pressure on the leeward edge of the base from the mean is



* BUILDING NEWS, 1st and 15th November, 1878.

$(8\frac{3}{4} \times 2\frac{5}{12}) \div 7 = 3{\cdot}02$ tons per square foot. The extreme pressures are therefore $11\frac{3}{4}$ and $5\frac{3}{4}$ tons per square foot; but any building stone which could be described as good enough for important work of this nature would safely bear 15 tons per foot, and the difference between these figures represents a proportionate excess of material.

There need not be any hesitation in stating that this tower contains at least *a thousand tons* of solid masonry that might have been left in the quarry, if it were merely designed to resist the forces mentioned; but before it is condemned for extravagance of material, its [illegible] reminds us that it was probably built [illegible] in turbulent times, or, as previously quoted, "to withstand war," and perhaps earthquakes as well. There is, however, no similar excuse for modern British architects, for almost all of their structures are erected outside of the area of seismic convulsions, and the task of building bomb-proof casemates or bastion flanks may well be intrusted to our military engineers.

If it is assumed that the weight of a tower similar in elevation to the Coutances model could be reduced to 3,000 tons, and erected on a base to be 27ft. square on the outside lines, the thickness of the walls at the level of the nave floor may still be 6ft., because the reduction in the weight may be obtained by gradually diminishing the thickness upwards, as an engineer would design a chimney shaft, or, as in other cases, where window openings are cut out of the sides. The mean diameter being 21ft., the area of the base is $4 \times 21\text{ft.} \times 6\text{ft.} = 504\text{sq.ft.}$, from which a deduction of about 75sq.ft. may be assumed to represent archway openings from the nave or aisle, leaving an area of 429sq.ft. for a pressure of 3,000 tons, or a mean stress of 7 tons per square foot. The moment of the applied force being, as before, 10,565ft.-tons, requires a leverage of $10{,}565 \div 3{,}000$ tons $= 3\frac{1}{2}$ft., exactly half of the nominal limit of deviation, so that the variation of the extreme pressures from the mean is only $3\frac{1}{2}$ tons per square foot, making the greater extreme $10\frac{1}{2}$ tons per square foot. This result shows a saving 1,375 tons of masonry, and a decrease in the extreme stress on the leeward side of the base, which is sufficient to explain that the mere fact of the requirement of the Ecclesiastical Commissioners or the Incorporated Church Building Society—which directs that walls more than 30ft. in height must be not less than 3ft. thick—does not involve an excessive amount of stonework; because it has been shown on page 788 that the walls of the belfry of Coutances are 5ft. thick, and still there is not one ton too much, because each of the eight sides of the tower, shown on Fig. 12, is reduced from a sectional area of about $43\frac{1}{2}$sq.ft. to about $13\frac{1}{2}$sq.ft. by cutting out eight lantern windows, shown on Fig. 10, each measuring about 30sq.ft. on the plan, and about 16ft. in height. This is

what is termed "bold and daring construction," the least quantity of material to resist a given stress, in a manner which our modern engineers would find a most difficult task to surpass with similar materials, and one other condition not yet referred to, that it is a work of fine art.

But there are more practical lessons to be derived from the same example. It should be observed that the height of the tower for stability considerations was measured from the floor of the nave and aisle, in accordance with Ruskin's theory previously quoted, that the tower should be strong enough to stand alone; although it will be seen from Fig. 14 that the south side of the tower is attached to the north wall of the nave, which is 67ft. in height, and the north side of the tower is greatly strengthened by a flanking tower containing a stone turret staircase. The second method of treating such a combination would be to neglect the wind pressure on the tower below the top of the nave wall, and take this level as the datum from which the calculations should be made, though even in this process the tower should be treated as though the base were symmetrical, because as the north side of the tower is much stronger than the south side, the result would give the stresses on the weaker side in exactly the same manner, as the fact that the strength of a chain is not only determined by its weakest link, but by the weaker side of that link.

Architectural critics have frequently denounced the deceptive use of members which should have, or profess to have, a structural duty, and have none. It is, therefore, satisfactory to find that the angles of the tower of Coutances have not been ornamented with idle buttresses, for a very slight examination is sufficient to prove that it "needs no more buttressing than a basket does," as John Ruskin wrote of the tower of St. Ouen at Rouen; although it must be admitted that the pinnacles on the angles "have no work to do whatever, but stand round the central tower like four idle servants, as they are."* They stand on solid square bases which fill up the angles of the square tower, cut off by forming the upper part as an octagon, as shown on Fig. 15, and each base being 21ft. 3in. in height, up to the cut line on Fig. 9, contains about 750c.ft. The upper portion, shown on Fig. 10, is composed of four solid shafts moulded, three of which are 290sq.in. sectional area, and one 330sq.in.; and four solid mullions, each 72sq.in., making a total of $10\frac{1}{3}$sq.ft.; the height being 45ft. 9in. to the top of the caps, it amounts to 474c.ft. Above this there is a hollow spire, 6ft. square by 18ft. high, resting on a square base, and containing about 236c.ft. The total amount of stonework is $236 + 474 + 750 = 1{,}460$c.ft., at $1\frac{1}{4}$cwt. per foot produces a weight of 92 tons at each angle of the tower. If this tower had been designed by strictly economical methods for modern purposes, an item of 368 tons of masonry would form an essential part of its stability; but in the present case, the structural utility of these pinnacles, as an addition to the stability of the tower, is not of much importance when there is such a large amount of useless material; although it should also be stated that about 280c.ft., or $17\frac{1}{2}$ tons, of the pinnacles was included in the weight of the spire, which proved to be a welcome addition when the results of the stresses on the lantern window piers were ascertained.

(To be continued.)

"BUILDING NEWS" DESIGNING CLUB.

SUBJECT P.—A VILLAGE PUBLIC-HOUSE.

SOME of the most interesting of the few unrestored old village buildings still left to us in England are to be found among the wayside taverns and country hostelries scattered here and there about the kingdom, while some of these, although now only the remnants perhaps of much larger buildings, are notable specimens of our national domestic architecture. The "Feathers" at Ludlow, "The George" at Norton St. Philip, Wilts, or the "Glastonbury Arms" at Glastonbury, for instance, may be mentioned. Everyone knows the vulgar and "gew-gaw" style of work usually adopted for the regulation modern "pub.," and many a quaint old village street has been spoiled by the obtrusive and incongruous "brewer's house" with its glare and glitter, with its characterless front, and striking want of hospitable capacity. The subject itself is eminently adapted to a picturesque treatment, and there are, as already noted, some good old models to study as examples. We have received several highly creditable designs, as might fairly be expected from such workers as the members of our Designing Club have proved themselves to be; but we cannot avoid the remark that not one really quite hits off the ideal arrangement and design of such a house. "Loidis" sends, of course, a good design, though we cannot award his this time the first

* "Seven Lamps of Architecture."

place, because his plan has one or two radical faults in it, and because his external treatment is somewhat too ambitious; otherwise there can be no doubt about the general "go" and good detail of his composition, which merits warm praise at our hands. "Norseman," with less effort, gives, as we think, a more suitable design, and thus wins the post of honour. Not that we deem his plan perfect; indeed, at a glance the difficulty of serving the tap-room is noted as a conspicuous want, and the position of the fireplace in the bar is most inconvenient. The bar itself, too, is hardly a comfortable place for refreshments irrespective of the chimney corner, and the parlour for honoured guests is not reached quite in the best way, neither is it large enough. The kitchen and private sitting-room are well isolated, and the back premises of the house are privately placed. The door to the larder next the back entrance would be an uncommonly convenient arrangement for tramps. A transposition of the scullery would have obviated this. The bedrooms are well contrived, but that over the archway should have had a fireplace, and a w.c. ought to have been placed on this floor, and without any difficulty these points could be managed. Externally the treatment is plain and suitable in general terms, and with some little revision would work out well in execution. The bar in "Loidis's" plan (which is awarded the second place) is much too small; the standing space for visitors occupies all the hall of the house, the staircase, too, being in the way of their comfort, and the bar parlour is cut off too much from the bar, the only service being by way of the standing room of the customers who prefer to remain at the bar. The wine-cellar stairs are too near the side entrance door, which must be used by the service to the tap-room on the other side of the archway. The bar-parlour in itself is a very comfortable room nicely planned, if not a trifle too large. The kitchen door should not face the front door, and the w.c. out of the hall is hardly a decent arrangement in such a building. The tap-room is a rather sumptuous apartment for country yokels, but looks very comfortable. The rest of the plan speaks for itself, and the bedrooms are convenient. The room on the first floor at the corner with the bay tower is good enough for a sitting-room. We have already remarked on the architecture of this design. Both plans are herewith illustrated. "Clair" takes the third position, and would have scored higher had his drawings been better. His perspective view is very poor, and does not do his elevation justice, which is a pity. The bar in this plan is much more suitable: it serves the bar parlour, has a good standing space in the front, and has a door for the potman to obtain the execution of the taproom orders. The house is cleverly rendered private; but the staircase hall would be dark, and the scullery should not open out of it. A side entrance for the use of the house was intended, opening out on the return road frontage. "Northumberland" has done this, and he gives a good regulation bar and little parlour adjoining. The taproom service is poorly contrived; indeed, it has been almost forgotten. His drawings show great merit; but the elevation lacks character. "Gereon" displays considerable originality and thought in his plan; the bar arrangement is excellent. Not so the taproom, which opens out of the street. The small bar, as a recess in the wall is called, would be quite useless. The offices to the house are unduly restricted, but the bedrooms look conveniently placed. The birds'-eye perspective shows an extensive group of buildings. "Oxon" has a plan which really is neither one thing nor the other. His idea of a bar is singular, and his elevations show a sad want of study, though at the same time there is an idea of the values of breadth and simplicity. "Hand-in-Hand" marks a design which fails on the score of smallness. This is to be regretted, because the scheme of the plan is not a bad one, and the exterior is quaint and pretty. The author leaves out a chimney in the perspective to get effect, and puts a w.c. on the first floor right in the centre of the house without light or ventilation to insure another result. The plan by "Toujours Prêt" is a bad one; but his elevations have a bold singularity, which, with better detail, might be thought to result from a study of old work. "Virtute et Labore" makes up a design with oddments, and the result, both in elevation and plan, is scrappy. There is, however, a distinctly marked cleverness about the design, and an amount of thought which we fully recognise. In trying again, the author should study to be more quiet; and fudging perspectives, be it remembered, does not improve the value of such exercises, the main aims of which clearly are to insure correctness both of drawing as well as design. "Eton" knows the value of balance in design, and how to vary the parts to give point to the general composition. The perspective in this case, too, does not correspond with the elevation, so the point just referred to is lost in the view, the near gables being made too tall. The plan is a poor one, but the elevations are good. "Barum" is better in his plans; but we are unable to place him higher in the list. "Dunedin" has too cramped an extrance to the publichouse proper, and a front door to the taproom is quite an objection. The details of the plan generally require revision; but need of space obliges us to omit an enumeration of the points. The elevations are pretty, but want further study. The remaining plans are marked by mottoes "En Avant," "V. R.," "Suum Cuique," "Vitruvius," "Cancer," and "Stag."

SUBJECT Q.—A STONE FONT FOR A TOWN CHURCH.

This subject has not realised our expectations, and neither of the contributors has sent us a design worthy of the occasion. "Protoplasmic Globule" is no doubt the best, and if made nicely, the font, according to his drawings, would be a good one. It is, however, not in a truly Late Gothic style; indeed, it hardly can be described under any style in particular. This, in a sense, carries the merit of an originality which we do not deny, but the design lacks interest. "Elean," with a commonplace design, comes second, and "Truth," for lack of a better competitor, registers third. These are followed by "Hand in Hand" and "Cancer."

THE PROFESSION OF A CLERK OF WORKS.—II.*

By Thomas Potter,

Author of "Concrete: its Use in Building," "The Construction of Silos," &c.

(*Continued from p.* 129.)

WHO SHOULD BE CLERK OF WORKS?—SALARY—PLEA FOR EXAMINATION AND DIPLOMA—CIVIL SERVICE CLERK OF WORKS.

WHO should be a clerk of works, and what his salary, are questions the former of which is easily answered, for it has been already explained that the first and main qualification should be as great a practical knowledge of all the building trades and processes as is possible to acquire, an opinion which the majority of architects confirm by employing only those who have had large experience in constructional matters. For all who intend following the profession of a clerk of works, actual work at the bench, the banker, and on the works is the initiatory object which should invariably follow a sound and practical education; physical acquaintance with building materials is the stepping-stone to proficiency in construction. Telford, the eminent engineer, said: "I ever congratulate myself upon the circumstances which compelled me to begin by working with my own hands," and many others have echoed the same words. Classical learning, however valuable otherwise, will be found of little use on a scaffold and in the workshop; far better to first acquire a thorough insight into building details and all the surroundings which have been previously described, if a man is dependent upon his own exertions and intends to obtain his livelihood by acting as clerk of works. There are some strange notions, however, on this point. An eminent architect once said: "A pupil of good education and office experience possessed qualities which compensated for practical knowledge," an opinion by no means general; and if an individual society is debating as to the proper and best means of teaching students the practice of architecture, one of the speakers is pretty well sure to recommend the pupil, after he has passed the greater part of his four years, more or less, as the case may be, in the office of his employer, with now and then a glance at some building in progress, to act for a considerable period as clerk of works. In such a case nothing is said about the employer's interests, or how they are to be protected; but it is quite certain that if an enterprising contractor, bent on making money—no matter how—obtained a fairly remunerative contract in some out-of-the-way place where the architect's visits must of necessity be few and far between, a clerk of works of the description indicated would, according to the opinion of the builder and his men, be an inestimable blessing. It is a unique occurrence, however, to find a suggestion to this effect made at the expense of clerks of works in general; but at one of the meetings of the Architectural Association a few years ago a member made the following curious remarks: "The selection of a clerk of works was a difficult matter; he might drink or connive at builders' dishonesty, or if honest and sober he might prove to be unreliable in many ways, and the architect's pupil even might make a very good clerk of works," &c. The only crumb of comfort to be picked out of these equivocal assertions is that they are very undefined; it is not positively said that the clerk of works does as a rule drink or connive at builders' dishonesty, or is unreliable, or that the architect's pupil would make a good clerk of works; but in a roundabout way such things are hinted at as extremely probable. After all, possibly these expressions were only intended to excite the susceptibilities of the large number of pupils and assistants who were present, and at the expense of clerks of works, who were absent. Architects' pupils are, no doubt, usually drawn from a better educated grade of society; but it does not follow because having received a liberal scholastic education they are thereby rendered more capable, or more honest, or more painstaking, in so far as concerns the superintending of building works. The years of training and patient observation men have to undergo previous to becoming competent clerks of works is *primâ facie* evidence of not having wasted a great deal of time in intemperance and profligacy; admitted, as with architects and architects' assistants and every other calling, so with clerks of works, there are good, bad, and indifferent in their ranks, both morally and otherwise; but that the bad are in excess of any other class is untrue, although so far as qualifications are concerned, and from causes previously described, the indifferent form far too large a proportion. The majority, however, serve their employers, according to their lights, to the best of their abilities and ofttimes with considerable personal risk and discomfort. If we trace their antecedents we find that a small minority belong to the very class who "might make very good clerks of works"—architects' assistants, who, with no hopes of an independent practice, and possessing a taste for construction in preference to the ordinary routine of an architects' office, throw in their lot with, and become in course of time, *bonâ fide* clerks of works. Of necessity, they have acquired, by hook or by crook, a certain amount of practical knowledge; but the want of a thorough technical training in early life is found to be a difficulty which is never thoroughly surmounted. The great majority have, however, been what is called "practical men," or men who, having as boys left school when fit for work or of an age to be apprenticed, have learned and for a time followed for an honest livelihood one or other of the building trades, and in four cases out of five either as carpenters or masons. Some may perhaps be the sons of well-to-do tradesmen, who, with too large a family to give each the means of starting on his own account, have had the commonsense to see that a greater prospect of success in life is obtainable by learning some handicraft than by serving behind a draper's counter, or joining that legion of underpaid humanity—general clerks. However lowly he commences life after learning a trade, the building mechanic, if he proves himself a competent workman, has a reputation for sobriety and perseverance, is energetic, and exhibits a capacity for directing others, is bound before a great while to be selected to take charge of works of minor importance on

* All rights reserved.

behalf of a builder. As his knowledge increases, and as he is found to possess tact and common sense, his advancement is simply a matter of time, more especially if he has received a fair education. From the direction of small and unimportant works to those of a more extensive character is only a natural sequence, and sooner or later he is selected by the architect, whose buildings he may at some time or other have been foreman of on behalf of the builder, and who may be in need of a clerk of works, to fill that position. If he is temperate in his habits, persevering in his duties, and possesses more or less those good qualities and attainments which are so essential, he will probably from that time forward, and to the end of the chapter, remain a clerk of works. These may not be, and in point of fact are not, the only stepping-stones to the "*Ultima Thule*," the highest position on a building next the architect, but they constitute as a rule the chain of events that lead thereto, and they are substantial evidence that sobriety and perseverance must have prevailed up to that point in his history, or promotion would not have ensued, and which certainly could not otherwise have landed him in a supreme position of trust and responsibility. The clerk of works of one or two generations since had, in common with others, every excuse for leading an irregular life; the majority of people, even in the highest ranks, considered it no disgrace to indulge in intemperance and vice, and no wonder the population, clerks of works included, were therefore tainted; but times have changed, a better order of things prevails, and the latter are, as far as regards sobriety and temperate habits, neither better nor worse than their fellows; where undeniably worse it will be found they are not in the first rank of their calling. The majority of clerks of works half a century ago were, in the matter of attainments, anything but what they should have been; but the reason was apparent, for it was not so much a question at that time of qualifications as of salary. A moderate knowledge of one or two trades connected with building was about all required, the equivalent for which was a few shillings more weekly than the earnings of a working bricklayer or carpenter, and the natural result, according to a correspondent of the *Builder* in the year 1847, is described as follows:—"I am sorry to say that too often the clerk of works is a debased and drunken mechanic, truckling to the builder, shutting his eyes for a consideration to all the dishonesty and injustice practised towards his employer, in allowing unsound and improper materials to be used, and weights, measures, and qualities under the specified value, and in many things in a clerk of works' responsible care selling himself to a dishonest and truckling builder." This is a "plain, unvarnished" character for builder as well as clerk of works, but the writer deals with the remedy: "I will prove that architects and employers are the causes of their clerk of works' dereliction of duty. They have yet to learn the fact that in all situations of trust the holder should be well and handsomely salaried. Ask the bankers, merchants, railway contractors, and even builders; they will all answer that where they put confidence and trust they give an adequate salary; it is not only necessary, but it is imperative. Look at your clerks of works holding situations of great trust, temptation, and responsibility: what do you give them? Not sufficient to keep themselves and families in respectability, much less from peccability. Some architects, standing high in the profession, grind their clerks of works' salary down to the wages of a building mechanic. I have shown the result to be the degradation and abasement of the clerk of works, and I think it requires very little foresight to see that in the end nothing is gained, but a vast deal is lost, not only in the moral, but in the monetary point of view. And now let me ask you why should such a state of things exist? I call upon architects and employers to do their duties to their clerks of works, and to improve their moral condition; but first to improve their salaries, and the natural consequence will be that they will be above want, and, consequently, more above temptation. The fact is, architects treat them as common mechanics, and expect them to be immaculate and honest all the while. Where want oppresses, and temptation offers, it is not in the power of poor human nature to resist."

The position of a clerk of works less than forty years ago, assuming this description to be a fair one, apparently left a good deal to be desired, and it must be admitted has very much improved during the interval. Architects do not at the present time treat them as common mechanics, nor grind their salaries down to the level of the mechanics' wages, and the improvement in their moral character and general capabilities is clearly, in a great measure, the result thereof. But it is difficult to see how the increase in salary could have been avoided, even if architects and employers had been so inclined; the building mechanics' wages, in towns at least, are from 25 to 35 per cent. higher now than forty years ago, while competent and efficient foremen and overlookers, instead of being valued at 6d. or 1s. a day more than ordinary mechanics, as was the case then, are considered to be worth at least nearly double the latter. The clerk of works' position in any building would be a very undignified one if it were the practice to pay him less than the builder paid his foreman. This is sometimes the case, however, even now, for a contractor usually finds it answers his purpose to keep exceptionally good men and pay them substantial salaries, more, indeed, than that which the clerk of works receives, while the architect, even if the employer consented, could not raise the salary of the former to the same level in certain cases and not in others where the duties were equally as important. Indeed, it may be taken for granted that it is to the liberality of large employers of labour in dealing with those whom they intrust to carry out their contracts that the average salary of the clerk of works is considerably higher at the present time than was the case formerly; but is it sufficiently remunerative all points considered? Three, three and a half, or at most four guineas a week appears a substantial equivalent when compared with some other occupations, but there are many points to be considered. The clerk of works is essentially a bird of passage. He may be actively engaged in the South of England at the present time, and a few months hence he may be just as busily employed in the North of Scotland. The cost and inconvenience if constantly moving from one part of the country to another, and having no settled home or habitation, are well known.

(*To be continued.*)

NEW THEATRE IN THE STRAND.

ON the site of the old "Coal Hole" in the Strand, a new theatre is in course of construction for Mr. Edward Terry, from the designs and under the superintendence of Mr. Walter Emden, M.S.A., Southampton-street, and will be visited by the Society of Architects to-morrow (Saturday) afternoon. We illustrated the building in our issue of Aug. 27 last year. A considerable clearance of the site was necessary; the old adjoining houses in the Strand had to be demolished, and the Adelphi arches were dug out and the foundations taken down to the original level of ground. The chief feature of the new theatre is the fire-resisting construction that has been adopted throughout, and in this respect the new structure will be unique among the theatres of the metropolis. Special arrangements have been made in order to guard against the spread of fire. Each portion of the house has two exits, the walls of the auditorium are of brick, the dress-circle, first-tier, gallery, and the floors and staircases of iron and concrete. The auditorium, which is at the Strand end of the site, is constructed entirely with wrought-iron trusses and risers forming the galleries. These are circular in plan and rise in tiers; the risers are of angle iron flanges filled in with lattices, the soffits of each tier and gallery having wire netting plastered below. The upper surfaces or floors will be of ironwork, filled in with concrete. Beyond the iron pillars supporting the dress-circle and two upper tiers are shaped-iron cantilevers with curved uprights, upon which the fronts of each gallery will be secured. Woodwork has been very sparsely employed, and only in the doors and windows. That used before and behind the curtain will be coated with Sir Seymour Blane's fireproof paint. In connection with the fireproof qualities of this theatre, we may draw attention to the experiments made before Captain Shaw and other gentlemen the other day to prove the efficiency of the fire-extinguishing arrangements to be carried out by Messrs. Rose, of Manchester. These consist of a complete system of hydrants placed in desirable positions before and behind the scenes, the whole of the stage and "flies" being commanded by a system of overhead sprinklers controlled by valves at the stage door. These sprinklers are connected with the water mains, and are supplied by a 5in. pipe, the pressure being at about 90lb. A large bonfire composed of wood and shavings was lighted on the middle of the stage, the flames rose 25ft. to 30ft., when the signal was given to open the valves and admit water through the sprinklers. From these a deluge of rain poured down from the roof, and the fire was subdued in a very few seconds, and one jet finished the work of extinction. The sprinklers are set at an angle commanding stage and flies. The body of the theatre is quite distinct from the stage, each portion being independently ventilated, and each tier has two exits. The auditorium is planned to accommodate about a thousand spectators; the angles next the stage are slightly canted, and a wide and well-arranged entrance gives access from the Strand, the pit entrance being in Occidental-court. The elevation towards the Strand has two ornamental gables; the facing is to be of red brick and stone, with Burmantofts faïence introduced in the balustrading of first-floor windows, and in other parts. Elliptical arches with stone voussoirs are proposed on the ground story and entrance. The contractors for the work are Messrs. Holliday and Greenwood, Loughborough Park Works; the superintendent of the works is Mr. H. F. Sheppard, Mr. Egan acting as clerk of works under the architect. The works are being proceeded with night and day.

THE CITY OF LONDON SURVEYORSHIP.

THE City Court of Common Council had an animated discussion at their last meeting on a report from the Officers and Clerks' Committee as to the nature, duties, and emoluments of the office of City Architect, rendered vacant by the death of Sir Horace Jones. The committee, by a casting vote, had decided to recommend that the office of City Architect should be abolished and the appointment in lieu thereof of a "City surveyor and clerk of works" at a salary of £800. In moving the adoption of the report, Mr. Sly said the Court required a surveyor every week in connection with the City lands and estates, but would not want an architect four or five times in twenty years, when they could easily put the work out "to tender." Mr. Edmeston strongly urged that the office of City Architect be continued, and argued that even if there were no new buildings wanted, questions were constantly arising as to buildings, and architectural competitions, on which they proposed to rely, were wrong in principle and led to abuses. Mr. Beck, on the same side, argued that there was not a single building which had been competed for that did the Corporation credit. Major Joseph contended that it would be economical to continue the office of City Architect, for during the last twenty-three years £1,531,800 had been expended on buildings under the charge of that official, and the commission of 5 per cent. on this would have been £76,590, equal to a salary of £2,890 a year, whereas they had paid Sir H. Jones £53,128 in salary and gratuities. Mr. J. C. Bell corrected this statement, saying Major Bell had omitted £8,996 paid for plans, and said the Court had expended personally on the late City Architect £62,331, equivalent to £2,833 a year. The proposed change would effect a saving of £2,800 on the chief officer and his staff. Mr. Malthouse said, with all this expenditure, the major part of the architect's business had been "put out." In the case of Holborn Viaduct they employed Colonel Haywood, and paid him the enormous sum of £17,000 to do the work the architect ought to have done. When they built a bridge over the Thames they employed an outside man, and paid him something like £30,000. He believed the humblest surveyor in the City would have laid out the Central Meat Market much better. The Fish Market, again, was like some old country workhouse. Let them go to St. Pan-

cras, and see the building there designed by a young surveyor. Deptford Market was one hundred years behind. He referred to a work long delayed, which could not be done by the "superior intelligence" of an official, and which was done in a very short time by the working bee—Mr. Murray. On a division upon an amendment that the appointment of City Architect should be continued, the numbers were equal, when, according to custom, the Lord Mayor voted in the negative, but the report was subsequently referred back for reconsideration and for fuller information.

THE MAPPIN ART GALLERY AT SHEFFIELD.

THE Mappin Art Gallery, originated by a bequest from the late Mr. J. Newton Mappin, was opened on Wednesday. It was Mr. Mappin's intention originally to bequeath his pictures to South Kensington; but shortly before his death, in October, 1883, he left the whole of his collection, valued at from £50,000 to £70,000, to the town of Sheffield, and also a sum of £15,000 for the erection of a suitable building in which the pictures might be hung for exhibition. The gallery has been erected in Weston Park, and is in the Ionic style, having a central hall, in which the late Mr. Mappin's pictures are placed, and six other galleries. One of the latter is filled with pictures presented to the town by Sir Frederick Mappin, Bart., M.P., nephew of the late Mr. Mappin, while the remainder are occupied by a collection of paintings lent by distinguished artists, and by private owners in various parts of the country. The collection bequeathed by the late Mr. Newton Mappin includes a series of the finest works of J. Pettie, R.A., amongst them being his "Conspirators," "The Flag of Truce," "The Sally," "War to the Death," "The Drumhead Court-martial," &c. Several of these passed into the possession of Mr. Mappin direct from Pettie's studio. There are also several important works by J. Philip, R.A., and two unfinished pictures which exhibit the dark background on which this great colourist was accustomed to work. Two or three pictures by Sidney Cooper, R.A., are likewise included, and the collection is rich in the works of John Linnell, including "The Haymakers," and a smaller work—a landscape, with sheep that are being hurriedly driven to shelter from a coming storm—for which Mr. Mappin paid the artist 1,500 guineas. There are two works by Sir Edward Landseer, of which one is "The Stray Shot," left unfinished, and purchased by Mr. Mappin for 2,000 guineas. It was subsequently completed by Rosa Bonheur. Mr. E. M. Ward, R.A., is represented by his "Fall of Clarendon," and there are several works by Fredk. Goodall, R.A., B. W. Leader, A.R.A., T. Creswick, R.A., Marcus Stone, R.A., Clarkson Stanfield, R.A., T. Faed, R.A., and W. P. Firth, R.A. The collection given by Sir Frederick Mappin includes a large example of Sidney Cooper, two by Goodall; a finished sketch by Maclise of his fresco in the House of Lords—"The Spirit of Chivalry"; and other works by H. W. B. Davis, Muller, &c. In the loan collection Sir Frederic Leighton, P.R.A., is represented by "Weaving a Wreath," lent by Mr. George Holt, of Liverpool; and among other works are Mr. E. J. Poynter's "Diadumene," Mr. Edwin Long's "Pharaoh's Daughter," Mr. E. A. Waterlow's "Sunny Hours," and Mr. A. C. Gow's "Absolution for the Lost at Sea."

BUILDERS' BENEVOLENT INSTITUTION.

THE 40th annual meeting of this institution took place on the 21st inst. at Willis's Rooms, St. James's, Mr. Basil E. Peto, President, in the chair.

Major Britton, the secretary, read the annual report, which stated that during the past year ten deaths had occurred among the pensioners, and nine who were waiting for the benefits of the charity had been elected. The total number of pensioners was 32 men and 33 women, who necessitated a large annual expenditure, and caused deep concern in the minds of the committee to obtain new subscribers, the more so as many who had for years given regularly to the institution had been removed by death. The income of the institution for the past year had not been sufficient to meet the expenditure, and it had, therefore, been necessary to withdraw the balance of the reserved fund. The committee were under great obligations to Mr. Basil E. Peto for his valuable aid during the past year, and were pleased to announce that Mr. H. H. Bartlett would be the president for the ensuing year. The annual dinner would take place at Carpenters' Hall on 3rd Nov. next. The report and accounts were unanimously adopted. Votes of thanks were passed to the president for the past year, to the vice-presidents, the trustees, and to the treasurer, Mr. George Plucknett, J.P., who was re-elected. Votes of thanks were also accorded to the committee, the retiring members being re-elected, and Messrs. Basil E. Peto and A. Moore added to their number, and a similar compliment was paid to Messrs. Ward, Bolding, and Duffield, the auditors. Mr. Plucknett proposed Mr. H. H. Bartlett as president for the ensuing year, which was seconded by Mr. T. Stirling, and agreed to. A vote of thanks to the chairman closed the proceedings.

BOOKS RECEIVED.

Designing Wrought and Cast-Iron Structures (Part IV.) Notes and Calculations for a Trussed Fir Beam with a Rolling Load; a Cast-Iron Stanchion and Riveted Joints. By HENRY ADAMS, M.Inst.C.E., M.S.A., &c., Professor of Engineering at the City of London College (London: 60, Queen Victoria-street).—This is another useful guide to designing ironwork. Part IV. treats of the mode of designing a trussed fir beam 20ft. span supported at ends, and carrying a rolling load of 4½ tons. Architects have often to make drawings for such beams, such as a trussed purlin. The trussing shown in the example is external, the ends of tie-rod being secured to plates and screws at the ends of beam, and having a strut below it. Mr. Adams enters into the reasons why the type he selects should be chosen; the compressive strength of the timber, the depth of trussing, and the stresses borne between the strut and end of beam. The notes, calculations, tables, and stress diagrams are important helps, and are arranged as in the author's previous publication, each step of the process being worked out in figures. Thus the scantling necessary to support the load between strut, and one end being obtained, namely, 13·1sq.in., the size is increased for the compressive strength in the longitudinal direction the addition of 17·14sq.in. being made, which gives 13·75in. square for the beam. The truss is then drawn, and the loads apportioned so as to find the stresses in compression, which are found to be 9·644 tons. Then, 9·644 tons at $\frac{3}{10}$ ton per square inch = 32·15sq.in., while 13⅜in. square gives over 180sq.in., proving that the sectional area is ample. The stress in each tie-rod is 9·94 tons, and at 5 tons per square inch safe load $\frac{9\,94}{5}$ = 1·99sq.in. net area = 1⅝in. diameter. Two rods are used instead of one, so that $\frac{1·99}{2}$ = 1sq.in. is given to each, say, 1 3/16in. diameter. Other details are found by the same analytical method, and after they are all proportioned, the design is drawn out to a scale of 1½in. to a foot. Mr. Adams shows how the stresses can be obtained by measurement from the diagram or by calculation, so that the student can readily adopt the easier of the two processes. The second section deals with a cast-iron stanchion or story post 10ft. high to carry a dead load of 36 tons, and the question is solved after a similar fashion. A section of stanchion 8in. by 8in. by 1in. is found sufficient to carry the load with safety, and the details are drawn out to scale. The series of parts are invaluable to all students and engineers.—*Walks in the Ardennes*: With Fishing and Shooting Notes. Edited by Percy Lindley (London: 125, Fleet-street), is a tourist's guide-book, describing in an agreeable, chatty style a cheap holiday tour, and is a welcome companion to the other holiday handbooks in the same series of Great Eastern Railway Company's handbooks. Besides a sketch map of the Ardennes, the guide is artistically illustrated by Julian F. Weedon, and is varied with boating, cycling, and fishing notes. The Ardennes district is one of the cheapest, and embraces many places of interest. Antwerp is within a few hours of London, and the green-shored Scheldt is a pleasant way to it; Brussels, Waterloo, Dinant on the Meuse, Namur, Liege, Louvain, are all within short distances. Mr. Lindley's readable little guide is very timely.—*A Guide to the Choice of a Site for Residential Purposes*, by a Member of the Geologists' Association (Redhill).—The author of this little brochure has collected a number of authorities in therapeutics and climatology, showing the advantages of high-lying dry sites as remedial and preventive of disease. The author favours high-lying sites on the chalk as being drier. He has, consciously or not, we do not know which, made a serious indictment against a large portion of the area included in Greater London, which is of clay soil. The author says a great many people in London "do not know what a clay soil is, especially as regards its evil influence on climate, although many do know. Carefully avoid the clay districts comprised within the area of Greater London, which not only show themselves to be clay by the predominance of the oak and by their general flatness, but also by still remaining in pasture unoccupied by houses although only six or seven miles from the Bank." This appears to be a very strong indictment against South London as a residential locality. The compilation will help many to form an opinion as to the desirability of certain districts for residence, and help them to avoid flat, low-lying clay soils. Opinions culled from eminent physicians are classified, the names appended. It is well known that and rheumatism, catarrhal affections, heart diseases, and consumption are induced in damp soil, and that greater extremes of heat and cold can be borne in a dry climate than in a damp one. As Dr. Lee and Dr. West say, in their works on climate, dry air favours excretion of moisture from the lungs and from the skin by means of insensible perspiration, while in moist air the perspiration accumulates on the surface of the body. From these facts, it is not hard to see why Southport, which is on clay, is less healthy than New Brighton, which is on a sandy soil. Elevated sites are drier and warmer than low ones; sheltered and timbered districts are less healthy than exposed and treeless places like Brighton. These are propositions in which there is some truth; but cannot the climate cure be carried too far, and are not wooded countries more endurable for the invalid than "sunny and treeless" Brighton?—*Transactions of the American Society of Civil Engineers* is to hand, and contains a few interesting papers—one on the "Formulas for Weights of Bridges," by A. J. Du Bois, and the discussion thereon.

MOSAIC DECORATION AT EATON HALL CHAPEL.

WE have seen an interesting series of 26 cartoons at Messrs. Burke and Co., Newman-street, designed and drawn by Mr. Shields, to be translated into mosaic for the internal decoration of the chapel at Eaton Hall for the Duke of Westminster. These mosaic pictures are intended to be placed along the north wall of the chapel in two series of figures, the upper one representing the "Goodly Fellowship of the Prophets," and the lower series the "Holy Church Throughout all the World." The chapel has the apse at the west end, and a large east window of painted glass at the other. The artists, in the treatment and colour of these figure designs, have endeavoured to avoid the extremes of the crudeness of outline found in ancient examples and the later pictorial treatment, and we think they have succeeded in ridding the design of the conventional rendering and accompaniments so often found in the art of this class. The prophets are arranged in Scriptural order, the cartoons representing figures of Enoch and Noah, Jacob, Moses, David, Elias, the series concluding with Malachi, who is shown pointing to the fulfilment of the prophecy, and of the coming of Christ. John the Baptist, and the disciples SS. James, John, and Peter, occupy positions in the east window. Throughout this series Mr. Shields has broken away from the conventional accompaniments of the prophets: he has rather presented the spectator with a series of conceptions of spiritual visions, in which there is an obvious connection. In the figure

of Ezekiel, *e.g.*, the artist has, by a thorough study of the prophet and his commission from God, represented the signs which accompanied the revelation. Thus, God's hand is shown on the head of the prophet with a roll of the prophecy. He is depicted with a shaven head, in pursuance of the description we find in the fifth chapter of Ezekiel, where under the type of hair is shown the judgment of Jerusalem. He is directed to take a razor and to pass it upon his head and beard and to weigh and divide the hair; to burn a third, to "smite" another portion," and to scatter to the wind the other third part. The figure represents also strength: a cross is set on the forehead, and he stands amongst briars and thorns and scorpions. The figures of Enoch and Noah are equally characteristic and typical. In the former is typified the wickedness of the world; the serpent of the latter represents the flood, Noah pointing to fire above and the bow in the cloud as the token of a covenant. In each of the figures the artist has embodied the leading incidents and attributes very skilfully; the drawing is remarkably free from archaicism, and the colouring subdued and soft. The main consideration of mosaic has been kept in view, the figures being handled with sufficient freedom to tell the story, yet not with such obtrusive individuality as to lose sight of the relation to the architecture.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

A GENERAL meeting of the donors and subscribers took place on Tuesday evening, the 26th inst., at the offices, 21, New Bridge-street, E.C., the president, Mr. W. R. Freeman (Messrs. John Mowlem and Co.), occupying the chair. The president was supported by Mr. E. Brooks (treasurer), Messrs. C. K. Turpin, J. Robson, H. W. Parker, W. D. Gilbert, F. Burchell, E. C. Roe, and other gentlemen. The meeting was convened for the election of pensioners and amendment of rules, the election taking place first, when Louisa Hadrill, Maria Bowtle, and Eliza Holding were returned by show of hands to the widow's pension of £20 per annum, a ballot not being necessary, as the numbers of candidates and of vacancies were the same. There were but two vacancies in the first instance; but a third was specially announced in honour of the Queen's Jubilee, and thus the three cases were elected without the candidates being put to the harass and expense of a contest.

The following "amendments" of the rules were then submitted and adopted, viz.—

Rule II. Sec. 3, add, "For the purposes of this Section, it shall be lawful for the trustees to purchase presentations for periods of 21 years in such institutions as a general meeting may from time to time sanction in the names of the trustees of the Builders' Clerks Benevolent Institution."

Rule XIX., add new Section: "That the holders of each presentation purchased in pursuance of Rule II. Sec. 3, shall bind themselves to use such presentation only in favour of such candidates as shall be elected by this institution, and to conform in all points to the rules thereof, and to the rules of the Institution into which the child is to be presented."

At the close of the business a cordial vote of thanks was presented to the president, not only for his services that evening, but for the active personal interest taken by him in all that pertained to the welfare of the institution.

WEIGHTS OF BRIDGES.

PROFESSOR A. J. DU BOIS, of the American Society of Civil Engineers, has introduced a method of dividing bridge weights into those for floor system, lateral system, and trusses. He presents a series of rational formulæ which accommodate any specifications and design, and give the weight of iron for any given style, and enable the best depth and length of panel to be adopted. Taking the floor system first, Prof. Du Bois shows that the weight of rails, ties, planking, &c., is tolerably constant for all railroad bridges. These elements of the floor are estimated at 400lb. per lineal foot for a single track. The stringers and cross girders are next considered. For weight of a plate girder Prof. Du Bois gives the following formula:—

$$\text{Weight of a plate girder in pounds,} \quad \left\{ \frac{12\ W\ l^2 + 2\ R\ l\ d^2}{1{\cdot}2\ R\ d - 12\ l^2} \right.$$

where l = span in feet, d = depth in inches, R = average flange stress in pounds per square inch, W = total external load in pounds, including allowance for impact. This formula has been tested by actual weights, a table of which is appended, and the formula gives results very close to the actual weights. From this formula the author shows how the best economic depth can be found. The formulæ we cannot give here, but the author gives tables constructed from them assuming the live-load system. By the tables furnished for iron plate stringers of uniform depth and cross girders of uniform depth, any engineer can calculate his weights without recourse to the formulæ. The weight of stringer for any panel length in accordance with the live-load system can be found. The weight of iron in floor system having been estimated, the best depth of any plate girder bridge can be determined. The author shows the application of the tables by an example and the saving of calculation effected. Bridge trusses are then considered, the author entering into an analytical demonstration of the formulas. These we must say are more complicated than the author is willing to admit. Thus the formula for economic depth in feet is far too intricate for engineering purposes. The tables, however, supply all that the practical engineer asks for. The data which enter into the problem of weight are introduced, and the formulæ can be applied under any specifications and loading. Prof. Du Bois's system is a rational one: the weight of floor depends upon panel length and the amount of distributed weight on engine wheels, the lateral system depends also on panel length and wind pressure, that of trusses upon panel length and combined live and dead loads; all these factors have been dealt with. The only uncertain factors are those derived from the specification requirements.

WOOD MOULDINGS.

WE have had sent us a box of specimens of hardwood mouldings manufactured by John Eede, Butt, and Sons, timber and slate merchants, Gloucester-road, Brighton, and Littlehampton. These contain oak, walnut, and other hardwood mouldings, plain and enriched by ornaments suitable for architectural purposes, such as architrave mouldings, cornices, transoms, strings, picture frames, and other uses. The specimens we have are rebated for frames, but the process of manufacture is, we are informed, capable of producing a great variety of patterns. Nothing in the way of wood enrichment can look cleaner or sharper; the ornament is judiciously introduced in the angles of moulding in the shape of dentil, billet, dog-tooth, and other architectural ornamentation. Very effective combinations are made. One moulding very suitable for a picture frame consists of an outer frame moulded at the edge and reeded with a plain inner face rebated for the glass, and with a small hollow moulding round "sight line." One of these is made of walnut, with an oak (polished) inner frame, and is very effective, and suitable for drawings and engravings. Another narrower moulding has a "quarter-round" worked on each edge with fillets, the centre enrichment being the dog-tooth. The larger specimens embrace some built-up mouldings, suitable for architraves, with outer moulding, angle enrichment, and two inner faciæ. The ornament is introduced separately in the angles and glued in, but is so neatly and accurately executed that it would be difficult to distinguish it from carving out of the solid. Greater accuracy is insured by this mode of insertion. Messrs. John Eede, Butt, and Sons have succeeded in producing a class of hardwood mouldings that cannot fail to meet with appreciation from architects and decorators. For superior internal woodwork and joinery the enriched mouldings are admirably adapted, and the mouldings are of an artistic character, which is more than can be said of the ordinary machine-made mouldings in the market.

OUR COMPETITORS' COLUMN.

WE are altogether disappointed with the response to our ninth competition, inviting a short essay naming the architect who, during the past thirty years, had most decidedly influenced ecclesiastical architecture in England. Only three papers have reached us, and none is worth printing. Two of the authors name Sir Gilbert Scott, and the third appears to be uncertain, and rambles at some length through the list of the principal ecclesiastical architects of the past generation. All three competitors fail to reach publication mark, and we have no alternative but to withhold the prize.

We now offer another prize of One Guinea for the best paper giving

THE EXPERIENCES OF AN ARTICLED PUPIL,

comprising such hints for self-improvement and the best utilisation of time and resources as may benefit others. Papers giving actual personal experience will be preferred. To be sent in by July 29. This will conclude the series for a few weeks, when the column will be revived, together with a new series of the Designing Club.

CHIPS.

Mr. W. J. Jennings, for many years assistant to the late Mr. J. G. Hall, architect, of Canterbury, has arranged to carry on the private practice of his late employer in conjunction with Mrs. Hall, and has been appointed to succeed Mr. Hall as engineer of the Edenbridge drainage works.

Dr. Moorhouse, Bishop of Manchester, consecrated on Friday the new church of St. Anne's, Shevington, near Standish. The cost of the new structure has been £2,000, and it will find accommodation for 260 persons; it has been erected by Mr. Ward, Upper Brook-street, Manchester, from plans prepared by Mr. Charlewood, architect, Manchester.

At the last meeting of the Royal Irish Academy Mr. Hugh Robinson, President of the Belfast Naturalists' Field Club, and secretary of the Government School of Art at Belfast, was elected a member.

Memorial stones of a new Wesleyan chapel at the corner of Southbank-road and Ash street, Southport, were laid on the 22nd inst. The new building will furnish sitting room for about 600 persons; the cost of the structure is estimated at £5,000. The architects are Messrs. Waddington and Son, and the contractors Messrs. Fairbridge and Hatch, of Birkdale.

The tower of the village church of Warslow, near Leek, Staffs, was destroyed by fire on Wednesday week, together with its bells and clock.

The partnership between Messrs. Filliter and Rofe, of Leeds, and Victoria-street, Westminster, civil engineers, has been dissolved.

The last section of the Barking and Pitsea line of the London, Tilbury, and Southend Railway Company, that between Horndon and Pitsea, is approaching completion, and the extension, by which the route between London and Southend will be considerably shortened, is to be opened in the autumn.

The new buildings of the Railway Servants' Orphanage at Derby, opened by Lord Hartington on Wednesday week, have been built at a cost of £10,000, from designs by Mr. A. A. Langley, the engineer of the Midland Railway, who gave his services as architect without charge, and the contract has been carried out by Mr. Edward Wood, of Derby. The buildings are of brick, with stone dressings, and accommodation is provided for 300 children.

The Horncastle Local Board, in consequence of the hard times, have reduced the salary of the surveyor, Mr. Boulton, from £76 to £70 a year.

Two statues have been placed in St. Austin's R. C. Church, Stafford, in honour of the English Martyrs in the reign of Henry VIII. lately beatified. They were carved in Caen stone by Mr. Wall, of Cheltenham, and represent the Blessed John Fisher and the Blessed Thomas More.

Two colossal female figures representing "Manufacture" and "Navigation" have just been erected in the parapet of the new front of the Devon and Cornwall Bank in Bedford-street, Plymouth. They are wrought in Portland stone, and were executed by Mr. Harry Hems, of Exeter.

The Buxton local board have accepted the tender of the Arlesey Lime and Portland Cement Company for the supply of 1,000 tons of their Eddystone Portland cement for the construction of the Hogshaw reservoir.

A new organ, by Messrs. Foster and Andrews, at Hull, has been erected in Ayr Cathcart-street United Presbyterian Church.

WAYSIDE NOTES.

A SUM total of seventy-five farms, within sight of a certain standpoint in the county of Essex, all of which are without tenants and many actually out of cultivation, is a "terrible list" indeed, and forms a good index to the present state of the farming interest in England. Mr. Arthur Pryor's letter to the *Standard* gave the details of this sad condition of rural landlords and farmers, and sets forth the names of the farms, the parishes wherein they are situate, and their acreage.

Twenty-one thousand four hundred and seventy-two (21,472) is the total number of acres in these seventy-five Essex farms, two of which comprise one thousand each. Happy Essex! Real estate in our country is practically unsaleable; houses are a drug in the market; they will neither let nor sell; and farm lands are often not worth cultivating at present prices. Merrie olde England!

What a contrast to this stagnation of all our industries is the state of the land, house, and labour markets in the Far West of America—new England! In the June number of *The West Shore*, published at Portland, Oregon, U.S.A., the writer of an article on the cities of British Columbia says:—"Another city of more than local fame, already the second in size in the province, is Vancouver, the terminus of the Canadian Pacific Railway. One year ago the town site was a dense forest, and now a large portion of it is covered with buildings, some of them of brick, and many streets are laid out and planned, while the sound of the saw and hammer, the ring of the mason's trowel, and the loud reports of blasts constantly salute the ear, impressing one with a sense of restless energy."

An engraving represents this Wild West of a year ago, with a King of the Cowboys, or other pioneer, riding therethrough; while another picture shows a street with houses, stores, and telegraph wires of to-day. The writer further says that "the present improvements have risen on the ashes of their predecessors, for on the 13th of June, 1886, the city was almost destroyed by fire, only two or three small buildings being saved. Since then upwards of a million dollars have been expended in improvements, and a city of 5,000 people has sprung into being, and is growing daily in population and structures. The greater number are for business purposes, but many cottages and a number of excellent residences have been erected. Several brick blocks have been completed, or are under way, one of which is being fitted up for two banks—the Bank of British Columbia and the Bank of Montreal. The improvements under way and projected, including the street improvements, gasworks, waterworks, and railroad buildings, approximate 2,000,000 dollars in value."

Even discounting liberally for the enthusiasm of the writer, and the fact of the place being on American soil, this certainly looks like sharp, go-ahead work. And it is well, in passing, to note the difference between a rapid and healthy growth and the "run-up" productions of our jerry-building. One is the outcome of necessity, and the other of excessive greed of worldly gain. The new city is full of wholesome vigour, and its life-blood pure and unalloyed; but on the bloated carcases of old cities bad building flourishes like a fungus—rank, poisonous, and thriving upon the attributes of death and decay: a hydra-headed monster, its veins full of a venous fluid, carrying the germs of many national and individual, physical and moral, diseases.

Of current competitions the latest (barring any that may appear in this issue) is the one advertised by the Swinton and Pendlebury Local Board for public baths. The board's advertisement, doubtless, has been followed by applications from all parts to know whether a professional assessor will be engaged to assist them in their decision, as also many other questions on points where the conditions seem vague; whereupon, it is to be expected, the Swinton people will reply, as per usual, that an assessor will or will not be appointed, and also add more or less matter about perspective, levels of drains, &c. It is very curious that so few particulars are ever issued at all complete, and self-explanatory on all points. When the above correspondence has ceased it will be time to send in the plans (?), for it seems to me that competitors have only been allowed about ten clear days to perfect their designs.

A competent assessor will be very necessary in the Swinton competition, as in the matter of of baths practical and good planning is of infinitely more importance than the appearance of the building; and, in fact, the designing of such utilitarian edifices is almost a speciality. Arrangement is everything. Nothing is more unpleasant than a dark, dirty, damp, and unventilated bathroom, be it small or large. Yet, unfortunately, one often finds baths that are scarcely fit for cattle. Without a doubt, the cleanest, most orderly, and best swimming-bath I have ever seen is one at Brussels, where the arrangement of everything, down to the neat nautical costume of the attendants, is excellent.

The inaugurators of the Douglas, Isle of Man, competition seem determined not to have a failure through want of sufficient advertising. Have not seen the conditions, so cannot say anything about it, excepting that, as things go, the premiums appear to be liberal. So does the £25 for a public hall at Helston, wherever that worthy city, town, or village may be. There is a small parochial building required at East Grimstead, but, if I remember rightly, the premium does not exceed a £5 note. There is a good deal of work just now for the wholesale competitor, but the retailers should "keep their powder dry" for a season. We sadly want another Imperial Institute or other large competition, but when it comes let us hope it will be open to all.

"One Anxious to Know" asks for the names of a few reliable works on composition and design in architecture. There are none—or, rather, there are no books that are entirely devoted to general first principles as distinct from principles of style, although many may profess to do so. But to explain this it is necessary that these notes should be temporarily extended by the space of one column, if Mr. Editor can spare it. As the subject is so little discussed, and yet is above all others in importance to the true architect, I offer no apology for making the innovation.

It is possible that the reason we have so little literature upon first principles of design and beauty in architecture, is that the difficulty of abstracting these principles and deducing rules therefrom is so great. Differences of taste, style, the influence of association, and many other circumstances, all tend to render our present architectural storehouse a mere promiscuous heap of forms, more or less beautiful, but whose adoption by the designer is seldom governed by a more durable principle than the ever-varying demands of fashion. But, in spite by this seemingly hopeless chaos, order may be established and a sheet-anchor welded for his use by each earnest seeker after truth if he will but patiently study all styles of design, and endeavour to abstract therefrom their first principles of beauty. These principles will be found to be the same in all true architecture: they are the unalterable laws of beauty and fitness that must remain unchanged for all time.

In order to get an insight into this method of abstraction and generalisation, it is necessary to read, mark, learn, and inwardly digest very many works on art and architecture—more than can possibly be named here, because good hints and suggestions are scattered about the pages of a vast number of books treating on these subjects. But of those it is possible to mention, first and foremost I place, without hesitation, the noble work of Mr. John Ruskin, "The Seven Lamps, or Spirits, of Architecture." This book, however, must be studied with the utmost attention and thought. Much of the matter contained in it is useless to the superficial reader; but to the thoughtful student (we are all but students) it is eminently suggestive and valuable on this account. The artistic diffusion of light and shade is Mr. Ruskin's chief principle, and rules the whole of his works. "The sun was risen upon the earth when Lot entered into Zoar."

Providing that one is able to read with a resolve to think out problems for oneself from suggestions obtained whilst reading, *all* Mr. Ruskin's works on art and architecture will be found of the greatest value. The "Modern Painters," read with a view to abstracting first principles of beauty, is a storehouse of valuable information. There is so much in the laws of good architectural composition that also applies to that of other arts, that a treatise on painting, sculpture, or even musical and literary composition, may be read with benefit. The principles of gradation and contrast are universal.

For the elementary laws of architectural massing Garbett's "Principles of Design" should be read. Pugin's "True Principles" should be studied, but it is well to remember the distinction between principles of *style* and those generalised principles that apply to all true architecture. Style is the rock upon which so many who would treat of first principles are wrecked. It is astonishing that Gwilt, in his thousand odd pages, devotes but a page and a bit to "General Principles of Composition"! But the chapter on "Beauty in Architecture" in this work is worth attention. Read, too, Alison's "Essay on Taste," and study carefully Hogarth's "Analysis of Beauty." Fergusson is suggestive for outline. Study in the manner indicated above *all* writers on architecture, abstracting therefrom their hints on composition, and deduce your own rules. Viollet-le-Duc's many books should be carefully studied in this way.

After all that may be said and written about composition and design, the one eternal rule of fitness is worth every other as a test of a work of architecture, both as to use and appearance. And simplicity goes hand in hand with fitness. Longfellow might almost have been writing a treatise on architectural design when he said: "Simplicity in character, in manners, in style; in all things, the supreme excellence is simplicity." A noble thought; one that is directly suggested by Nature in her grandest moods. Where is the complication in what we can realise of the design of the universe, or the mass and motion of its rolling orbs? There is more intricacy in the form and movements of the worm that grovels in the dust of the earth. Let us, then, in imitation of Nature, be simple and unaffected in our composition, and if we must have complication, let it be in the merest and most insignificant detail.

As I take it, it is a sure test of a perfect architectural composition that it should be pleasing in the distance as well as near at hand, that, like a true friend, it is worthy in our presence and faithful in our absence. That when we set out, at the dawn of day, on a pilgrimage to a noble work of architecture, its shadowy outline will break the distant horizon in a beautiful manner against the cool-tinted background of sunrise; that as we advance the disposition of its mass may be equally pleasing; that on our nearer approach the grouping of its features should be a thing of beauty, and its colour and texture appear harmonious; that when we have toiled across the intervening plain, and stand beneath its portals, we may read a lesson in its minutest carvings, and marvel at the beauty of every detail; and that, lastly, when we pass from the heat of the day to the cool shadows of its aisles and cloisters, we may yet find greater glories than were before revealed to us.

GOTH.

Memorial stones of a new Baptist chapel now in course of erection in Aglionby-street, Carlisle, were laid on Thursday, the 21st inst. The building will be Gothic in style, and will be faced with stone; the internal fittings, including open-timbered roof, will be of pitch-pine, and provision is made for the addition of galleries at a future date. Without these the chapel will seat 490 persons, and will cost £2,300. Mr. M. C. Williams is the architect, and the contractors are—builder, Mr. Gordon, English-street; joiner, Mr. Edward Wilkinson; plumber, Mr. Sowerby; painter and glazier, Mr. D. Canning; plasterers, Messrs. R. M. Ormerod and Son; slater, Mr. Smith.

Building Intelligence.

Bombay.—The keystone of the large central dome of the G.I.P.R. Terminus and Administrative Offices, now in course of completion at Bombay, has been placed in position. The cupola is the first of its dimensions to be constructed in solid blocks of stone, without an additional covering given to European domes. It is octagonal in form, and eight ribs converge to the apex, which will support a colossal figure of Progress. The vaulting between the ribs is cut on the outer face into the shape of tiles, so as to prevent rain from penetrating the joints of the masonry. Each ring or course has radiating joints horizontally towards the centre and to the centres of the curves of the dome. The upper outer belt of each course is perfectly horizontal for about three inches, and weathers the next course below it by a slight projection or lap similar to that of the tile. The stones of the rings of the vaulting are keyed or dovetailed into the sides of the large ribs, and between the joints of the voussoirs, on the upper side, strong metal keys are inserted, and the whole set in Portland cement. In its construction no course was commenced until the one below it had properly set and was complete. Each ring or course of masonry was made the support of the next above it, and thus the usual centring was dispensed with, and the contractor saved a considerable sum of money. The construction of the interior of the dome will be open and exposed to view. The carvings throughout the structure have been executed by students of the Bombay School of Art under the direction of Mr. Griffiths, the principal; but the figures to crown the dome and gables are supplied by Messrs. Earp and Son, of Lambeth, S.E. The entrance hall is paved with Maw's encaustic tiles. The clocks, the largest of which has two dials each 10ft. 6in. in diameter, 116ft. apart, and driven by one movement, and another 8ft. 1in. diameter, are supplied by Messrs. Lunn and Blockley, of London. Mr. F. W. Stevens, F.R.I.B.A., A.M.I.C.E., of Bombay, is the architect, and Mr. S. Khanderao his chief assistant. We illustrated the interior of the terminus in the Building News for Oct. 22, 1886.

Bristol.—Mr. J. L. Pearson, R.A., has just reported to the city council on the condition of the Mayor's Chapel on College Green. He remarks that the many beautiful features of the church are now sadly obscured by injudicious alterations and additions. The interior, when opened out, will, from its lofty proportions, have a very imposing effect, while the east end externally possesses a dignity rarely met with in buildings of much greater importance, and the little sacristy on the south side of the chancel is one of the most beautiful examples of 15th century work. As originally erected in the 13th century, it appears to have been a cross church, to which, early in the following century, a south aisle was added, and which was, no doubt, used as a chapel. The next alteration was a remodelling, or rebuilding, of the chancel. Later still, the tower was erected, taking the place of the south transept, and last of all a monumental chapel was added, filling up the space between the tower and the south aisle to the nave, and with an entrance to it from the south aisle only, an arrangement almost, if not quite, unique. Mr. Pearson regards the modern arrangement of steps and entrance at the west end and the nave seating as inconvenient and unsightly, while he points out that other disfigurements have been made which should be removed. He proposes to open out the archway on the north side of chancel, to rebuild the transept with a low vestry attached to it on the eastern side, and to provide a covered way or cloister for access to this transept and to the vestry. He would also remove the western porch, and insert an entrance of appropriate character and on the street level, and with a flight of steps inside down to the level of the nave floor, to remove the gallery, and repair the west gable. He should like to open out the east end by the removal of some at least of the buildings which crowd round it, to open out the walled-up windows, and to provide new floors, pulpit, oak chancel screen, and seats. The total cost is estimated at £3,510. The city council has been recommended by a committee to adopt the report, and to carry out the works from Mr. Pearson's plans, and under his directions. The College Green front of the chapel was illustrated from a drawing by Mr. Louis Knapp in the Building News for March 18, 1881.

Clevedon, Somerset.—A Franciscan church at Clevedon was consecrated on Friday. It has been built from designs by Father A. J. Scoles, of Bridgwater, and is in the Early English style. The walls are of local stone with freestone dressings. It consists of nave and a sanctuary, and side aisles terminating at their eastern ends in chapels, that on the north dedicated to St. Francis, and the southern one to St. Anthony of Padua. The sanctuary is approached by five steps and the altar by three others. The building is heated by hot-water apparatus. It is 120ft. long and 50ft. broad inside, reckoning the nave and aisles, and a congregation of 700 persons will be accommodated on open benches. The roof is covered with Major's patent weather-proof tiles. Mr. Kitch, of Bridgwater, was contractor, and Mr. Bradfield, of Bridgwater, executed the masons' work, local labour being employed. The building cost £3,000, and is dedicated to the Immaculate Conception.

Denstone, Staffs.—The opening and dedication by the Bishop of Lichfield (Dr. Maclagan) of the new chapel in connection with Chad's College, Denstone, took place on Wednesday. The plan of the chapel consists of an oblong 114ft. 6in. by 38ft. (inside measurement), with a double-storied ante-chapel 15ft. by 38ft. Beyond this oblong chapel proper is the apsidal sanctuary, 37ft. by 22ft. 6in., flanked on either side by towers opening into it and into the body of the chapel. This plan is adopted so as to provide for the boys seated choirwise, with a broad central passage, and at the same time to get a sanctuary of sufficient depth and width and of dignified proportions. The sanctuary is groined in stone, with its vault concentric with the great central arch. The towers are at present only carried up to the ridge of the roof, and are temporarily roofed in. The height of the sanctuary from the apex of the vault inside is 44ft., and the height to the apex of the roof outside is 66ft. The height of the body of the chapel is 35ft. to the cornice outside and inside, and the apex of its roof is the same as that of the sanctuary. The length is divided into five bays by buttresses, and in each bay is a three-light window with geometrical tracery. The roof is of fir and pitch-pine, strongly tied to resist the thrust of the timbers over the single span. The timbers are neither stained nor varnished. An organ gallery opens by three arches into the west end of the chapel, with arches under them between the ante-chapel and the chapel. The whole building is, like the College, faced with carved Alton and Hollington stone, and the inside walls are also faced with this stone. The pavement is of tiles increasing in richness towards the east, and is the gift of Mr. Campbell, of the Campbell Tile Company's Works, in memory of his late father, a former Fellow of the College. The foot-pace steps are of polished Hopton Wood marble; the others are of stone. In the west gallery is the beginning of a large organ by Hill and Son, of London. In the central bay of the apse is the reredos, of which the architectural portion is alone finished. The panel, in which will be inserted a bronze representation of the Crucifixion, by Messrs. Singer, of Frome, is not completed. The framework is of Steetly stone, the super-altar is of alabaster, and above it are panels inlaid with ancient Roman marbles. All this part of the work has been executed by Mr. Earp, of London. The chapel has been erected from the designs of Messrs. R. Herbert Carpenter and B. Inglelow, of London.

Liverpool.—A series of technical laboratories and schools are about to be added to the Liverpool University on Brownlow-hill, by the liberality of Sir A. B. Walker, who has given £17,000 for the purpose. The objects of the school are very wide, including not only civil engineering and mechanical engineering, which are now taught in classes for mechanics, physics, geometry, and designing, but the college will ultimately contain chairs of architecture, mining, surveying, and electricity. For the new schools Mr. Alfred Waterhouse, R.A., who designed the University buildings, is the architect, and, like the existing buildings, the premises will be Gothic in character, and of grey brick and terracotta.

Monkton Wyld Church, Dorset.—The church of St. Andrew has been again enriched by the addition of a sacristy, built on the north side of the old choir vestry. It has a stone altar, after the example of old English sacristies, and will be further enriched with a lavatorium carved in stone, and chests carved in oak to contain the altar frontals, dossals, &c. The whole of the structure is in the Early Decorated period of architecture, harmonising with the church. The sole cost of the sacristy has been borne by the vicar, and presented to the parish as a memorial to commemorate the Jubilee. In addition to this a pulpit has been placed in the church. The base, hexagonal in plan, is of red Mansfield stone, with polished Devonshire marble columns at the angles, from which spring the groined and sculptured Mansfield stone canopy, which supports the superstructure. The pulpit, from the floor over the stone canopy to the top, is in oak, with buttresses, columns, pinnacles, and niches, and projecting crocketed canopies. In the niches stand the figures of four saints sculptured in sycamore wood. The saints are St. Andrew, the patron of the church; St. Cecilia, crowned with roses, bearing the organ, and listening in rapture to the songs of the angelic hosts; St. Mary Magdalene, bearing her costly gift of spikenard; and St. Elizabeth, of Hungary, with a nun's veil and a crown on her head—a fold of her dress holds a cluster of roses, and a beggar boy kneels at her feet, to whom St. Elizabeth is in the act of giving bread. The steps to the pulpit are in red Mansfield stone, and the balustrading and handrail in polished brass. The whole of this work has been executed by Messrs. Luscombe and Son, of Exeter, from the designs of Messrs. Hayward and Son.

Sutton Coldfield.—The new buildings for the Sutton Coldfield Grammar School will be opened to-day (Friday). The buildings, which have been erected by Messrs. Barnsley and Sons, from designs prepared by Mr. J. A. Cossins, consist of a schoolroom, nearly 60ft. long, with three classrooms in close proximity; whilst underneath are a chemical laboratory, with accommodation for sixteen students, dining hall for sixty boys, a lecture room, lavatory, hat and coat room, &c. In the upper floors are several bedrooms, bathrooms, and an infirmary. The buildings face the main street, and are connected on each floor with the headmaster's house. The main part of the building is heated with hot water. There is a recently-prepared cricket field in the rear, and playground and covered shed adjoining the school.

Wimbledon.—The High School for Girls, Mansell-road, Wimbledon, was opened on July 20. The architect is Mr. J. Osborne Smith, A.R.I.B.A., 34, Southampton-street, Strand, W.C., the builders Messrs. Howell and Son, London and Bristol, and the clerk of works Mr. R. Old, of Wimbledon. The building will accommodate 250 pupils. The accommodation consists of ten class-rooms, a laboratory, a studio, a large central hall, rooms for head and assistant mistresses, cloak rooms, dining-room, covered playground, housekeeper's apartments, lavatories, &c.

The streets committee of the Edinburgh Town Council passed on Friday plans and sections of new roads proposed to be made on the Braid estate. The area dealt with extends to 133 acres, and on this it is proposed to build in all some 300 villas and self-contained houses. The roads will join with proposed new streets on Colonel Trotter's estate at Blackford on the east, and with those already formed on Plewlands and Greenbank estates on the west. When completed, they will form new avenues of connection between the Grange and Morningside districts.

Mr. George Waterman, of the firm of G. and J. Waterman, who have for many years carried on business as builders in Watford, died on the 19th inst. at the age of 51.

St. Michael's Church, Mytholmroyd, is about to be restored, enlarged, and reseated, from plans by Messrs. T. H. and F. Healey, of Bradford, Yorks.

On Sunday, the Summer Exhibition of the Royal Institute of Painters in Water Colours, Piccadilly, was open to the members of the Sunday Society from 5 to 7, when the number of visitors was 248.

OUR LITHOGRAPHIC ILLUSTRATIONS.

SELECTIONS FROM THE GROSVENOR GALLERY.

ROSSETTI'S conception of "'Lilith,' Adam's First Wife," has been chosen by the Hon. John Collier for his picture which we are enabled to-day to illustrate from the artist's own sketch. The painter's endeavour to realise the poet's idea—"But she was made like a soft sweet woman"—has no doubt been eminently successful. The background of the picture is intended to represent a sort of ideal landscape set in tropical climes, embracing, as it were, in one the elements of heat, light, and moisture. The plants from the tropics were studied at Kew, and the snake was painted from a gigantic boa constrictor at Liverpool, which was lent the artist by Mr. Cross, the naturalist, whose foreman held the reptile during the "sittings." This was a necessary help, as the snake was 10ft. long and "very lively." Mr. Hugh de T. Glazebrook's scene, "In the Cloister" of a marbled Italian monastery, rich in mosaics and frescoes by Giotto—a souvenir of Assisi—is in striking contrast to the last-named picture. The contemplative monk looking into the peaceful convent gardens, where a cardinal walks book in hand, stands in a fitting posture of repose, which chimes in gracefully with the silence of the garth inclosed by the cloister. The buildings are based upon those of the Campo Santo of St. Francis at Assisi. "A Morning Hymn," by Mr. Reginald Hallward, represents one of the larger designs in illustration of a poem included in a volume of music, verse, and design. "Flowers of Paradise" is to be the title of the work, which will be published in the course of 1888. It may thus be seen from this design that the book aims at a far more elaborate character than previous works by the same artist, and it will likewise be produced on a larger scale. Though chiefly addressed to children, its purpose really will be much wider. The composition of the design is marked by considerable originality of treatment in a decorative style. Mr. A. B. Donaldson's view of Lüneburg is taken from the Kalkberg, an anciently fortified mound of great height overlooking the town. The church in the foreground is dedicated to St. Michael, and contains the burial vault of the Guelf family. Beyond are the interesting churches of St. John and St. Nicholas. The Rathhaus is also shown in the picture. This building is notable on account of its chambers having been decorated by Albert Dürer and other artists. The town of Lüneburg is rich in specimens of quaint Domestic architecture, chiefly in brick, and the trees grouping with the churches combine in furnishing a charming picture. "On the Bure, Norfolk," brings us home again, and we thank Mr. Edward H. Fahey, R.I., for his delightful rendering of so well-known a piece of water. The scene is on the Salhouse Broad, and in the distance is seen behind the wherry the Hospital farm on Wroxham Broad, the headquarters of the artist when he painted his celebrated series of watery pieces from Norfolk. This picture, which is in the Royal Academy Exhibition, graphically illustrates Matthew Arnold's lines—

". . . . Eve lets down her veil,
The white fog creeps from bush to bush about."

THE IMPERIAL INSTITUTE.

WE complete our series of illustrations of this competition this week with three sections of the selected design by Mr. T. E. Colcutt. We are obliged by the remarks of several correspondents about the manner in which our illustrations have been produced. There was really no difficulty about it. The authorities placed all facilities at our disposal, and the competitors as well. We had to photograph the designs *in situ;* but that does not matter where the light is good, as it was at South Kensington. It is only when the light is bad, and it is impossible to reproduce designs properly, that we insist, as usual, on removing competition drawings to our own office.

ROGERSTONE CHURCH, MONMOUTHSHIRE.

THIS country church, from the designs of Mr. T. M. Lockwood, architect, of Chester, is herewith illustrated from drawings now on view at the Royal Academy. The plan of the building is very simple—a nave with one aisle, a chancel and square built tower on the south side, capped by a dwarf spire. The walls are of local stone in random courses, with dressed quoins. The porch is of timber, and the roofs are covered with tiles.

WALSALL SCIENCE AND ART INSTITUTE.

THIS building, illustrated to-day, is being erected on a site fronting to Bridgman-street, Bradford-place, Walsall. The design was selected from drawings submitted in competition by architects from Birmingham, Wolverhampton, and Walsall, after careful consideration by a committee appointed for the purpose of carrying out the buildings, and assisted by an officer from South Kensington. Accommodation will be provided for the art department on the ground floor, with ample cloak rooms, lavatories, &c.; and for the science department, consisting of class and lecture rooms, and chemical laboratory, &c., on the mezzanine and first floors. Accommodation is also made on the first floor for a caretaker, and ample cellarage is provided in the basement, with a room for metallurgical research. The exterior of the buildings will be in best red brickwork with warm buff-coloured terracotta dressings. The interior will be faced principally with picked common bricks relieved with moulded brick strings, cornices, &c.; the woodwork will be stained and varnished. The halls and corridors will be fireproof, and laid in simple patterns of tiles. The staircase will be Hawksley's patent. The cost of the buildings, including fittings, will be about £4,000. The architects are Messrs. J. G. Dunn, A.R.I.B.A., and F. W. Hipkiss, of 44, Waterloo-street, Birmingham; and the builders are Messrs. Barker and Son, of Villa-road, Handsworth, Birmingham.

SIMONSTONE HALL.

THIS country residence is a nobleman's shooting-box, and the architects are Messrs. Carpenter and Ingelow, of Regent-street. The present new work has been built on to the walls of an old house which is incorporated with the enlarged hall. The hatched sectional plan shows the old, and the blacked-in parts the new buildings.

A new steam laundry at the County Hotel, Carlisle, was opened last week. It has been built from designs by Mr. T. Taylor Scott, of Carlisle, by Messrs. Johnstone Bros., of the same city, and has been fitted up by Messrs. Bradford and Co., Manchester and London.

The restoration of the 15th-century screen in Plymstock Church, Devon, is approaching completion. Mr. Harry Hems, of Exeter, is carrying out the work from drawings by, and under the superintendence of, Mr. R. Medley Fulford, of the same city.

AT THE SALE ROOMS.

THE sheet of sketches we illustrate to-day was taken from various objects in the sale that lately took place at Messrs. Wright and Mansfield's premises, New Bond-street. The charming old Breton Bedstead, shown at the top of sheet, is a quaint example from a country where nearly everything is done in a sleepy, Mediæval sort of way—a circumstance which induced the late lamented Randolph Caldecott to visit and chronicle in one of his last works the doings of the Bretons. The bedstead is fitted across one end of a room, and is entered by means of the two doors shown. It is not, we should imagine, a very healthy or sanitary piece of furniture; but it quite precludes the possibility of any violent fall or ejectment from within. The little turned balusters almost remind one of Cairene work. The date is shown on the side—viz., 1729—and there is no doubt that every portion of the bedstead was genuine. The little Chippendale Wine-Cooler was a good specimen of that artist's work, well carved, but slightly too roccoco. The Cassone was a good piece of Italian workmanship, elaborately carved, and was originally at Holyrood Palace. The cassone, as most people know, was often used to contain a bride's dowry and attire when she left her father. This example dated from the middle of the 16th century, and was in good condition.

CHIPS.

The energetic Dean of Winchester, Dr. Kitchin, has just carried out a great improvement in the north transept of the Cathedral by removing the lath-and-plaster imitation of stone which blocked up the arches of its triforium, and visitors can now see the Norman work in all its massive simplicity. The restoration of the stonework of the reredos on its southern wing is about to commence; Messrs. Traske will carry out the work under Mr. John D. Sedding.

The Crown Princess of Germany will lay on Tuesday week, the 9th prox., the first stone of the new parish-church for Portsea, which is about to be built from designs by Mr. A. W. Blomfield, M.A.

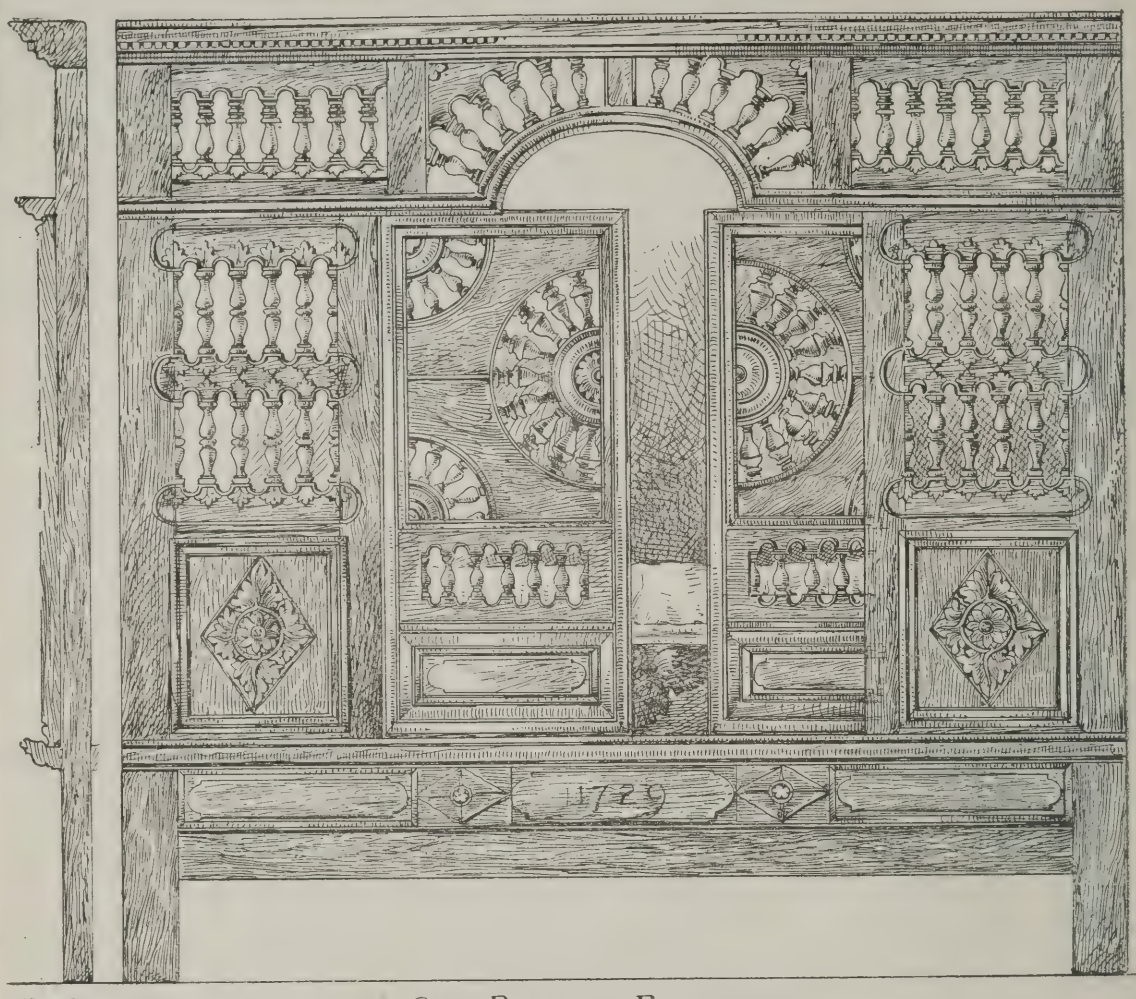
Several memorials have been discovered at Dewsbury parish church in the course of the removal of some of the earth in the old chancel, which is being rebuilt from plans by Mr. A. E. Street. The discoveries include a stone with three brasses—two to former vicars; a fourth brass, a memorial of the Rooke family; and, most important of all, a portion of a Saxon cross (possibly a monument to Paulinus, the Roman missionary), on which is sculptured the Virgin and Child, beneath a canopy.

The organ in Christ Church, Tunbridge Wells, was reopened on Wednesday week, after rebuilding on an enlarged scale by Messrs. Bryceson, of London.

The foundation-stone of a new church in Union-place, Aberdeen, for the St. James Episcopal congregation was laid on Friday. The church will accommodate 400 persons, and the cost is about £2,700.

The council of the Sheffield School of Art have elected Mr. Frank Tory to the mastership of the wood-carving class. Mr. Tory has executed among other works in Sheffield the carving at Messrs. Pawson and Brailsford's, the Mappin Art Gallery, the memorial to the late Mr. M. E. Hatfield, and alabaster statuary for the church of St. Ignatius, at Preston, and St. Joseph's, Wath. The examiners at South Kensington have awarded him two silver medals for figures modelled from the antique.

Westhall Hill Manor House, Oxfordshire, is undergoing restoration by Mr. R. Norman Shaw. Mr. Alfred Groves, of Milton-under-Wychwood, is the builder.



The Edinburgh town council have had under consideration the alterations of the selected plans for the proposed building at George IV. Bridge, and made by their architect, Mr. G. Washington Browne, after consultation with Mr. Waterhouse, R.A., and have finally approved of the plans as revised.

The Hampstead Vestry have voted a contribution of £20,000, and St. Pancras Vestry one of £30,000, towards the purchase of lands for the extension of Hampstead Heath, under the provisions of the local Act of last year.

The Local Government Board have, upon the report of Major Hector Tulloch, given their sanction to the Eccles Local Board borrowing the sum of £8,396 for works of public sewering and paving and private street improvements in Eccles, Patricroft, and Winton.

LOUIS XVI. FIRE-DOGS.

THE Brass Fire-Dogs illustrated are of chased brass and gilt, and are at the Louvre. The French name is *chenet*. We were assisted in our drawing by a photograph kindly lent us by Mr. Boucneau, of Warren-street, Fitzroy-square.

NOTES ON CONCRETE.*

THE author of this little book on concrete, who has taken the Miller prize of the Institution of Civil Engineers, for an essay on iron cylinder bridge piers, is practically acquainted with the subject, and endeavours to impart his own experience in the constructional use of concrete. Mr. John Newman does not write for the manufacturer or professor, but for the practical engineer, and the sixteen chapters of his book are chiefly devoted to the use of concrete in submerged structures. The composition and chemical properties of Portland cement are therefore scarcely touched upon; but the engineer will find what more directly concerns him—methods of testing, the proportions of sand, gravel, and stone; mixing, damping the aggregates, depositing concrete, expansion and contraction, and precautions against their ill effects; the use of concrete in facing, in arches, lowering plastic concrete and blocks, and the bag system of deposit. Something may be gleaned from the chapters on air-slaking, storing, and testing Portland cement. Testing is of little value, as we have often insisted, unless the conditions are observed closely, the tensile strength depending on so many circumstances. These have been enumerated; a variety of small details is necessary to make the test of value. Even the form of clip for holding the briquette, whether the mould was filled at one operation, whether the briquette is made under the same conditions, amount and quality of water used in mixing, its temperature, and that of the testing-room are matters affecting the test. Mr. Newman prefers, as many do, a moderate tensile strength of about 350lb. per square inch at seven days, and increasing with age to a high tensile strength not afterwards increased. Mr. Mann's experiments are quoted as being the most complete, and those referring to the adhesive strength are most important. "The average cohesive strength of the neat Portland cement tested was after seven days 425lb. per square inch. The average adhesive strength of the same neat Portland cement being 611b. per square inch, and 841b. per square inch after seven and twenty-eight days' immersion respectively. The test pieces to which the Portland cement was attached were sawn, close-grained limestone." These experiments further show that there is no general ratio between the adhesive and cohesive strength; while the cohesive strength remained nearly stationary, the adhesive strength increased. But neat cement tests are not conclusive; the tests should be made after mixture with sand. These show whether the cement is finely ground or not, for "coarsely-ground cement when mixed neat gives a higher tensile strength than fine cement; but when mixed with sand the reverse is the case." Many valuable hints are furnished, to which we cannot refer. Mr. Newman has sifted a great many authorities, and has given us the *résumé* of their suggestions. Referring to depositing concrete in work, the author does not agree with the "tipping" system. He says the concrete should be gently shovelled into position on the level, if possible. Throwing in from a height separates the particles, and induces air holes or bubbles, a conclusion which all must have come to, though the system is a favourite one among contractors, as it saves time and labour. The layers should be gently rammed, which increases the density, and the panning should be done directly the concrete is deposited, and not be long-continued. With regard to expansion and contraction, the author cautions against the use of over-limed or freshly manufactured cement; that which has been air-slaked and stored some time being the best to use. Mr. Harrison Hayter recommends that Portland cement should not be used if it contains more than one per cent. of magnesia, and considers there should be no carbonate of lime in it. To avoid expansion this rule is obvious; the cement also should be ground very fine. The author does not appear to have given any attention to the question of the deleterious effect of sea-water on submerged concrete—a point to which we referred last week, nor to Mr. Harrison Hayter's and M. Lechartier's remarks on the subject, though he points to the great importance of avoiding or stopping up any open joints, cracks, and fissures in submerged concrete works to prevent the penetration of water and air and the consequent compression within the mass of concrete and its destructive action. The importance of an impervious facing is discussed in a separate chapter. Quay and harbour works ought to have a facing of hard concrete. Mr. Bernays, at the Chatham Dockyard extension, faced the dock and retaining walls with 9 to 10in. of such concrete, the proportions being 4 to 1, consisting of 4 parts of broken slag or flint, 2 parts of sharp sand, and 1 part of Portland cement, which is so hard as to resist cutting into. But we must take leave of Mr. Newman's useful guide, which ought to be read by every engineer and architect.

* Notes on Concrete and Works in Concrete. By JOHN NEWMAN, Assoc.Inst.C.E. London: E. and F. N. Spon.

CHIPS.

In our issue of the 15th inst., mentioning the opening of some wards at the hospital in Queen-square, it would have been more correct, we are informed by Mr. Manning, to have said "erected from the designs, and under the superintendence of, Messrs. Manning and Simpson," Mr. Simpson having been in partnership with Mr. Manning during the greater part of the time the building was in progress.

Mr. Hadfield has prepared plans for the new abattoirs which the Duke of Norfolk contemplates erecting in Cricket-road, Sheffield. Preliminary plans have been laid before the health committee of the town council, and met with the general approval of the committee.

New Wesleyan Sunday schools are being built at Wimpson, near Southampson, Mr. Morris being the architect, and Mr. George Inder, jun., the builder. Memorial stones were laid last week.

A granite monument has been erected to the late Principal Tulloch in the new cemetery of St. Andrews, N.B. It is of Aberdeen granite, and, standing about 20ft. high, consists of pedestal and column surmounted by a Maltese cross. The sculptors were Messrs. Macdonald and Co., Aberdeen.

Extensive additions are being made to the paper works of Messrs. Dickinson, at Croxley-green, near Watford, including the erection of a chimney shaft 208ft. in height, which has just been carried to its full altitude. Messrs. Clifford and Gough, of Watford, are the builders.

The board schools at Sholing, near Netley, have just been reopened after enlargement, carried out by Mr. Carden, from plans by Mr. W. H. Mitchell, of Southampton.

Railway construction in the United States still makes rapid progress. In the first six months of the present year 3,750 miles of new main-line track were laid down. This is a larger addition than any other corresponding half-year has witnessed, excepting in 1882, when out of 11,568 miles for the whole year, 5,000 miles were laid down in the first half of the year. The average annual addition for the last twenty years is 5,005 miles; for the last ten years, 6,016; and for the last five years, 6,767 miles. The rate of increase is, therefore, progressive.

UNIVERSITY OF ILLINOIS

Engineering Notes.

BOMBAY.—The extensions of the Prince's Dock are rapidly approaching completion. The water area is a little over twenty-four acres. In shape it is rectangular, and its main dimensions are 1,866ft. by 1,000ft. From the west side three jetties are thrown out, measuring 400 by 230ft., and the quayage measures 9,000ft. A passage connects the old and new docks, measuring 202ft. in length by 64ft. wide and 35ft. deep. The separation will be made by an iron ship-shape caisson, built by Messrs. J. and G. Rennie, of London. The entrance to the new works is 80ft. wide, the depth being 32ft. The walls are constructed of local basalt, but the sill stones and coigns are of granite, and have been imported ready dressed from Cornwall. Two of these, the heel pieces for the gates, are each not less than 14 tons in weight. It is expected that Messrs. Kirby and Co., the contractors, will have finished in another six months. The sheds are to be constructed of iron columns composed of old rails, with iron roofs. The hydraulic engines, the cranes, gates, bridges, caisson, pipes, and all iron work are being supplied from Sir W. Armstrong, Mitchell and Co.'s works at Elswick-on-Tyne. The dock was designed by Mr. G. E. Ormiston, Chief Engineer to the Port Trust, his chief assistant, Mr. G.R. Lynn, who had gained experience at the Hull and Barnsley Dock, being resident engineer.

DIEPPE.—The inauguration of the new docks took place on the 17th inst. in the presence of MM. de Hérédier and Dautresne, the Ministers of Public Works and Commerce. The new basin is 1,600ft. long by 300ft. wide, and is entered at present through the Duquesne Dock by a lock. A new entrance is also being made from the outer port, through a tidal basin 490ft. long and 325ft. wide, with locks 69ft. wide, in which the depth of water on the sill will be 32ft. at spring tides. This will enable ships and steamers of heavy draught to enter at all times of the tide. It will take three years before all the works are completed and the warehouses erected on the quays. They are being pushed forward, under the superintendence of the Chief Engineer, M. Alexandre, and his assistant, M. Gerardin.

The Bishop of Ripon re-consecrated St. Stephen's Church, West Bowling, Bradford, which, built in 1860, has just been enlarged by the addition of north and south transepts, an organ-chamber and vestry, and lengthening at the east end by 21ft. One hundred additional seats have been provided. A new memorial reredos is in Caen stone, and is divided by red marble pillars into five panels, which are filled in with devices in alabaster, there being a cross in the centre panel. A stained-glass window of two lights has been inserted in the chancel wall, and contains a representation of the Crucifixion and the Ascension. The work is by Messrs. Powell, of Leeds. Mr. M. Brayshawe was the architect for the work, which has cost £1,400.

The City Court of Common Council considered at a recent meeting alternative designs in Gothic and Italian styles respectively for a new City of London Court, prepared by Mr. Andrew Murray, their acting architect. By a majority of votes it was decided to adopt the Gothic plan, it being in harmony with the Guildhall library and council chamber. The court will be erected on the site of No. 84, Basinghall-street, and will cost as a whole about £202,000; but the first section, with which it is proposed to proceed at once, is estimated to involve an expense of £22,000. At the same meeting a report was received from a committee recommending that in place of a City architect a City surveyor and clerk of works should be appointed at a salary of £800 a-year.

The foundation stone was laid last week of a campanile, which is being added to St. Augustine's R.C. Church, Tunbridge Wells. The tower is of local stone, and will rise to a height of 65ft. Under the church class-rooms for 270 children are being formed in the basement, hitherto unutilised. Mr. Brett A. Elphicke, of Tunbridge Wells, is the architect, and Mr. Jarvis the contractor for both works.

The building of the French cathedral at Pekin has been begun, and the carpenters and masons are now at work. Several objects of antiquarian interest were found in digging the foundations, including war instruments, porcelain, and varnish of the Ming period. The relics have been handed over to the authorities for preservation.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BIRMINGHAM AND MIDLAND INSTITUTE.—The members of the archæological section of this institute, who, it will be remembered, visited London last summer, took part this week in an excursion to York, Ripon, and Fountains Abbey. The party were to leave Birmingham yesterday (Thursday) afternoon for York, where they will take up their quarters at the Royal Station Hotel in that city. This (Friday) morning the train will be taken to Ripon, where the cathedral will occupy the visitors till luncheon. The afternoon will be spent (by permission of the Marquis of Ripon) in the charming pleasure grounds of Studley Royal, in which are situated the ruins of Fountains Abbey. Returning to York for the night, the whole of to-morrow will probably be found none too long for an inspection of the Minster and St. Mary's ruins, the churches, walls, and other antiquities. A saloon carriage will be provided by the Midland Railway Company, and the return train is due at Birmingham shortly after ten o'clock on Saturday night. The excursion promises to be one of the most enjoyable and useful of those planned by the committee.

KENT ARCHÆOLOGICAL SOCIETY. — The thirtieth annual meeting of this society was held on Tuesday and Wednesday last, Tonbridge being selected as the headquarters. At the business meeting held on Tuesday Canon Scott Robertson, the hon. secretary, read the report, which stated that 63 new members had been elected during the year, and that the financial condition of the society was satisfactory. The members then visited Tonbridge Castle, under the conduct of Mr. J. A. Wadmore, and afterwards proceeded to Penshurst Place, all the private apartments in which had been thrown open for inspection by Lord de L'Isle and Dudley. About a hundred members and visitors dined together in the Public Hall, Tonbridge, the chair being occupied by Mr. R. Furly, F.S.A., of Ashford, and an evening meeting was held in the new Science and Art Schools, when Mr. J. F. Wadmore read a paper on "The Smythes of Westenhanger." Mr. G. Payne, F.S.A., described some "Recent Archæological Discoveries in Kent," saying that the site at Plaxton, near Ightham, was about to be opened in continuation of the excavations made in 1859 by Major Luard; and Canon Scott Robertson gave an address on "Tonbridge and its Connection with English History." On Thursday an excursion was made to Brenchley, where the 13th-century church, restored by Mr. Joseph Clarke, the parsonage house, and the Elizabethan houses in the village were seen, and also to Horsmonden Church, Scotney Castle, and the ruins and modern house at Bayham Abbey.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—A special business meeting of this body was held on Friday to consider the recent communications made by Messrs. Kelly and Birchall with respect to the Higher Grade and other schools. It was decided to ask Mr. Edward Birchall, F.R.I.B.A., to resign his membership of the society, on the ground that his firm's proposals were detrimental to the interests of the profession.

LINCOLN AND NOTTS ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY. — This society, which covers the same ground as the old Lincolnshire Diocesan Architectural Society, held its annual meeting on Tuesday and Wednesday week at Nottingham. After a special service at St. Mary's Church, the Bishop of Nottingham (Dr. Trollope) delivered an address on the many architectural and historical facts connected with the building. The members were afterwards received at the Castle Museum and Art Gallery by the curator (Mr. G. H. Wallis, F.S.A.), a descriptive lecture being given by Mr. F. C. Hine, F.S.A. Subsequently, parts of the castle were inspected, and in the afternoon an excursion took place to Wollaton Hall, a description of this fine specimen of Elizabethan architecture being given by the Bishop Suffragan of Nottingham. The annual public dinner of the society was held in the evening at the George Hotel, and at night, under the presidency of Dr. Trollope, a public meeting was held at the Exchange Hall, when papers were read by Mr. G. H. Wallis, F.S.A., and Mr. W. H. Stevenson, the former giving an account of the discovery of the Temple of Diana Nemorensis by Sir J. Savile Lumley, and the latter a history of ancient Nottingham. On the following day the society visited Bakewell Church and Haddon Hall, and in the evening the Mayor of Nottingham entertained the members to a soirée at the castle.

SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY.—The annual meeting of this society was held on Tuesday and Wednesday in Bristol, a district north of the Avon being visited during the excursions. The opening meeting was held on Tuesday in University College, the Mayor of Bristol in the chair. The annual report showed that the society had increased in numbers from 520 to 525, and that the state of the finances was sounder. The society had succeeded in preserving the old Grammar School at Taunton, which had been acquired by the corporation of that town to be reserved for municipal purposes, with a guarantee that the ancient features of the building shall be preserved. The Mayor having given an address on the progress of Bristol, the members inspected the civic plate and records at the Council House, and afterwards visited St. Mary Redcliff Church, Mr. W. E. Jones, assistant city architect, acting as guide. Canyng's House, the Temple Church, and the crypt of St. Nicholas' Church were afterwards visited. In the evening, Professor Lloyd Morgan read a paper on "The Stones of Stanton Drew," and Prebendary Scarth another on "Recent Discoveries in Bath." On Wednesday, the members of the society made an extended excursion through Bristol, and they also inspected the lines of fortifications at Brandon Hall (under the guidance of Colonel Bramble), the Mayor's Chapel, the Cathedral, the Law Library, St. Peter's Church, Norton's House, the Dominican Friary, and St. James's Church.

CHIPS.

A new set of stable buildings is in course of erection at Bruem Abbey for Mr. Cecil Samuda. Mr. Alfred Groves, of Milton-under-Wychwood, is the contractor.

The town council of Wolverhampton have decided to adopt the scheme of the borough surveyor, Mr. Berrington, for the sewerage works and the separation of rainfall from sewage, subject to the approval of Sir Joseph W. Bazalgette. The estimated cost of the works is £8,000 for the separation scheme, and £17,000 for new outfall sewers.

The trustees of Lord Conyers have decided to spend about £500 in the better preservation of the ruins of Conisborough Castle, including the repair of the approach to the summit of the keep and the erection of a lodge on the castle grounds. Mr. Johnson, of Doncaster, is the architect for the works.

Barnstaple is an exception to the rule that a prophet hath honour save in his own country, for the town council have adopted a contrivance for excluding the tidal water from the sewers, patented by a fellow-townsman, Mr. Giles Carter, of Joy-street, Barnstaple.

A mission church is about to be erected at Lower Caversham, Reading. The walls are to be of flint rubble, with freestone quoins and dressings, and faced internally with brick. The contract has been let to Messrs. Wheeler Brothers, of Reading. The architects are Messrs. G. Fitzwilliam and E. P. Warren, of 5, Staple Inn.

A new grammar school is about to be built at Abergavenny, Mon., as a Jubilee memorial. The buildings will be erected in sections, the first of which will cost nearly £4,000. Mr. E. A. Johnson, of Abergavenny and Newport, Mon., is the architect.

Mr. Alfred Groves, builder, of Milton-under-Wychwood, has just completed the restoration of the north and south transepts and Burgess aisle of Burford Church, Oxon, under the superintendence of Mr. J. D. Sedding, architect, London.

A new residence, with stables and lodge, has been completed at Ramsden, Oxon, for Captain Wynter. Mr. H. J. Tollit, Oxford, is the architect; and Mr. Alfred Groves, Milton-under-Wychwood, the builder.

Acting under the advice and upon the recommendations of their architect, Mr. Arthur Loader, of Brighton, the trustees of the Catholic Apostolic Church have decided to have their building re-roofed, restored, and a system of ventilation introduced (Boyles' large extractors being one of the methods). The builder selected is Mr. G. R. Lockyer, of Brighton.

COMPETITIONS.

FORESTRY.—The following awards have been made by the Scottish Arboricultural Society for competitive essays on various departments of Forestry :—Silver medal to George Cadel, for essay on Forest Administration in the Canton Vaud, Switzerland; on the Natural Reproduction by Self-Sowing of Forest Trees—John Smith, surveyor, Romsey, Hampshire, bronze medal; Forestry in Hungary—Major Bailey, Simla, gold medal; Plantations on —— Estate—A. D. Webster, Penrhyn, No. 2 silver medal; Town Planting—A. D. Webster, Penrhyn, bronze medal; Trees and Shrubs suitable for Seaside Planting—A. D. Webster, No. 2 silver medal; Foresters' Cottage, with plan —John Smith, No. 2 silver medal; The Effects of the Great Gales of last 25 Years on Woods and Forests of Britain—John Smith, bronze medal; Report on Woods and Plantations upon the Estate of —— —George Dodds, Wentworth, No. 2 silver medal; Watkin's patent girthing tape—bronze medal to Rider and Son, London; best kind of dead fences for plantations—D. A. Glen, Gartshore, bronze medal. No awards were made for an essay on the abnormal growth of forest trees—the beech knot—or on the hygienic effect of trees and plants. It was reported that on the whole the essays were of more than usual ability.

GREENLAW CHURCH, PAISLEY.—The competitive plans for the Greenlaw Established Church, proposed to be built by the Abbey congregation, were on exhibition last week. The committee received nine sets of plans from Glasgow and Paisley architects. Mr. Sellars, of Messrs. Campbell, Douglas, and Sellars, Glasgow, adjudicated on the merits of the plans, and his award placed the plan by Mr. T. Graham Abercrombie, of High-street, Paisley, with whom is associated Mr. R. S. Symington, head draughtsman in the office of Messrs. John Burnet and Sons, Glasgow, first; that of Mr. Caldwell, of Paisley, second; and that of Mr. Donald, of the same town, third. The committee unanimously agreed to Mr. Sellar's report.

CHIPS.

The number of visitors to the British Museum has sensibly decreased since 1882, when the numbers were 767,402, the number of visitors during last year being 504,891. The visitors to the Natural History department at South Kensington in 1886 numbered 382,742, as opposed to 421,350 in 1885, and 231,284 in 1881, the date of opening.

A portion of Lewis's Building, Ranelagh-street, Liverpool, destroyed by fire on the 24th December last, has now been restored, and was opened on Saturday. The restored premises necessitated the preparation of fresh plans, as the building is now erected on new lines, being as much fireproof as it is possible to secure. Each floor is 1ft. thick, solid concrete, built on firebrick columns, and the iron beams are covered with 3in. of concrete, there being no exposed iron anywhere. The floors are covered in some places with mosaic, some with cement, and others with wood-block flooring. The old buildings have been fitted with automatic sprinklers. The new building measures 140ft. by 65ft. The architect was Mr. W. W. Thomas, of Lord-street, Liverpool; and the builders were Messrs. William Tomkinson and Sons, of Dansic-street, in the same city.

A fatal accident occurred on Friday in the Grand Depot Barracks, Woolwich. The harness-rooms are roofed with asphalte about 6in. in thickness, and a party of workmen in the employ of Messrs. Claridge, Victoria Embankment, have been for some time employed on the repair of the roofs. On Friday they were at work on No. 4 Harness-room, under the direction of a foreman named John Cooper, a man nearly seventy years of age, when, without any warning, the roof fell in. Cooper was killed, and four other men, named Stovell, Hughes, Jefferies, and Harvey, were injured.

The east window of St. Mark's Church, Deptford, is being filled with stained-glass, representing "Christ Disputing with the Doctors." Mr. A. Taylor, of Berner's-street, W., is the artist.

On Saturday, at the invitation of Mr. G. G. Hoskins, of Darlington, President of the Northern Architectural Association, and architect of the new Town Hall and Municipal Buildings at Middlesborough, the members of the association and their friends inspected that group of buildings, which will cost about £100,000. After viewing the town hall and offices the company were entertained by Mr. Hoskins to tea at the Corporation Hotel.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

RECEIVED.—J. W. and Co.—C. and Co.—J. H. J.—F. T.—F. B. and Co.—H. Bros. and Co.—T. and Co.—F. A. Co.—B. of N.—A. B. of G.

DRAWINGS RECEIVED.—"Lawton," "Vitruvius," "Aspirant," "En Avant," "Stag," "Omega," "Alley N.," "Try Again."

Correspondence.

HINTS TO CONTRIBUTORS OF ILLUSTRATIONS.

To the Editor of the BUILDING NEWS.

SIR,—A word to your contributors. Is it not possible to give in the case of each illustration of modern work the cost of erection? Also, a ground plan at least of the building? Might I also suggest that in the case of a building which relies more for its effect upon a general arrangement and massing than upon minute and delicate detail, the idea of your "B. N." Designing Club illustrations should be carried out, and a couple of plans, a couple of elevations (or, in case of good internal work, a section and an elevation), and a perspective sketch given?

I throw out these suggestions with all deference; for, of course, every man ought to know how best to "bring his own pigs to market."—I am, &c.,

NORTH COUNTREE.

NEW POST OFFICE, KNUTSFORD.

SIR,—May I call your readers' attention to your illustration of the above, in connection with your illustration, published September 3, 1873, of Mr. Norman Shaw's design for the New Zealand Chambers in Leadenhall-street.

I am the last man to complain of plagiarism from living or dead, and I consider that anyone is fair game who gives his designs and plans to the world, as I may fairly term your readers; but, I also think, as a man uses these advantages, so will he be judged.—I am, &c.,

HALSEY RICARDO.

13, Bedford-square, Bloomsbury, July 27.

ORDNANCE SURVEY.

SIR,—I am pleased that my last letter to you should have received support from "Triangle" and "A Sufferer." I do not suppose that anyone of an unbiased turn of mind would seriously attempt to defend the principle of the Ordnance Survey. If there are any such I should like to hear them "chirp."

But although there be an undoubted wrong, the remedy is rather difficult to find. In my opinion isolated effort is useless: the thing is too deep rooted to be eradicated by a single hand. Were we only combined we might do much; my only fear is that we are not. One must remember that it is only those who enjoy, or have enjoyed, a fair income from land surveying alone who feel where the Ordnance Survey pinches. To appeal to an architect pure and simple, or a civil engineer, I have found to be useless; they either cannot or will not see the injustice. Let the same principle be applied to *their* especial branch, and then—hey, presto!—that would be a horse of an entirely different colour. Nothing like an *argumentum ad pecuniam*, Mr. Editor, for rousing folks sympathies.

We cannot hope, I suppose, to get the present plates which are in use broken up, and the sale of copies stopped; but we might arrest the further progress of the plundering scheme. "Triangle's" petitioning scheme is all very well, but unless it is most strongly backed up it will be useless. I doubt very much whether some of our M.P.'s would present petitions: we have been contented to sit down so quietly and so long under this flagrant injustice, and to have our daily bread stolen out of our mouths so meekly, that doubts of our sanity will be raised in the minds of most folk, I am afraid.

Will some of our Bill-promoting friends not give us a lift?—I am, &c.,

SURVEYOR.

A NATIONAL INSTITUTE OF BRITISH BUILDERS.

SIR,—Would you kindly allow me very briefly to suggest the inauguration of the National Institute of British Builders as an appropriate memorial of the Jubilee year?—I am, &c.,

AUGUSTUS J. HARVEY.

12, Landridge-road, Fulham, July 26.

THE EFFECT OF SEA WATER ON CONCRETE.

SIR,—The account of the changes produced upon cement concrete in the graving dock of Aberdeen Harbour is another link in the chain of evidence which ought to tend to force the truth upon the minds of those engineers and architects who, in spite of the evidence of chemists, will persist in maintaining that Portland cement is an enduring substance under all circumstances of exposure to the action of either fresh or sea water.

The truth is, Portland cement is a material highly susceptible of pseudo-morphic changes, which may either be for the worse or the better.

For instance, take the silicate of lime crystals for examination, commonly called the insoluble silicate of lime, of which Portland cement is largely composed. Alkaline carbonates decompose insoluble silicate of lime. Now, in sea water it is computed there is in every 10,000 parts 0·165 parts of carbonate of magnesia. Hence if sea water be passed through the pores of concrete or sand, held together with Portland cement, the silicate of lime is decomposed, carbonate of lime is formed and also silicate of magnesia. The unfortunate part of this change is that the volumes of silicate of magnesia and silicate of lime are unequal, so that this pseudo-morphic change, instead of turning out to be beneficial, disintegrates the concrete into stucco. What has taken place at Aberdeen must inevitably be in progress in all those cases where percolation of sea water is acting on Portland cement; but the amount of disruption must be contingent upon the rate and quantity of material acted upon.—I am, &c.,

Parkstone, Dorset, July 22. A. C. P.

THE DOME.

SIR,—I do not want to go into matters of architectural taste, as I profess only to be a practical man, but kindly allow me to say that in your leader of the 8th inst. on the rival features of architecture I look in vain for anything about that most noble feature the dome, and the larger the more grand; if only a cupola it is worthy of being included in the features.

I hope that the subject is to be continued, as

there is next to nothing said about the tower, nor in the "B. N." of the 15th inst.

I do not recollect seeing domes treated upon in any of your excellent journals, and just now it would be a welcome subject, especially if favoured by the experienced architect who urged it for the Imperial Institute instead of a tower.

I read in a contemporary there should not be a dome because it would compete with the Albert Hall, and said to be a good reason for the rejection of Messrs. Deane and Sons', or, I suppose, any other, dome.

I consider the Albert Hall to be a roof; that being so, it would only compete with St. Paul's, there being no other in London worth writing about; and, oh! what a pity it seems to—

Yours, &c.,

Broxbourne, July 25. JAS. PULHAM.

THE NUISANCE FROM SEWER VENTILATORS.

SIR,—Mr. W. P. Buchan, in his reply to my letter on the above subject, completely ignores the most vital part of the question—viz., that it was impossible to get any ventilation through a shaft when the air in that portion of the shaft underground was of a colder and heavier gravity to that of the inlet or outlet. The statement was a simple one; but before giving additional proof that this is correct when applied to any shaft, I will briefly answer Mr. Buchan's questions.

1. I did not refer to an "offensive" street grating which had a "brick ventilating pipe" running under the road. In my letter (p. 52, BUILDING NEWS) the word "brick" is not even mentioned. How could a brick channel be termed a pipe?

2. Mr. Buchan's reference to a street sewer grating having a trap is to me unintelligible. When a person speaks of a sewer grating in connection with the ventilation of sewers, he generally means one in the centre of the road. That was my meaning; and it is not customary to place a water-trap between such grating and the sewer.

3. The horizotal portion of the pipe running under the centre of the road was constructed of 6in. stoneware glazed pipes, and the vertical portion of 4in. iron pipe with a cowl on the top. Had the pipe been choked with iron rust, as suggested, it could not have been clear as I stated. The question as to whether iron pipes are coated is not one which seriously affects ventilation, providing they are clear. It is one of friction, and I would advise Mr. Buchan before mentioning it again to test to what extent a column of air is affected by passing through a rusty pipe; but let the two pipes used for testing be of the same dimensions, on the same level, and both columns of air of equal temperature and pressure.

4. It was desired that this ventilating shaft should effectually ventilate the sewer; but it did not do so, not through the faulty construction, but it proved useless for the reasons mentioned.

5. Whether "stack pipes" are to be used more in the future than at present "in sewer ventilation," is a question for your readers to decide; but in discussing it in the future I would beg Mr. Buchan to stick to the points at issue, and not wander into problematical ideas. If shafts give a certain motive power for the ventilation of sewers, let Mr. Buchan prove it by the laws which govern atmospheric pressure, and by the same I will give you other proofs of their uselessness.

The particulars of the shaft mentioned at Tottenham can be better described by Fig. 1. A is the inlet grating, B the outlet, C the horizontal pipe running under the road to shaft of sewer. The temperature at B being 106°, A 110°, and C 63°, it will be seen that the motive power for ventilation would be at B, forcing air down the shaft; but this is prevented by heavier air in pipe C, consequently the power at A and B had not power to move that at C, and no air could pass up or down the pipe.

If we have a steam boiler and make a fire under it, making steam sufficient to give 10lb. pressure to the square inch, we know exactly what motive power can be applied. In the same manner, if we calculate the weight of atmospheric pressure at inlets and outlets, we have a force as certain as that of the steam boiler. Now, in the above instance, the greater force being in pipe C, and exceeding that of B or A, how can shafts be otherwise than useless for ventilation under such conditions?

Fig 2 shows that of a shaft unattached to a sewer, and used for calculating the current introduced from it, and this under the most favourable circumstances. A is the inlet at

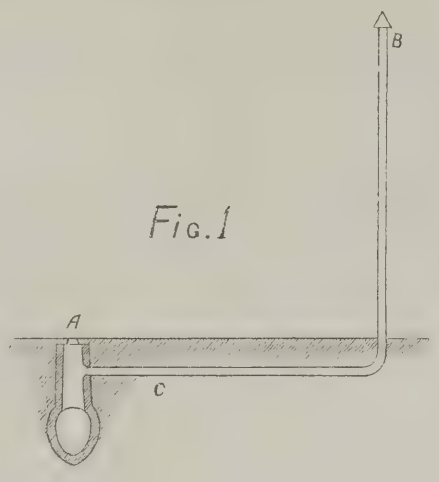

Fig. 1

the level of ground, B the outlet 50ft. high. It is used in this instance to calculate the difference in pressure between points A and B, to arrive at what point is gained by the upcast shaft for ventilation. In this case, 50ft. of

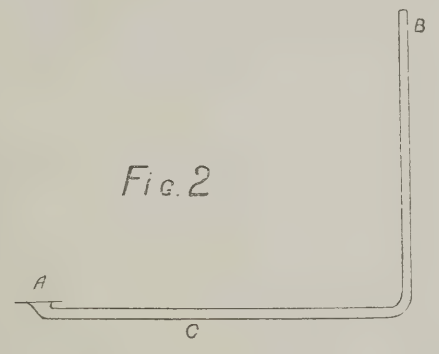

Fig. 2

upcast shaft gives one-twentieth of an inch barometrical pressure on inlet A, or equal to a wind current (deducting friction in bend and tube) of at least ten miles an hour, providing that portion of tube C was not buried in the

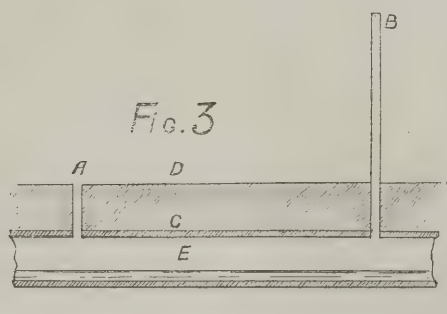

Fig. 3

ground, and the outlet and inlet protected from the influences of eddy winds. Now, at this time of the year, the greater heat being at A, the barometrical pressure is neutralised at this point, for if the air at A be only 4° warmer than at B, the barometrical pressure is lost as a motive power, and the air at B being the heaviest in gravity, it flows down the pipe to mix with air at inlet A in velocity according to the increased heat at A as compared to B, or in the same manner to that of air rushing into a room on the opening of a window.

The air at B, being the heaviest in gravity, becomes the greatest motive power, producing a current down the pipe and out of the inlet A. Consequently in practice, when shafts are erected and the horizontal pipe not plugged with foul air, we have not only the whole of the sewer gas given off at the grating, but an additional current brought down from point B and rendered more or less foul by contact with pipe in its passage, and delivered in the street to increase the nuisance. Thus it will be seen at a glance that as long as the temperature at B is the lowest, the shaft only increases the evil.

Many persons attach great weight to the power (?) of ventilators fixed to the top of pipes with a view of averting the evil. This is an error. Supposing a ventilator were constructed capable of producing a current of 15 miles an hour, and fixed on the top of pipe B. This would add to the pressure at A 1·107lb. per square foot. Add this to the barometrical pressure, and compare it to the power given by the difference of temperature, and it will show the uselessness of either shafts or ventilators when applied to the ventilation of sewers. But the above case only refers to shafts attached to pipes having no water flowing through them; consequently their power is here calculated under the most favourable circumstances.

Fig. 3 will show the working of a shaft when attached to a sewer. In this case the inlet A is still at the ground level, and the outlet B 50ft. high, giving as before 1-20th of an inch barometrical pressure; but that part of the tube C is now formed by the sewer, which is, say, 10ft. below the surface of the ground. At whatever depth the sewer is from the street level, there is always a difference in the weight of air in the sewer to that of the street; therefore the air in sewer forms a mass of heavy gas. The rapidity with which this is removed depends upon the decreased heat at A and B. Thus, when the temperature of A is, say, 50°, B 50°, and E 61°, you have a rush of air up and down the ventilating shaft from A to B, and note that during the months when this is the case sickness is most prevalent. It will be thus seen that the rapidity with which the air is changed in the sewer depends not on the shaft, but on temperature. Thus, if shafts were removed you would have less sewer gas, less friction, and the sewer would be better ventilated. In addition to the above, there are other powers which many times outweigh the difference of temperature or pressure of atmosphere; but with these and the ventilation of house drains I will deal in another letter.—I am, &c.,

R. H. REEVES.

Cedardale, Putney, 18th July.

CHIPS.

The hospital at Beccles, Suffolk, is being renovated, and a new ward added, from plans prepared by Mr. C. Thwaites.

The new church at Ribbleton, Preston, which has been designed by Mr. R. Knill Freeman, of Manchester and Bolton, is about to be commenced. It will, when completed, contain about 350 sittings, and cost about £5,000.

The Corporation of Canterbury elected on Thursday Mr. Baker as city surveyor, in succession to the late Mr. J. G. Hall. Mr. Baker has been for nearly three years assistant borough surveyor of Leicester, and was formerly chief assistant engineer at Sheffield Waterworks.

A new organ, built by Messrs. Peter Conacher and Co., of Huddersfield, was opened on Wednesday week at the Congregational Church, Folkestone.

The new graving dock which has been for some time under consideration at Esquimalt, Victoria, British Columbia, was successfully opened on Saturday. The dock is of sufficient dimensions to dock most of the ships of H.M.'s navy. The caisson at the entrance is one of Mr. Kinipple's patented travelling and folding bridge caissons, which dispenses with the usual swing bridges, dock gates, and machinery for dock entrances. The works were designed and have been carried out by Mr. W. R. Kinipple, of Westminster, as chief engineer, Mr. W. Bennett acting as resident engineer.

The memorial stone of the parish schools of St. Michael and All Angels, Howe Bridge, Atherton, was laid on Saturday. The accommodation is for 450 children. The schools have been designed by Mr. Medland Taylor, of Manchester, and the work is being carried out under his superintendence by Mr. Holmes, of Wigan.

Memorial stones of a new Wesleyan chapel were laid at Horbury Junction, near Leeds, on Saturday. The chapel will be Early Decorated in style, will be built of stone with pitch-pine fittings, and will seat 260 persons.

Intercommunication.

QUESTIONS.

[9352.]—**Rainproof Colour Wash.**—Can Mr. William A. Gross, who replied to this question in the "B. N." of the 13th May last, or any of your readers, inform me where to get Morse's calcarium?—L.

[9353.]—**Land Surveying.**—Owing to a disputed charge, I should be glad of a reply to the following. What is a fair charge for surveying 3½ acres of land which, on account of its nature, took nine hours to measure, being obstructed and in long strips, and also calculating contents, making plan and two tracings?—JUVENIS.

[9354.]—**Gothic.**—I am desirous of studying Gothic architecture. Will any reader of the "B. N." kindly state from experience, in studying the same subject, what are the best books for learning same? For mouldings, is Paley's "Gothic Mouldings" to be relied upon?—STUDENT.

[9355.]—**Vanishing Point.**—Will some kind reader oblige me with the information as to whether there is any way of obtaining the inclination of lines that give the vanishing point in perspective views without having to draw every line to the V.P. itself? And if there is a way of obtaining such inclined lines, how will they (the vanishing lines) be measured for intermediate distances? Accept thanks in anticipation of reply.—S. E. C.

[9356.]—**Wood Staining.**—Which is the best way to stain and varnish deal church seats an oak colour? Considering both durability and appearance, would oil or water stain be best? What would be the requisite number of coats, and the order of their application in each case? I have specified some work (church seats) to be stained first with water-stain, and then twice sized, and afterwards twice varnished; but contractor proposes to size work first, then to stain with oil-stain, then size again, and afterwards twice varnish, which he says would be a better way.—YOUNG ARCHITECT.

[9357.]—**St. Paul's Cloisters.**—I shall feel obliged if some correspondent will give me the measurements—length and breadth in feet—of the cloisters at St. Paul's Cathedral, rediscovered by Mr. F. C. Penrose in 1878. I can find no particulars in Mr. Penrose's interesting paper on the cathedral, read before the R.I.B.A. in that year, nor in any of the late Rev. Mackenzie Walcott's papers, contributed to the BUILDING NEWS or separately published.—EAST ANGLIAN.

REPLIES.

[9310.]—**Half-Timbered Walls.**—I do not think this question has been correctly answered yet. The replies of Mr. Rumble and Mr. Thorneloe have thrown very little light on the subject. My experience teaches me, and I have been building half-timbered houses for the past 20 years, that brickwork is the best material for filling in, whether intended to show as brick panels, or plastered or tile hung. A brick wall is the same, whether it rises from a concrete foundation or whether it is built in the panels of a half-timbered house, and the damp is as likely to penetrate one as the other. If the panels are to be plastered, rake the joints of the brickwork and render with good Portland cement and sharp sand, and if you like the effect, "pebble dash" it. If on the other hand it is intended to "tile-hang" the panels (rather an unusual thing for panels), build in fixing pieces about 2ft apart, about 2in thick, 4½in wide, and about a foot or 15in. long. These "fixing pieces" may be placed upright in the brick panels and flush with them. On to these pieces nail the tile laths, and on these latter nail the tiles As regards the part of the question referring to thickness of timbers, I must confess I do not like Mr. Rumble's mode of doing it: it certainly is not "construction." My conception of a half-timbered building is one in which the timbers are framed together in so substantial and "workmanlike" a way that the whole fabric would stand, and the roof could be put on without the aid of any kind of filling-in. To effect this the timbers should be of scantlings somewhat as follows:—Heads, 11in by 6in.; sills, 11in. by 9in.; angle uprights, 9in. by 9in.; other uprights, braces, &c., 7in. by 6in. Of course, these sizes are meant simply to illustrate my idea of half-timbered construction, and the sizes would in execution vary to suit architectural requirements. With "half-timbering" put together with "stuff" as above, the filling-in of the panels is usually of brickwork 4½in. thick, set back 1½in. from face of timbers; or, in other words, the inside face of the filling-in is flush with back of timbers. A 2in. cavity is then formed, and another 4½in. wall (or, if expense is a secondary object, a 9in. wall) is built on the inside of house, the 4½in. filling-in, and the 4½in. inside really forming, with the 2in. cavity, an 11in. hollow wall. I have built several large houses on these principles, and have never heard any complaint about wet striking through.—JACK MORTISE.

[9333.]—**Ventilation and Prevention of Down-draught in Churches.**—It is disappointing to find no further replies in to-day's issue (July 22) upon this subject. The explanations by "Rex" on p. 117, in addition to what he said on p. 40, do not alter my opinion (on p. 74) that the outlet ventilation of the church should be properly rectified as soon as convenient, whatever is done regarding inlet ventilation or heating. If "Rex" is correct that the openings in the false roof are really tightly closed up, the question as to what is the cause of the "down-draughts" is somewhat interesting. Before accepting the explanation given by "Rex" on p. 74, that the cold draughts are caused by the warm air from below rising up and displacing the cold at ceiling, I would like to be quite certain first that there are no other openings in or near ceiling or elsewhere by which cold air can blow in. If it is not cold air blowing in from somewhere, then we seem to be shut up to some such explanation as that given by "Rex," or that cold air in contact with a cold ceiling and windows produces the bad effect complained of.—W. P. BUCHAN.

[9346.]—**Green Timber.**—Timber of all kinds varies considerably in weight, and this is accounted for in a measure by the nature of the soil upon which it is grown. It is estimated that the average weights of English oak, ash, beech, and elm, after drying in the air from ten to twelve months, during which time they have lost 25 to 35 per cent. of their original weight, are, respectively, 45, 45 to 50, 43 to 53, and 35 to 50 pounds per cubic foot.—THOMAS POTTER.

[9349.]—**Concrete Floors.**—Lieut.-Col. Seddon, some years since, made a large number of tests of the strength of concrete floors, and with extraordinary results. A description of these and other experiments, with diagrams, may be found in the *Building World* for 1884.—THOMAS POTTER.

[9350.]—**Cheap Iron Roofs.**—"Examples of Iron Roofs," by Thomas Timmens, to be had of Batsford, 52, High Holborn, price 12s. 6d., will give the information "Perry" requires.—THOMAS POTTER.

CHIPS.

Messrs. Singer and Sons, of Frome, have designed and executed a mural brass monument for the chancel of St. Matthew's Church, Kingsdown, Bristol, as a memorial to the late J. B. Clifford, M.A. It is in bronze, the emblems of the Four Evangelists being at the corners, and the background being blue enamel. The border of the brass is of 15th-century design, with texts introduced as a part of the ornament.

The Duchess of Albany was present on Monday at Marlborough College, at the dedication of windows in the new chapel as memorials of the Duke of Albany, Dean Stanley, the third Marquess of Ailesbury, Bishop Hamilton of Salisbury, Mr. Robert Few, and Mr. F. Alleyn M'Geachy.

All Saints' Church, Leek, Staffordshire, which has been built from plans by Mr. R. Norman Shaw, R.A., was consecrated on Monday by the Bishop of Lichfield. The church seats 750 persons, and cost £9,000.

In 1872 there were only 2,069 works of art exhibited at the Salon, of which 1,530 were pictures proper, and 334 sculptures and medals, whereas this year of a total of 5,318, 3,563 were pictures, and 1,092 sculptures and medals. The highest numbers of works exhibited in the Champs Elysées of recent years were in 1880, when the total was 7,259, comprising 5,042 pictures and 731 sculptures and medals. The grand total of works of all kinds exhibited in the Salons since 1872 is 74,408, including 54,147 pictures. It is calculated that they would cover 150,000 *mètres carrés*.

An oak pulpit, designed and carved by Mr. Kendall, of Warwick, at a cost of over £120, has been added to the chapel of Malvern College, and was used for the first time on Sunday.

New public brine and fresh-water baths at Winsford, designed by Mr. Phipps, and erected at the cost of Messrs. Verdin, were opened by Lord Cross on Wednesday week.

Among the receiving orders in bankruptcy announced in Tuesday's *London Gazette* is that of Charles James Chirney Pawley, Moorgate-street and Sydenham, architect and surveyor.

The Sheriff of Newcastle-on-Tyne formally opened on Monday a new Victoria Jubilee Board School, which is situated in Urwin-road, Byker, Newcastle. The building is in the Tudor style, and has been built from designs by Mr. Robert J. Thompson, the contractor for the work being Mr. Taylor, of Benfieldside. On the ground floor there are infant school, two classrooms, a committee room, hat and cloak room, and offices. On the first floor there are a mixed schoolroom and six classrooms. There is accommodation for 1,000 children. The total cost is estimated at £7,760.

Thursday, November 3, has been fixed for the consecration of Truro Cathedral. The Prince of Wales, who laid the foundation stone of the cathedral, will be present at the ceremony, which will, it is expected, be performed by the Archbishop of Canterbury.

The British exhibitors at the Adelaide Jubilee Exhibition presented to Sir Herbert Sandford on Monday the oil painting, "The Old, Old Story," by Frith, in token of their appreciation of his services in their behalf.

New board schools for 350 children are about to be built at the new steam-packet station at Parkeston, in Harwich Harbour. Mr. H. A. Worste Reeves, of London, is the architect.

For the erection of the new Hartley Memorial wing at the Sunderland infirmary, of which Mr. J. Eltringham, of that town, is the architect, the tender of Messrs. G. and H. Hildrey, Grange Yard Works, Sunderland, has been accepted at £9,999.

On Saturday last the chancel of St. Philip's Church, Camberwell, was reopened, after restoration and decoration, from the designs, and under the superintendence, of Mr. H. P. Burke-Downing, architect. The figure subjects have all been painted by hand, and the general tone of colour adopted is most satisfactory. Under the north chancel arch some interesting 13th-century work has been introduced, copied in *fac-simile* by the architect from a now desecrated portion of a church of this period.

STATUES, MEMORIALS, &c.

BATH.—A Jubilee bust of her Majesty has been placed in a niche at the new Pump-room, with the inscription beneath, "Victoria D.G. Brit: Reg: Imp: F.D. MDCCCLXXXVII.," the gift of Major Davis, city architect. It has been executed by Mr. R. L. Boulton, sculptor, of Cheltenham. The carvings on the same building were also executed under the care of the same sculptor, by orders of the architect, and amongst them are the restoration of the bronze head of Minerva (preserved in the institution), with the addition of a laurel wreath which it is believed crowned the head. Near this is the head of Hygeia, and another of Minerva as ordinarily represented. The carved consoles represent emblematically the winds as they were idealised by the Greeks, heads emblematical of the Creation, Divisions of the Earth, and Seasons. These consoles are thus intended to represent allegorically the universal benefit of the waters to mankind.

KINGHORN, N.B.—The memorial of King Alexander III. was unveiled, and the new public park opened, by the Earl of Elgin on Tuesday week. The memorial, which has been erected at a cost of £300, takes the form of a shaft over 11ft. in height, slightly tapered square on plan, each face being about 21in. broad. Upon each angle is a roll moulding, treated as minor attached shafts, with moulded capitals and bases, while midway in the height is a moulded band. The shaft is set upon two tiers of pedestals, the lower of which is 4ft. 6in. square on plan, the whole rising from a moulded and splayed base course. The main front of the pedestal is relieved with a slightly recessed panel, on which is the following inscription:—"To the illustrious Alexander III., the last of Scotland's Celtic Kings, who was accidentally killed near this spot, March 19, 1286. Erected on the sexcentenary of his death." A deeply-splayed and moulded intake course divides the lower from the upper pedestal, the latter being also panelled with roll moulding on sides and top, rising from a splayed sill. The front panel is enriched with a bas-relief in bronze by Mr. John Rhind, sculptor, of Edinburgh, representing King Alexander surrounded by his courtiers, hearing the pleadings of some of the peasantry during one of the Circuit Court assemblies. The upper moulding of the panel is stepped in the centre, forming a minor panel above on each side of the pedestal. In each of these minor panels are shields. The top of the shaft is finished with a cornice moulding, and a foliated cross terminates the whole at an altitude of 28ft. above the rock base upon which the memorial is founded. The entire structure is of Peterhead granite, from designs by Mr. Hippolyte J. Blanc, architect, Edinburgh.

CHIPS.

A shocking accident occurred on Tuesday at the works of Messrs. Land and Nettleton, joiners and builders, Dewsbury-road, Ossett. One of the partners, Mr. Joseph Clegg Land, was using a steam boring-machine to bore a number of holes in a 3in. plank, intended for the false bottom of a dye vat. When the bit of the machine pierced the wood, Mr. Land slipped, and he fell forward. The bit instantly entered his body, inflicting fatal injuries before he could be extricated. Mr. Land, who was about 35 years of age, was well known in many of the neighbouring towns, where his firm does an extensive business.

Mr. A. C. Carlyle (late of the Archæological Survey of India) is exhibiting at the Albert Hall a comprehensive collection made by himself, of antiquities, mostly archaic, illustrating the earliest arts of man in the pre-historic Stone age, with other objects pertaining to a later period.

Mr. Broadhurst is asking for a return intended to show that the danger to human life has greatly increased with the increased use of machinery in the joinery trade, and that better methods are needed for protecting workmen in that trade from injury.

Extensive additions are about to be made to the Bethnal-green Workhouse schools at Leytonstone, including large dining-hall, kitchen, and sculleries, baths, stores, workshops, and clothing stores. Messrs. A. and C. Harston are the architects.

The Elephant and Castle horse repository in New Kent-road, S.E., close to Newington Butts, is about to be rebuilt. Messrs. Inkpen and Stallard, of Southsea, Chichester, and Havant, are the architects; and the contract for the first section of the works has been taken at £4,423, by Messrs. W. and F. Croaker, of Hackney.

The local board of Fenton, Staffs, decided on Tuesday to pay the surveyor, Mr. S. A. Goodall, a gratuity of £100 in acknowledgment of extra services in preparing plans and laying out the cemetery, and in carrying out the sewerage of the district.

WATER SUPPLY AND SANITARY MATTERS.

ABBOT'S LANGLEY.—A new system of water supply has just been carried out in this village under the superintendence of Mr. A. F. Phillips, C.E. of St. Albans. A boring was made at Hunton Bridge to a depth of 150ft., with 120ft. of steel tubing, 6in. in diameter, and 30ft. below that depth in the chalk without tubing. Two "Otto" gas-engines were erected, of six horse power each, with two sets of two-throw pumps, capable of delivering 4,000 gals. per hour each. The main water pipe is 5in. in diameter, and about 3,730yds. long. The reservoir is situated near Cecil Lodge, is of brick-work, arched, and covered in. It will contain 7,005 gals. of water, and stands 215ft. above the pumps. For the high service the water is raised 50ft. above the reservoir. At present, one engine is sufficient to do the work, pumping above 15,000 gals. of water per day.

AYR.—The first inspection of Ayr new water-works was made last week by the magistrates and town council of Ayr. Loch Finlas, the source of the new supply, is a mountain tarn, about 800ft. above the level of the sea. It is surrounded by pastoral land. The outlet of the loch is into the Doon, and the council must give compensation to the Doon millowners by sending down the burn daily 250,000 gallons of water. The old water-works, which are still to be maintained, gave a supply daily of about 800,000 gallons of water. By the new scheme, the supply will be from one and a half to two million gallons daily. The water limits embrace a population of 26,000, but the supply is adequate for 10,000 more. From the loch the party drove to Knockjarder, where the filters are placed. These overlook the village of Dalrymple, at a height of 200ft. above sea level. From the filters the water flows into two wells, of 100ft. diameter and 17ft. deep each, and from these into the valve well through pipes of 18in. From Knockjarder to Ayr is a distance of about eight miles; the new pipes are joined to the old ones at Barrhill. The cost of the scheme, which has been carried out under the direction of Mr. Mercer, surveyor to the town council, is about £50,000.

CODNOR AND LOSCOE SEWERAGE.—The Basford guardians proposed to carry out a system of sewerage and sewage disposal for this parish, which is in their union; but the scheme has met with opposition from the parishioners, who considered it too expensive, and objected that it did not deal with the whole district. The guardians have therefore, with the consent of the Local Government Board, agreed to delay further proceedings until the parishioners have time to present an alternative scheme for their consideration. The parishioners have requested Mr. W. H. Radford, C.E., of Nottingham, to report whether a more economical plan can be devised, and, if so, to prepare an alternative scheme.

CRAIL WATER WORKS.—This scheme consists in abstracting a portion of the Lochton Burn above Toldrie, and conveying it, by a fireclay pipe 10 inches in diameter and 1,920 yards in length, to filters and a service reservoir to be constructed on the town's land near Ribbonfield. The water of a spring entering the burn about 680 yards from the filters is also to be intercepted and taken into the reservoir. The filters will be two in number, 15 feet by 14 feet, each in area, and capable of passing a supply of 21,000 gallons per day. The service reservoir is to be 30 feet by 14 feet and 10 feet deep, holding 25,425 gallons. It will be covered with a galvanised wrought-iron roof. The medium of filtration is sand, which is laid on in layers—commencing at the top, 18 inches of fine sand, 3 inches of gravel about the size of peas, 3 inches of gravel about the size of hazel nuts, and, finally, ending with 15 inches of broken metal, in which the drain pipes leading away the filtered water to the service reservoir are laid. The main pipe to the town is 4 inches in diameter and 2,100 yards long. There are 1,800 yards of distributing pipes, and a number of street wells will be erected throughout the town. The engineers are Messrs. J. and A. Leslie and Reid, C.E.'s, and the contractor is Mr. R. B. Steuart. The works will be commenced immediately.

LIMPSFIELD AND OXTED WATER COMPANY.—The works of the above company will be opened to-day (Friday). Although the works are small, they are interesting from the fact that the pumping machinery is worked by water power, and is the first of the kind erected in this country. Mr. W. Barns Kinsey, M.Inst.C.E., F.G.S., is the engineer.

THE VYRNWY SCHEME FOR LIVERPOOL.—The town clerk of Liverpool has been authorised by the Water Committee of that city to retain counsel to appear before the arbitrator in the claim of Mr. Hawksley against the Corporation with regard to his services in connection with the Vyrnwy scheme. The appointment of Sir J. W Bazalgette "as the one hydraulic engineer to determine the plans of the works and apparatus for measuring the Vyrnwy compensation water, about which the engineers of the Corporation and the Severn Commissioners have failed to agree," has also been approved by the committee.

LEGAL INTELLIGENCE.

A BOGUS SANITARY PROTECTION ASSOCIATION.—At the Manchester assizes, on Friday, before Mr. Justice Smith, Thomas Smith Bright was charged with having obtained money by false pretences at Preston. In April last the prisoner established himself at Preston. He called on Mr. Wilding, plumber, of Lune-street, and stated that he was engaged in forming a sanitary protection association, and that he was supported by various medical men in the town. The association would have a good deal of plumbers' work to dispose of, and if Mr. Wilding would pay a life subscription of five guineas that work would be given to him. Similar representations were made to another plumber, named Jolly, and in each instance the five guineas were paid. No such association was formed, and the plumbers got no work in return for their five guineas.—Dr. Pilkington, medical officer for Preston, said he consented to join the proposed association, but did not, as was represented, refer the prisoner to any plumbers. It was stated that the prisoner had carried on similar operations at Barrow, Lytham, Warrington, Blackburn, Wigan, and Swansea, and that he had received in the latter towns at least £600, for which no consideration was given. He was found guilty, and the judge, describing him as a pernicious and dangerous member of society, sent him to prison for 15 months with hard labour.

IN RE CHARLES GRIBBLE.—The bankrupt applied to pass his examination before Mr. Registrar Brougham on Friday. He was described as of Vauxhall-cross, importer of doors, mouldings, and trellis-work, lately trading with Arthur W. Peaty, and his unsecured liabilities were returned at £5,153, with assets £3,502. The bankrupt was formerly manager to Messrs. Esdaile and Co., to whom the business formerly belonged, and in February, 1882, having no capital of his own, he agreed to purchase the stock-in-trade for £2,811, Esdaile and Co. continuing to supply goods. Mr. Peaty (Esdaile and Co.) joined him in the business, bringing in £1,000, upon which he was to receive interest and also two-thirds of the profits, but Mr. Peaty stated that he was not a partner. The bankrupt passed his examination without opposition.

IN RE W. LANGLEY AND SON.—The debtors, trading as brick merchants at Plaistow, have filed their petition, and upon the application of Messrs. Thomson and Ward, the usual receiving order was made by Mr. Registrar Hazlitt on Monday. The liabilities are believed to be considerable.

CHIPS.

The old colours of the 38th Regiment, now the 1st Battalion South Staffordshire Regiment, which were carried through the Crimea, Indian Mutiny, and Egypt (1882-5), were on Tuesday deposited in Lichfield Cathedral. The flags were much dilapidated, having been in use for 48 years.

A new public hall is about to be built at Isleworth, from plans by Mr. S. Woodbridge, jun., of Brentford.

A new hotel, to be known as the Creg Malin, has just been opened at Peel, Isle of Man. The external elevations are a departure from the stereotyped stucco met with everywhere in the island. They are faced with Ruabon bricks and cream-coloured bricks, and a new artificial stone similar in colour to the Ruabon bricks is employed for dressings. The oriel windows at each angle of the front portion of the building are carried up above the main roof to form turrets, and have battlemented parapets. Messrs. Mangnall and Littlewoods, of Manchester, were the architects, and the Executors of the late William Gradwell, of Barrow-in-Furness, the contractors.

The Select Committee of the House of Commons on Forestry will report next week. It is understood that the committee are in favour of the establishment of a board of forestry, which should consider how best to utilise existing facilities for instruction in forestry. It is believed also that the committee will recommend that parts of the west coast of Ireland and the highlands of Scotland be extensively planted with trees.

Larbert parish church was reopened on Sunday. An organ has been built by Messrs. Wilkinson and Sons, of Kendal. The whole church has been re-seated and panelled in solid oak by the Bennet Furnishing Co., of London and Glasgow, who have also furnished a carved pulpit and screen for the organ, both in oak, from the designs of Mr. John M'Laren, Larbert. The congregation have expended upwards of £1,700 in carrying out this work.

Our Office Table.

ON Friday last a number of gentlemen assembled at the invitation of Mr. Edward Terry and Mr. Walter Emden, M.S.A., the architect of Mr. Edward Terry's new theatre, fully described on page 161, to witness the special precautions made to prevent the chance of a damaging and dangerous outbreak of fire in the building. A thorough system of hydrants in the best available position will be placed both before and behind the scenes, while the whole of the stage and flies both above and below are dominated also with a system of sprinklers, which are commanded by valves at the stage door. The proceedings on Friday consisted of the extinction of a fire, which was built up on the stage, and allowed to attain considerable proportions before the water arrangements were brought into requisition.

ACCORDING to a writer in *Le Figaro*, the French Government has always been more liberal in the distribution of the Legion of Honour towards painters and architects than to musicians. At the present time the number of members of the several professions in France entitled to wear the riband of the Legion is: Painters, 202; architects, 105; sculptors, 83; musicians, 60; and engravers, 29. Although such "honours" are not worth much, it is noteworthy that art in all its branches is thus far more lavishly recognised by distinction of this kind in France than by our own Government, which even on the occasion of a Jubilee does not find a single architect or other artist whom it delights to honour—possibly because our professional men do not dabble sufficiently often in politics to stir the memories of the wire-pullers who control these distributions.

MR. WILLIAM WOODWARD, in a letter to the *Times*, vigorously attacks Mr. Butterfield's proposal to reduce the width of the portico of St. Martin's-in-the-Fields Church, as a solution of the difficulty of widening the bottle-neck of Charing Cross-road. He says that the lessening of the projection of the portico would destroy the very element of its success, as the eye would thereby be the more easily led to the weighty tower and steeple, which appear to spring directly from the porch roof. He asserts that the ever-increasing traffic at this corner necessitates some setting back of the pavement, and proposes to do away with the church steps altogether, and to erect a podium or continuous plinth under the portico. Mr. E. J. Tarver suggests that a simple remedy would be to narrow the platform midway up the flight of steps to the average width of a step, and so provide an additional line of wheel traffic at the cost of taking up and relaying half a dozen steps. Mr. Butterfield protests against the strong language used by Mr. Woodward, and especially against the charge of "barbarism," adding, with an assumption of ignorance which is amusing if genuine, "I do not know whether Mr. Woodward is an architect. His readiness to leave 'the public to decide' such a question makes me hope that he is not." Having been directly challenged by Mr. Woodward, the Secretary of the Society for the Protection of Ancient Buildings comes forward with a tardy and somewhat tame deprecation of the proposed alterations, proposing instead that the National Gallery railings and steps should be set back.

BY the death on Wednesday week, at the age of 84 years, of Miss Margaret Gillies, A.R.W.S., the oldest of British lady artists has passed away. At the age of 20 Miss Gillies removed from Edinburgh to London, having determined to take the courageous step of becoming a professional artist. Learning her art, and working at the same time, she began to maintain herself by painting portraits in miniature, and for many years contributed to the annual exhibition of the Academy. Among her portraits were those of Wordsworth, Charles Dickens, and Mrs. Marsh. For nearly five-and-thirty years she has been an Associate of the "Old," now the Royal Society of Painters in Water Colours, and in the present exhibition is to be seen the drawing which she intended to be her last work—"Christiana by the River of Life."

THE summer exhibition of the Royal Scottish Academy, just open, is, like the display of last

year, restricted to water-colours, drawings in black and white, etchings, and a few pieces of sculpture. The total number of subjects in the present exhibition is 852, of which the great majority are by Scottish artists. The president, Sir W. Fettes Douglas, exhibits seven drawings in water-colour, and among other artists who exhibit may be mentioned W. E. Lockhart, Sir Noel Paton, Waller Paton, R. Herdman, Gourlay Steell, and John Smart. The best etchings are those by W. B. Hole and Otto Leyde, the latter also showing several full-lengths of children. The works by deceased artists include three English landscapes by Turner, and other drawings by David Cox, Robert Thorburn, G. P. Chalmers, Sam Bough, and E. F. Crawford.

THE electric light has, so far, failed to fulfil its early promise. Meanwhile gas has fairly held its own, and the Welsbach Incandescent Gas-Light comes upon the scene as a powerful auxiliary of the old and familiar illuminant. Many successful installations have been made by the Incandescent Gas-Light Company, amongst which some of the most conspicuous in public places are those at Willis's Rooms, Madame Tussaud's, the Gaiety, Lyceum, and Covent Garden Theatres, the Café Royal, and the Hôtel Continental. Amongst leading West-end clubs, where it is in contemplation to adopt the system, the preliminary installations having given the greatest satisfaction, may be mentioned the Travellers, the United Service, the East India United Service, the Whitehall, the Junior Athenæum, and the Junior Army and Navy. The Welsbach Incandescent Gas-Light has attracted a great deal of attention from the medical profession, not only on account of the beauty and steadiness of the light emitted, equal, with a very small consumption of gas, to a 20-candle incandescent electric lamp, but also on account of the entire absence of the deleterious products of combustion; and by invitation of the Council of the Royal College of Physicians, the light was exhibited at the hall of the college on the occasion of a conversazione held on 29th ult., where it attracted universal admiration. In the *Revue d'Hygiène* of 20th June, Dr. Galezowski, the eminent Parisian oculist, has written an article on various systems of illumination, in which he assigns the highest place to the Welsbach incandescent system of gas-lighting.

MR. JOHN DAWSON, an architect and journalist, makes the practical suggestion, based on personal experiences, that the surface of the walls, floors, and even the ceilings of police and prison cells should be composed of glazed tiles or glazed bricks, set in the best cement. This would allow of little or no lodgment of dust and vermin, and render the daily mopping out of the cells a perfectly easy and effectual process. He further suggests that it would be better if the benches of the cells were not fixtures, so that they could be daily carried into the yard and thoroughly cleansed.

THE Corporation of Liverpool have arranged for the delivery of a course of at least eight lectures on health in the Picton Lecture Hall in that city during the coming autumn, under the auspices of the Corporation. Eight professors of University College, Liverpool, have promised to give a lecture in this course, which will deal with houses, sanitation, drainage, and food. Like all the lectures given by the Corporation in the same hall, they will be free to the public, and are specially intended for the working classes. A good feature of the scheme is that it is intended to publish a *résumé* of each lecture in pamphlet form, to be sold at the smallest possible cost, in all likelihood one halfpenny each, so that the influence of the course may not be confined simply to the audience. The lectures will probably be given in November.

PODMORE'S "Patent Sash-Fastener," which is now being introduced, seeems an effective one, and has one new feature, inasmuch as by turning a screw it tightens up both sashes. The shoot is held back by a stop bolt, which rises when the front sash is lifted or the back sash lowered. The self-acting form is actuated by a spring, about the duration of which we are doubtful. The non-self-actor is of equal use in preventing the rattling of windows through the turning of the thumbscrew. When in working the thumbscrew must be turned back as far as it will go, and the shoot pushed into its case, then a half turn of the screw sends the end of it into a countersink, which holds it in its place. A slight turn of the screw releases the shoot and fastens the window.

IN order to promote efficiency on the part of carpenters, joiners, builders' foremen, and clerks of works, the Worshipful Company of Carpenters propose to hold examinations in their Hall and at their Technical Institute at Stratford, and to grant to candidates certificates of their theoretical and practical acquaintance with their craft. The first examination will take place in June, 1888, and full particulars, with specimen of examination papers, can be obtained at Carpenters' Hall, London Wall, E.C.

THE exhibition of the works submitted in the National competition by the Schools of Art throughout the kingdom was open to the public yesterday (Thursday), in the North Court of the South Kensington Museum, and will remain open until the beginning of September. The free days are Mondays, Tuesdays, and Saturdays. This year about 465 works have been selected for exhibition, being those to which prizes have been awarded, out of nearly 365,000 works sent up from 2,347 schools of art and classes for the annual examination at South Kensington. The subjects of the competition are figure drawing and modelling, painting in oil and water colours, and design, especially as applied to manufactures. The prizes awarded are 7 gold medals, 54 silver medals, 112 bronze medals, and 210 National book prizes. In addition, honorary awards have been made to students in the training class of 5 gold medals, 19 silver medals, 25 bronze medals, and 33 National book prizes. Besides the medals and prizes awarded by the Department of Science and Art, the Princess of Wales gives two scholarships, value £25 and £11 respectively; the Plasterers' Company prizes for designs for plasterers' work, drawn in chalk or pencil, or modelled in plaster; and the Society of Arts the Owen Jones Memorial prizes for designs. The following gentlemen have acted as the examiners:—Mr. E. J. Poynter, R.A.; Mr. G. D. Leslie, R.A.; Mr. W. F. Yeames, R.A.; Mr. H. S. Marks, R.A.; Mr. H. H. Armstead, R.A.; Mr. Hamo Thornycroft, A.R.A.; Prof. George Aitchison, A.R.A., F.R.I.B.A.; Mr. W. Morris, Mr. J. J. Stevenson, Prof. W. C. Unwin, Mr. Walter Crane, Mr. Alan Cole, Mr. Armstrong, Director for Art, and Mr. Bowler, Assistant Director for Art.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Society of Architects. Visit to Terry's new theatre, Savoy-buildings, Strand, conducted by the architect, Walter Emden, M.S.A. 2.30 p.m.

Architectural Association. Visit to the following churches at Streatham:—St. Peter's, G. H. Fellowes Prynne, architect; St. Andrew's, Ernest George and Peto, architects; and St. Alban's, E. H. Martineau, architect. Trains from Victoria to Streatham-hill 2.20 p.m., and from London-bridge at 2.25 p.m.

A new pulpit of marble and alabaster is about to be placed in Harlow parish church, Essex. The designs have been prepared by Mr. C. S. Adye, M.S.A., of Bradford-on-Avon.

The tender of Mr. J. Martin, of Eastbourne, has been accepted at £5,982 for the erection of the proposed new infirmary in that town. Mr. F. G. Cooke, of Eastbourne, is the architect.

A full-length marble statue of the Queen, erected at Reading, was unveiled by the Duke of Cambridge on Wednesday. It has been executed by Mr. George Simmonds, who also designed the monster lion in the Forbury of that town, commemorating the Berkshire heroes who died at Maiwand.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Shop Fitter, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Holloway's Pills.—Nervous Debility.—These Pills are the best regulators and strengtheners of the nerves, and the safest general purifiers. Holloway's Pills are particularly recommended to persons of studious and sedentary habits, who gradually sink into a nervous and debilitated state unless some such restorative be occasionally taken.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

BEST BATH STONE.

FARLEIGH DOWN, CORSHAM DOWN, BOX GROUND, COMBE DOWN, WESTWOOD GROUND. STOKE GROUND.

RANDELL, SAUNDERS, & CO., LD.,
CORSHAM, WILTS.

BATH STONE.

PICTOR'S MONKS' PARK. CORSHAM DOWN. BOX GROUND. FARLEIGH DOWN. COMBE DOWN. STOKE GROUND. WINSLEY GROUND. WESTWOOD

PICTOR and SONS, BOX, WILTS.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries, and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

NORTH'S IRON BUILDINGS,

From National Agricultural and Colonial Exhibitions.

All Sizes, SALE or HIRE; and Sheets; also from Railways, and New Soiled.

IRON CISTERNS, all sizes, cheap.

LONDON ROAD, SOUTHWARK.

WM. OLIVER & SONS,

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ALCOMBE.—For building new dwelling-house. Mr. C. H. Samson, F.R.I.B.A., Taunton, architect:—

Rendell and Son	£2,505	0	0
Verrier	2,450	0	0
Templeman	2,360	0	0
Pittard	2,205	0	0
Langdon, Minehead (accepted) ...	2093	11	0

ALCOMBE.—For building new stables. Mr. C. H. Samson, F.R.I.B.A., Taunton, architect:—

Langdon (accepted)	£353	0	0

ANDOVER.—For mansion and offices, Enham-place, near Andover. Mr. S. Knight, F.R.I.B.A., architect. Quantities supplied by Messrs. Stone and Sons:—

Luscombe and Son, Exeter... ...	£7,800	0	0
Bird, London	7,525	0	0
Estcourt, Gloucester...	7,431	0	0
Grover and Son, Islington... ...	7,088	0	0
Stephens, Bastow, and Co., Bristol*	6,849	0	0
Beale, Andover	6,528	0	0

* Accepted.

AVONMOUTH.—For gasfittings in connection with a shed at Avonmouth, for the Bristol Docks Committee:—

Scull, G., and Co., Clifton	£143	16	0
Williams, A. G., and Co.	112	19	8
Edbrooke, M. L.	109	2	4
Leary, J. S.	106	11	4
Norman, H. G....	94	10	6
Dawson, R., and Co., Stalybridge ...	93	0	0
Parry, J. C.	91	4	6
Chivers and Son, Bedminster ...	87	1	0
Wilkins, R., and Sons...	85	6	6
Harris, T.	81	0	0
Edbrooke, T. and R.	80	0	0
Wilkins, J.	77	10	0
Jones and Hudson	69	14	10
Guernsey, C. E. (accepted)	67	10	7

(Rest of Bristol.)

BERMONDSEY, S.E.—For painting the town hall, for the vestry:—

Harrison and Spooner...	£977	0	0
Batley	948	0	0
Giles and Co.	734	10	0
Baker	673	0	0
Bargeman and Sons	624	0	0
Dudley, W., New Southgate, N.* ...	470	9	5

* Accepted.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1700.

FRIDAY, AUGUST 5, 1887.

THE EMPHASIS OF STRUCTURE.

WHEN reasons are given for disposing materials in particular forms, for distributing windows and piers, for marking horizontal divisions, and for designing certain features and ornamental accessories of buildings, we may conclude that we have reached a stage of national architecture and have passed beyond the reproductive and imitational era. For a long time English architecture has been in the throes of this critical stage. Amateurs and architects have talked themselves dumb about the claims of Greek or Gothic to be considered a truthful exponent of national wants and materials; homilies on falsehood of construction, the morality of art, the terms *pseudo* and *quasi* have been flung by Mediævalist and Classicist against each other reproachfully, and all this controversy and wordy wrangling has ended in a sort of reconciliation of the claims of both kinds of art. A stage has been reached in which both sides have begun to think for themselves, and to admit that each was in fault in not making the essentials of building the primary consideration; in reviling one another for what each was guilty of, and in discovering after all that even the tirade against "shams" and counterfeits may be carried to a ridiculous extent, and would logically lead us to regard the material texture of higher importance than form, and the structural skeleton as the only logical development of architecture. The "muscular" type of architecture has long since lost its hold of the public, in spite of those enthusiasts who maintained that every room and floor ought to be made visible, every step indicated, every joint and nail exhibited in the external architecture. They were on a par with those morbidly inclined painters of the human figure who sought to delineate the bones and muscles, and to give us the ideal of asceticism, rather than natural beauty of the human form divine.

This ultra-structural idea of architecture, however, was a healthful reaction from a weak dilettantism. Too little had been thought of structure, and a great deal too much of mere style. Of late years, architects have learned to observe a happy medium between structure and ornamentation. America, which has been following the steps of the mother country, is already entering upon this stage of development. The materials and structural types of the old land has been long imitated in wood, and even in metal, monumental forms have been copied which were designed for stone and brick, till the *raison d'être* of design was almost lost. A change is rapidly taking place: we now see buildings which vie with those of the old country, an architectural prescience is noticeable, and much of the change is due to the influence of the works of the late Mr. H. H. Richardson, and to other well-known architects of the States. The connection between structure and architecture is one that must force itself upon architects of even that free and practical people, and the Illinois State Association of Architects have made it a topic in a recent symposium. The question proposed was "To what extent is it necessary in design to emphasise the essentially structural elements of a building?" Now, it is obvious the structural elements of buildings vary much — a simple monument or memorial would require only stability and protection against the external forces of the atmosphere—a tower and spire of a church, for instance. A building destined for Divine worship might have less marked structural elements than a factory or a house; in short, these elements would become more prominent in proportion to the simplicity and cheapness of the building. These are obvious truths. To refer to the essays of those who undertook a solution of the question, Mr. William W. Clay, who read the opening paper, dealt with the limitations to be observed in an exposition of truthfulness in construction. Mr. Clay considers first a misrepresentation of materials, and, secondly, a denial of true construction. He endeavours to answer the question, "To what extent, and with a hope of what advantage to itself or us, shall it be permitted to conceal the truth or formulate a falsehood?" When the falsehood is resorted to to avoid penalty and the disadvantages which follow a disclosure, there is nothing to commend it; but, on the other hand, when disguise has been prompted from the benefits to be derived from it, when the end is made to justify the means, the excuse or incentive opens a field at least for discussion. In brief, Mr. Clay holds, upon the ground that falsehood is a freak of selfishness, there is nothing but condemnation for the act; but upon the ground that beauty, however false, becomes an instructor in form and in colour, so that the form and detail are good, the selfishness is turned to sacrifice, and the means are justified. In other words, when an iron girder is hidden or partially concealed to obtain an agreeable form for the eye, the counterfeit is justified; but only so far as the assumed form and detail are expressive of the purpose and otherwise truthful. In general the author observes "that the emphasis placed upon the essentially structural elements of a building should be at least a polite acknowledgment of their several and individual existences." A girder may be hidden altogether from view, or so disguised as to make it appear an arch, or something different to what it is. There is less to be said for the means when the falsehood becomes more deliberate when the endeavour is to misrepresent the real construction to the spectator. The next essayist, Mr. Frederick Baumann, agrees with the doctrine that giving "grace of form and beautiful enrichment to structural elements" is commendable; but he does not believe in the necessity of giving an express emphasis to structure, but rather a harmony between structure and expression. This author classifies buildings according to their uses, and so far appears to discuss the question on a practical basis. He first takes manufacturing buildings. Wealth prompts builders to consider two points, an educational and an advertising one. With buildings of this class there is naturally a tendency to show all and every material in its appropriate mass, form, and colour; everything contrary to constructive use is prohibited. Ornamentation is confined to construction. The "store building," or, as we should say, mercantile class of buildings, are taken next. The logical treatment is still permissible. Office buildings, tenement buildings, houses, &c., allow of a freer and more artistic treatment. The fourth class, or auditory buildings, comprising the foremost and highest order of structures, is one taxing the architect's imagination most severely. The last class includes all residences—the most numerous and varied class; the architect is here free to exercise his powers. The author submits that the architecture of this class ought to hold a connection with the surroundings, as was the case during the 17th and 18th centuries in Great Britain. Urban residences demand stateliness and order; the suburban may be more freely treated; but the country residence is not bound to urban regularity and correspondence, while the landscape calls for consideration in the planning and architecture. It is the broadest field for a gifted architect. The other contributors to this symposium view the question with less regard for structural truth. One of these, C. M. Palmer, says: "Art has to do with the pleasing, the fanciful, the artificial. She delights in mimicry and fictions." The writer clearly is one amongst those who thinks good architecture ought not to take a too serious view of structure, and that the architect should accept the privileges of other artists. He is not called upon to make a skeleton of his creation. Innocent deception may be resorted to according to their ideal.

There will always be two opposite views of art—one, that of giving a license to the imagination and freedom to the fancy; the other, that of curbing it and making the structure of prominent importance—of rendering technical expressions of facts. In landscape painting and, indeed, other kinds of painting and sculpture, artists are found who adopt one or other of these views of the mission of art. There are those who laboriously and patiently render every leaf and tuft, every wrinkle and defect, they believe that the right duty of the painter is to render nature with a microscopical eye. Minuteness and laboured detail are aimed at; others endeavour only to give us the general impressions of nature, they sketch broadly by abstractions of line and colour the natural effects of distance, of texture and colour. So amongst architects, some would give us skeletons of structure, others would clothe the skeleton in the lineaments of beauty or of mere fancy. And, after all said, it is impossible to lay down any strict rule or to draw the line of demarcation between structural and artistic expression. Every building must, and ought to, evolve a law of its own. There must be a law of differentiation to be observed arising out of plan, material, structural arrangement, destination, and cost. It is as decidedly wrong to fall into mere caprice and licence as to express crudely the mere mechanical structure. It is decidedly wrong to mask one material by another in order to make people believe the structure is of marble when it is really of iron; to veneer a girder or beam with slabs of marble or imitational painting with intent to deceive the eye, to make a chimney appear a turret, or to exhibit an arch, when really the weight is carried by a beam, and there is no palpable abutment for the arch. There is no excuse for telling so direct a falsehood; there is a violation of truth in all such expedients. On the other hand, to encase an iron column by concrete, or cement, or faïence in such a manner as to emphasise its office as a support, or to clothe an iron girder in plaster or pottery without an attempt to make it appear something else than it really is, to ceil a timber roof by a plaster vault, to plaster or veneer a rough brick wall, are within the legitimate functions of art, and are sanctioned by everything of beauty in nature.

The upshot of all this is that whenever the attempt is made to conceal with an intent to defraud the eye, or whenever the structure is so falsified that the parts of it deny one another, there is a violation of truth for which there is not the slightest justification or excuse whatever. There are hundreds of things done by builders which cannot be justified by any pretence for the higher sanctions of art; they do not express the structure—they are, in fact, invented to contradict it and bewilder the mind, thinking this the acme of artistic skill. What a miserable delusion and snare! If we do not emphasise, let us never falsify by contradicting that natural expression which is the highest object of the architect's art. Let us improve, clothe, and beautify by every way within our power; but let this be done sympathetically, never in violence of, or contradiction to, the structure, always conscientiously and in harmony with it and the materials employed.

NATIONAL COMPETITION OF SCHOOLS OF ART PRIZE DRAWINGS.

OUT of a number of 364,986 drawings submitted from schools of art throughout the kingdom, 2,127 have been selected for National Competition. These drawings are now on view on screens in the South Kensington Museum. Seven gold medals have been awarded; these are taken by the following schools: — Hanley, Hertford, Macclesfield, South Kensington, Stoke-on-Trent, West London, and Westminster. The 54 silver medals have been chiefly awarded to students at Birmingham, Cork, Manchester, South Kensington, West London, and Lambeth. No less than 14 of them go to the Manchester schools. In addition, 112 bronze medals and 210 book prizes have been distributed. Confining our attention chiefly to the designs and drawings of architectural subjects included in stages 23*a*, 23*b*, and 23*c*, it is gratifying to have to notice the improved character of the works. The design for a cathedral by James H. Tonge, Barrow-in-Furness, for which a silver medal is awarded, is a favourable advance upon former designs of this class. The author exhibits knowledge of detail without sacrificing breadth. Though a Late Decorated style is chosen, there is no want of dignified grouping. The towers at the west end are plainly and broadly treated, and are surmounted by low spires of timber; the centre tower is similar. A pleasing variation in the window heads is made in the choir: these are square, under flat, segmental arches, the traceried windows of clerestory show variety of design; the vaulting of nave and choir is sustained by flying buttresses. The cross section indicates detail of a refined character and feeling. No plan is hung. Alonzo P. Widlake, Bristol, takes a bronze medal for the same subject; the work, however, is marked by certain faults, amongst them being the ill-proportioned western towers and spires, and a very pretentious study of details, which are mechanical in effect; though the execution (in firm, ink lines) is deserving of recognition. A Nottingham student, E. H. Palmer, wins the same prize for a design of a church, the meritorious feature of which is the upper stage of the tower at the west end crowned by a low spire. The plan has an apsidal east end with transepts. Though the apse is narrower than nave, the roof is shown level throughout. A hardness of effect is given to the drawings by the very objectionable backlining. Another design by John F. Wilkinson, Kendal (book prize), is not happy in the proportions. A book prize is also awarded to William H. Higginbottom, Nottingham, for a design for a parish church of Geometrical character and cruciform plan, with central tower and spire and large clerestory windows, in which careful drawing is shown, though, like other designs, it has too much of the academical type about it. The other designs are not equal to those of former years. Among those which are hung is a design for an academy of fine arts by Robert Coxon, Newcastle-on-Tyne, exhibiting a few good points, such as a deep frieze. There is a lofty centre, and the detail is freely sketched in a Renaissance character. Near this is a design for local board offices and assembly-hall in a Classic Italian style, rather severe in treatment. There are pediments at the ends of the façade, which is of stone. For both these designs bronze medals are awarded. Walter H. Cooper, of Leicester, obtains a bronze medal for a design for a free library, a clever, coloured perspective, broadly treated. A silver medal has been won by William C. Midgley, Birmingham, for a design for an entrance to an art gallery. Italian Renaissance is the style chosen, which has been treated in a rather florid manner with Composite capitals to the main columns; the lower portions of the shafts are sculptured in relief; sculpture is also introduced on the pediment. Several designs for country residences are sent in. We may first notice two silver-medal designs. One is by Harvey Allport, student of the Training Class at South Kensington, a coloured drawing, Elizabethan in style, fine in execution, but weak in detail, the material being stone; the other is by Alfred Cox, of South Kensington, in a red brick and half-timber style, showing a carriage porch and tower over between the house and billiard-room. The plan is rambling, the entrance hall and stairs defective and wasteful. There is a kitchen court and offices round. A clever coloured elevation and drawings accompany the set, showing breadth of treatment and knowledge of Domestic work. A bronze medal is taken by Edwin L. Lutyens, South Kensington, for a country house of red brick, with coupled fluted pilasters at the angles and diapered ornament of 17th century character—meritorious and with feeling. The drawings are coloured. An hon. award is given to Tracy Tratman for a design for small mansion, with studio and music-room; the material is stone, and the style Italian, the drawings coloured. Next to which is a design for a board school, by William A. Watling, Newport, Mon., Queen Anne in style, of brick. The windows are mullioned, and have flat arches of double curvature; a bronze medal is awarded. We also notice a design for a municipal mansion by Arthur F. Davies, of Chester, for which a book prize is awarded —a pretentious Italian building, with tower entrances, shaded rather heavily in ink. A book prize is also given to the design for a gamekeeper's cottage, by W. Roland Howell, of Reading; a half-timbered design of Domestic Gothic treatment. There is merit in the drawings, which are coloured. Walter A. Catlow, Leicester, takes the same distinction for a design for a shop front and details, a design submitted in the Leicester Society of Architects Students' Competition. A. Pauline Cocks, Vauxhall, is the exhibitor of a pen-and-ink drawing for a cathedral church, weak in execution, with low western spires, chapter house, and a very bald-looking centre tower. A tinted design for a board school, by W. T. Conner, Glasgow, has some merit as a Classic elevation; the recessed orders and proportions are good, but the quoins in the lower story look weak. A bronze medal is awarded. Several drawings for entrance to an art gallery are hung. We have already mentioned one. Harry O. Hawkes' (Birmingham) design lacks gradation in the orders; Richard A. Rouse has two pediments superimposed—an arrangement that is never a desirable one; H. J. Pitts' is more pretentious: there is a flat dome over the hall, the façade being of two orders. These receive book prizes. Very few designs for interior decoration are hung. Percy R. Allen's (Nottingham) drawing for decoration of a drawing-room (book prize) is neatly executed. The author shows an Elizabethan treatment, but the design is cut up into parts, and there is a want of connection between the chimney or ingle-nook and the side-panelling of the walls. A village church, by John Mackintosh, Accrington, is simply treated; the nave and lean-to aisle on one side is roofed in one span, a dormer clerestory and small transept breaking the simple outlines. The ridge level is broken by a plain flèche, the details being of Decorated character. Why should this design only receive a book prize? Near it we notice two bronze medal designs for a wall fountain. George H. Graham has an idea that might have been worked out better. The figures in relief below the basin are cramped and out of place. Alfred C. Weatherstone's design, showing a niched recess in wall, with shell canopy and panels, with figures for jets, is meritorious; the coloured drawing represents marbles of several tints. Both receive bronze medals. A design for mantelpiece, by Joseph A. Pearce, is clever, but the proportions unsatisfactory.

We may now draw attention to a few of the measured drawings which have been submitted. On the whole the draughtsmanship is of less merit than it was last year. James A. H. Harper, Birmingham, takes a silver medal for drawings of King Edward VI. Grammar School—a Late Gothic porch with rampant lions on buttresses drawn boldly in ink. A silver medal also goes to Harry Percy Adams, Ipswich, for carefully-executed drawings of a font and screen. The former, in Ufford Church, Suffolk, is a particularly fine example of carved woodwork decorated in colour and gilded, of the lofty pierced tabernacle type. The screen is from Dennington Church, Suffolk, of 15th-century character, and occupies the south side of north transept. The colours are in yellow, red, green, chocolate, and black—a fine example of polychromatic decoration. Both drawings are carefully executed in ink. A silver medal is awarded also to Andrew Erskine (Manchester) for measured drawings of portions of Haddon Hall. The elevations of the ball room and a sheet of details of the woodwork are executed with vigour, though the shading is "woolly," and would have been better omitted. Benjamin John Fletcher, Coalbrookdale, contributes drawings of portions of Benthall Hall, Shropshire; Charles B. Howdill, Leeds, drawings of Oakwell Hall, Birstall, rather heavy and mannered in style; Harry Brooke, Leeds, drawings of oak chancel screen of St. John's in that town, a massive work dated 1631, of Elizabethan character; William George Townsend, Derby, drawings of wrought-iron gates of All Saints Church, with panels; Herbert C. Reid, Wakefield, drawings of the Gate of Honour, Caius College, Cambridge; Charles J. Brooke, Great Yarmouth, details of No. 54 Room, South Quay, in that town, well-executed drawings of the panelling of wall and door, and ceiling decoration; William Henry Lord Peterborough, drawings of parts of Peterborough Cathedral, all of which drawings receive bronze medals. A book prize is won by drawings of St. Mary's Church, Shoreham, by Arnold D. Smith, Brighton.

We now turn to designs. Gold medals have been awarded to two modelled designs, one by Charles T. Williams, of Hanley, for a vase of classic outline, jug-shaped, relieved by low relief figures and guilloche borders round the body; and a modelled frieze by Walter Turnbull, Westminster, in low relief, a scroll with amorini and a cupid within a centre wreath, very chaste, and refined in treatment, and Adamesque in character. In the silver-medal class we note two modelled designs for door knocker by Oliver Wheatley, Birmingham, clever and spirited in execution; a modelled design for a panel with centre mask by N. Illingworth, Lambeth; a design for a Jubilee cartouche in the plasterers' competition, by Ethell Ellerby, Manchester, which lady student sends a pleasing figure composition for decoration of majolica urn. Both display refined taste A design for a frieze (modelled), by John Shields, of the same town, and a design for a panel, introducing figures and foliage, "Earth, Air, and Water," modelled by Lehmann Oppenheimer, also a Manchester student; another by President J. Brooks of the Technical School, showing a modelled design for a frieze, with female figures in a folial scroll. The Regent-street Polytechnic Art Class, F. T. Dickens and R. Williams, take bronze medals for designs for pillar and a panel in carved wood. A design for decoration of a water-jug by Saranna Schofield, of Manchester, representing "Narcissus," is worth notice as a graceful composition in colour, for which the silver medal is awarded. Gertrude Ginn, who wins a gold medal and Princess of Wales scholarship, of Hertford, sends a pleasing design for floor tiles in flat tints of blue,

green, and brown; lizards and conventionalised foliage make up the design. Ellen Batters, of the same school, receives the silver medal for a tile design. Amongst the designs for wrought-iron must be mentioned Herbert C. Cane's (South Kensington) drawings for gates for a baptistery, one of the panels containing cross in the South Kensington Museum, and others made to agree—a clever arrangement of metal-work. Maud C. Fisher, Bristol, shows a chancel screen or gates of wrought iron in St. Mary Redcliffe Church, a finely-executed drawing; and Gerald Hutchinson coloured drawings of wrought-iron gates in Temple Church, and details, all of which receive bronze medals.

The wallpaper and textile designs are numerous. In this class we must notice a folial design, green on white ground, by James West, of West London School (silver medal), and another design by Amy Woodall, of the same school (bronze medal). A design for a carpet, by Jane Glanvill, Manchester, who receives silver medal, exhibits an original disposition of flowers and foliage arranged geometrically in squares, and in nice colours. John Macfarlane, the same school, wins Owen Jones's prize, a silver medal, for a table-cover design, in which there is a festoon border with medallions introduced in the centre for initials, of a pale sea-green. Fanny Roylance also has a bold scheme of treatment for printed cotton, in which flowers and green leaves are arranged on a blue ground, spotted with small white flowers. Thomas J. Donohue, Macclesfield, wins the gold medal for a design for silk-hanging. Amongst the bronze medal designs we may name a printed hanging in bright blue with birds and foliage, by Jonathan Kirkpatrick, Glasgow; a rich silk-hanging by Samuel H. Moss, Macclesfield; another printed hanging with birds and foliage, on blue ground, by J. Lattimer, Manchester; a bright and delicate treatment for Madras muslin curtains, by Maud Johnson, of West London school. A silver medal is awarded to Caroline Beatson, Cork, for a panel of lady's silk dress in crochet lace. A lace flounce, by Agnes E. Farman, Leicester; Emily Anderson, Cork; and the lace curtains by Charles S. Cullen and W. H. Pegg, Nottingham, take bronze medals. In the designs for cotton prints we notice neat arrangements by Arthur E. Jones, and F. W. Hatton, of Manchester; other designs being exhibited by Herbert Davies, Thomas McLoughlin, E. T. Orrell, T. Redfern, G. Warren, H. Bayley, Ellen Robinson, Scarborough. We cannot further here allude to the designs in this stage, which are numerous, and worthy of the prizes awarded.

In other stages a gold medal is won by William H. Prosser, of West London, for two models of figures from the antique, of wrestler and thrower of spear. W. Sadler, of Lambeth, takes a silver medal for a model of figure, in which class also we must mention the clever models of the figure from the nude, by John Rhind, of the S. K. Training Class (gold medal), the models of figure from life and the nude by Frank Bowcher (silver medal). Alfred C. Weatherstone has a full-size cartoon of a stained-glass window, and a design for a frieze—maidens with musical instruments, both of high merit as composition. In the same stage of study May Bowley, of Blackheath, sends a design for a painted panel, representing music—a well-arranged figure composition in water colour. Amongst other studies is a design for room decoration, by Alfred H. Coyle, of West London, for a side of room in oak, in which a deep frieze of subdued colour is introduced, and a nice distribution of panels in the wall surface below. A design for a piano front, by Emma Hinchcliffe, St. Thomas Charterhouse, is clever. A figure design for stained glass, by Georgina A. Mair, in which there is a nice, quiet, domestic treatment of figure panels representing seasons; a frieze and door panel, in oil, by Henry C. Morrow, and monochromic studies in oil of ornament from the cast by Paul F. Maitland, and Thomas McKeggie, receive honorary awards. The chalk drawings of figures from the antique and the nude, and the oil and water-colour groups and studies of still life are of much merit, and we must reserve them for another notice.

THE RIGHT WAY TO PROMOTE TECHNICAL EXCELLENCE.

JOHNSON and Boswell were one day discoursing on the universal thirst for knowledge. "There is," said the Doctor, "nothing which we would not rather know than not." Taking a wherry from the Temple Stairs, Johnson pursued the subject, and took occasion to illustrate his contention by asking the waterman what he would give to know about the Argonauts. "I would give what I have, sir," replied the boy. "But the acquisition of universal knowledge," continued Johnson, "is rendered impossible by the nature of the limitation of the human powers." This omniscience would now, however, appear to be regarded as possible, and as the true aim and end of education. To satisfy the modern craze for a vast lateral extension of knowledge, the nation blindly sacrifices accuracy and depth. All the notions that prevail with respect to technical education, for instance, are founded upon the undue importance that is attached to this lateral extension; it is erroneously supposed that those who possess the greatest amount of information are the more intellectually efficient—the better prepared to achieve technical excellence. The public forgets that the English workman was unrivalled before science teaching and technical education were dreamt of, either here or on the Continent, and that he is still, and without this now-fangled education, unrivalled in all the essential qualities of good workmanship. He may possibly be somewhat behind in the decorative arts; but if in these, in these only, for to excel in these requires a delicacy of sensuous perception, which all the science teaching in the world would never confer, but which would, on the contrary, rather impair than develop; for this sensuous constitution, if it be not by nature, can be developed only by a judicious system of training. We know that the great school of colourists, the Venetian school, did not come of science teaching, for no reliable theory of colour had at that time been formulated; they were fine colourists on account of their perfectly constituted sense of sight. All good workmanship, in so far as taste and the handicrafts are concerned, depends upon the perfection of the human mechanism, and not upon a prodigious amount of information, and this perfect constitution, or mechanism, if a man have it not by nature, can only be developed by a remedial process of training—a *re*-formative process. It was the perfection of the native human powers that enabled the workmen of Egypt, Greece, Rome, Mediæval Europe, China, and Japan to produce marvellous work without the knowledge of reading and of writing, before even physical science was thought of, and, therefore, without any such system of technical education as is now proposed. We may perceive, then, that what is now contemplated by the would-be technical improvers is not in the slightest degree essential to the production of excellent workmanship, and, if not essential, the forcing of technical education upon the workman is utterly unnecessary, and not only unnecessary, but mischievous.

Certain it is that since this cramming of knowledge has been the fashion, and has prevailed in Europe, its peoples have not rivalled the famous art epochs; and this new education, it should be borne in mind, has prevailed for a longer period than it took either Greece, or Italy, or the Netherlands to achieve excellence in the fine arts and in the art manufactures. Consequently this superficial extension of study has not accomplished what was and what is still vainly expected of it. The fine arts and the art manufactures, it is true, have not received that liberal and continuous encouragement vouchsafed to them in former times. More especially has this encouragement been lacking in England, where it has long been the fashion to collect ancient art and workmanship instead of employing native and contemporary talent in adorning private mansions and great public edifices. The capacity to excel in the decorative arts may have suffered deterioration in crowded centres of population; the human system may have degenerated senses, intellect, and physique. The remedy for non-encouragement is simple and obvious; but that for deteriorated senses requires further consideration and explanation.

From the fine arts we may pass on to review mechanical work, craftsmanship, and of this we may also affirm that the greatest inventions and the finest work, inventions and workmanship, that gave us pre-eminence amongst the nations, were the products of times in which "obsolete" was coupled in our dictionaries with "technical," and when technical education was undreamt of. The English workman holds his own in the marts of the world without such education; nevertheless he is repeatedly admonished that if it be not immediately adopted his case will be hopeless.

Whatever technical means be openly adopted for the improvement of workmanship will, we may rest assured, be followed by other nations. Are we not capable of holding our own in workmanship without copying French and German technical procedure? The project for a Central Technological College, which I put forward in 1851, was put forward before the "cry" for technical education was heard either on the Continent or in England; but that college was designed, not for the education of the workman, but of the manufacturer, the controller, the director of work. The workman's function in manufacture is distinct from the master's, and is one that depends on correctness of eye and dexterity of hand. It would, indeed, be a political and a social injustice to tax the middle classes in order to place the working classes in an educational position to compete with their children and to obliterate the landmarks in a graduated social domain. But this is just what your over-zealous technical educator is doing.

Then, what are we to say of the School of Wood Carving? It is a plan of encouragement in direct contravention of the principles of political economy. What was the nature of the encouragement which brought forward Grinling Gibbons, Mount, and others? It was essentially the same as that which was adopted in all the great epochs—viz., demand, a liberal demand for the exercise of their talents. Is the nation losing its head, that it must needs invite an Italian carver to come over to instruct apprentices in the art, and call this the encouragement of wood-carving? Who is to employ the carvers after they have served their time? "What would you have, then?" it may be asked. "You yourself confess that educational reform is needed; what is the nature of the reforms you would propose?" Let me endeavour to answer the question. To answer it, and to explain precisely what I mean, is, however, by no means easy, because most persons have not yet learnt to discriminate between the physiological perfection of the intellectual powers and the intellect of the memory, a kind of second-hand intellect—between the perfection of the instrument of thought and a mass of materials with which that perfect instrument can alone satisfactorily deal; these are two very different kinds of things. The former is by far the more important of the two, and in considering the subject of technical education we must never for one moment lose sight of the important truth that unless the intellect, the instrument of thought, be perfect in its constitution men will be unable to rightly handle any kind of knowledge or any kind of tool.

As a general principle it may be assumed that the perfectly constituted human being, mentally and physically, is the most fitted to excel in any human aim, and, on the contrary, that all imperfectly organised human beings are in various ways and in different degrees less fitted for the performance of truly excellent work. The aim of education, therefore, the primary aim, should be that of developing the man intellectually and physically, the perfect human constitution, by a remedial or *re*-formative process; for in the

vast aggregations of human beings, which is one of the characteristics of modern times, there are deteriorating influences which tend to mar the senses, the intellect, and the physique, to specialise and exaggerate some faculties, and to dwarf others—which, in other words, tend to induce disparity in the system—at the expense of that healthy and efficient symmetry in which perfect well-being consists at the expense of that balanced condition of which it can alone he said that the *mens sana in corpore sano* inheres. And as it is from this condition alone that we can reasonably expect good workmanship, we should lose no time in instituting an educational system calculated to reinstate or restore it when impaired by untoward circumstances. A true system of formative training, at the same time that it is health giving in its tendency, is the best preparatory discipline of every kind of work.

This formative motive, as an educational principle, was, I have every reason to believe, thoroughly understood by the Greeks, and to this circumstance may be attributed their excellence in every kind of human attainment. This formative motive, however, has been entirely lost sight of by Mediæval and modern educationists. The educational routine adopted by our ancestors has been preserved intact and as if it did not admit of being improved. The curriculum is a course in book-lore, and the only change that has been attempted in recent times is a change for the worse—viz., an extension in quantity, miscalled the higher education. Hence the mistaken notions which prevail with regard to technical education, and the fallacy that men can be made more perfect intellectual instruments, better workmen, by "cramming" them with all kinds of knowledge. What does this education, which has remained in Chinese fixity for several hundred years, do towards improving organisation? Nothing, literally nothing. It compels every individual, no matter how differently he may be constituted, to labour over precisely the same course. It seems to have been thought, and still to be thought, that knowledge itself is power, whereas knowledge is alone power in the grasp of the intellectual mechanism that is capable of wielding it. The less perfect that mechanism is, the less capable will a man be of doing good work. The Mediæval system of education to which we persistently cling was founded on the fallacy that the packing of *impedimenta* in the memory was education, and the modern extension of this system, miscalled the higher education, on cramming much more into the memory. Modern education takes no thought how to improve the imperfectly-organised eye, or the imperfectly-constituted ear, or any constitutional imperfection whatever, and it is by addressing ourselves to the correction of such defects alone that we can reasonably expect to exalt the quality of work. The committing of the sciences to memory will neither improve the senses of sight nor of hearing. We still refuse to make either the blind to see or the deaf to hear, and yet we are absurd enough to expect perfect work from the maimed. We still fail to perceive the significance of the precepts of the Great Teacher, and that the true purpose of education is that of "healing." This is where your general as well as technical systems of education are at fault; your educational nostrums, instead of being remedial, only tend to exaggerate the evils you would correct. That increased taxing of the memory, which is your sole idea of educational reform, would only tend still further to exalt that faculty at the expense of observation and of reason. It is that surcharge of the memory which is day by day making the national intellect more superficial and incapacitating it to deal masterfully with anything. The history of the arts and of the manufactures proves beyond doubt that a knowledge of reading and writing and of the sciences has little or nothing to do with excellence in handicraft. To excel as an instrumental musician, the prime requisites are a perfectly constituted ear and a dexterous hand; to excel either as a painter or sculptor the prime requisites are a perfectly organised eye and a dexterous hand; and so of all other workmanship, perfect senses and dexterous hands are the important requisites. A knowledge of the sciences will neither perfect the sense of sight nor of touch, nor produce dexterity of hand. All bad workmanship proceeds either from defective organisation or want of practice, not from deficiency in scientific knowledge. If, therefore, we desire to improve technical skill, my contention is that we must, above all else, bend ourselves to the rectification of marred organisations. To attempt this with any reasonable chance of success, we must commence the work whilst the human system is plaster and ready to yield to the "potter's hand." It is to our School Board schools that we must turn for the improvement of British workmanship. In them we must initiate a system of formative training for one of "cramming," a system which shall have for its object the symmetrical development of the man. To complicate this stage of education with the use of tools would be absurd, and but to muddle up the distinct functions of the school and the workshop. What tools is it proposed to introduce—carpenters', masons', or engineers'? The project will not bear the slightest reflection. Every kind of tool could not be introduced, and if one kind were adopted you would turn out some special class of workmen out of all proportion to the demand for them. As soon, however, as we leave the consideration of handicraft, and turn to that of braincraft, to inventing, to planning, and directing, a knowledge of principles of scientific theory is required. But this is altogether a different *mètier*, the business of another class, and it is for this class and not the working man that technical education should be provided. It is scarcely necessary for me to state that although it may be proved that the finest workmanship may be produced by men who can neither read nor write, yet that I by no means undervalue these acquirements. Reading is the gate to knowledge, to the storehouses of experience. It is the gate both to instruction and entertainment. It is an acquirement by which men can become better informed and wiser; but an acquirement that will not make men one whit more skilful as workmen. Science is constantly opening up new fields to workmanship; but the power of handicraft will be no greater than it was before scientific knowledge was more generally diffused, and since which in the fine arts and the art manufactures it has declined. The good workman, like the poet, is born, not made; unless we can take up either an arrested or a deteriorated organisation and develop it to finer issues. I believe this to be, to a very considerable extent, possible if educational training would only address itself to the work when organisation is plastic and capable of being moulded aright, and when now we only "cram" with information. We must rectify defective nature by training the senses, the memory, the reason, and the physique during the season of youth. We should regard the School Board shools as preparatory schools, as the nurseries of technical skill, looking more to the development of the manhood than to how many subjects can be "crammed" into a poor boy's brain. We should then have in those schools a course of intellectual and physical gymnastics and a curriculum consisting of the national language, drawing, music, and physical exercise. I hold that at this period the course should, in the main, be gymnastical intellectally and physically. The State has no proper business with special or technical but only with general education. Special education should be provided by voluntary effort, and should, in all cases, be purchased by the would-be recipients. The general education of the country should be essentially "formative." The following list appears to give the measures which are imperatively needed for the preservation and promotion of technical excellence: (1) A system of formative training in the School Board schools—in all the elementary schools of the kingdom. (2) A grand central technological college for the education of the manufacturer, the master, and the controller of work. (3) Local colleges, wherein any special talent might obtain the knowledge required at a moderate cost; where popular lectures should be delivered in the evening. I have suggested that the schools of the Art Department should be utilised for these purposes. (4) An annual exhibition of workmanship, both in the manufacturing centres and in the Metropolis. (5) A more lively and discriminating encouragement of art and art manufacture by the wealthy classes; the prompt abandonment of the practice of making private mansions museums of the old masters and of bric-à-brac. (6) To testify to the manufacturers throughout the kingdom the expediency of looking to the efficiency of their apprenticeship systems. (7) The reinstatement of the guilds as Trade Intelligence Departments; each guild should have travellers to go abroad and to report what is being done in their special craft; each guild should meet every kind of information appertaining to the craft it represents, and be the centre of reference for that craft.

W. Cave Thomas.

8, Fitzroy-street, July 31.

THE PROFESSION OF A CLERK OF WORKS.—III.*

By Thomas Potter,

Author of "Concrete: its Use in Building," "The Construction of Silos," &c.

WHO SHOULD BE CLERK OF WORKS?—SALARY—PLEA FOR EXAMINATION AND DIPLOMA—CIVIL SERVICE CLERK OF WORKS.

VERY few buildings nowadays take longer than two years to erect and complete, and as the salary is supposed to cover all his expenses, the moving of himself and family, should he have one, is a constant source of expenditure, and, as a result, many prefer a fixed abode, obtaining employment as near thereto as possible, and living in lodgings convenient to the works, provided that the latter are too far distant to travel to and from daily, in which case once a week has to suffice, or, if very remote, once a month, or less frequent even than that. The ascertained addresses of 50 architects' clerk of works five years since, and at the present time, show that 30 have changed their residence, and, of course, not one is engaged at the same building now as at the former period, although several are employed by the same architect. Probably, those whose families have not adopted migratory habits belong to the section who prefer a settled home, making use of it when they can, and perforce doing without it when they cannot. Another disadvantage is that, on the completion of a building, the architect may not have another vacancy, and the clerk of works has, therefore, to seek "fresh fields and pastures new," and often to wait for some time before a suitable appointment offers itself. He is, indeed, very much the victim of circumstances. He may be sent to, and remain perhaps for years in, some far-off locality, engaged in superintending the erection of mansions, public buildings, or extensive works of some kind or other, and on completion he returns from his starting point to find his old associates have gone away or deceased, or, like himself, have been sent to distant parts. New men have also risen, new building appliances and forms of construction have been invented, and he finds it not so easy to obtain a "berth" as formerly, and after making endless inquiries, and, like Mr. Macawber, waiting for something to turn up, perhaps advertising, all without success, he takes the first offer he can get on the assumption that "half a loaf is better than no bread." Then, again, when incapacitated by age, accident, or infirmities from further active work, having had, not from any fault of his own, a number of different employers, he possesses no moral claim or expectation from anyone for long servitude, nor can he look forward to extraneous aid from such quarters. Still another factor in the matter of "salary" is that there is no prospect of further promotion when once a man has risen to be a clerk of works—or fallen—as is sometimes the case when a builder in an extensive way of business fails, and is unable to find friends and means to give him another start in life. If he is known by architects to have a good knowledge of building matters, and is of temperate habits, he falls back upon that occupation, and if the saying that an old smuggler makes a good custom-house officer holds good, he should be the right man in the right place. Once a clerk of works always a clerk of works for the term of his natural life—unless indeed he so far misconducts himself that he can find no architect who will employ him or recommend him—is the lot of nearly every member of that profession. No amount of perseverance or increased knowledge gained by close attention and long practice can help him, for his salary

* All rights reserved.

remains much about the same from the commencement to the end of the chapter, and this raises another matter in connection with the subject — the uniformity of salaries. The employer of labour who numbers his workmen by the thousand, does not pay his managers or agents having charge of works on which hundreds of workmen are employed a salary but little above that of others who may only have the work of a score or two at most to look after; but according to the extent of work to be supervised, and the capacity and energy of the person appointed to supervise it. Per contra, the clerk of works engaged on a building upon which thousands of pounds are being expended, and which is being hurried along at high-pressure speed, receives as a rule but a trifle more than another whose work—practically a sinecure—consists in supervising the erection of, say, a village church, which may be jogging along at a "go-as-you-like" kind of speed. As before remarked, the notion clings to many people that if a man is a superior workman that alone is the sum total of the attainments needed, and the remuneration should accordingly be equal to, or but little superior to, that of a first-class artisan. Some architects even are of this way of thinking; one eminent in his profession, and with a large practice, is noted for the low salaries he is in the habit of paying, recruiting from builders' foremen when his clerk of works find more lucrative employment. Occasionally, candidates anxious to change their position for clerk of works' appointments, and more or less qualified, will accept for a start in that direction almost any remuneration offered them, no matter how small it may be, in the hopes that it will lead to something better, and that a reference to an architect of repute will insure them future employment of a more substantial character. But every man knows his value, and it is the underpaid clerk of works who, as a rule, thinks it no sin to rob Peter wherewith to pay Paul; some of the grossest swindles in connection with building contracts have been perpetrated—many never having been brought to light—with the full knowledge and direct connivance of the clerk of works in charge; but three-fourths of such cases might be traced to the fact that the latter individual has been selected for his apparent cheapness, better men being able to command better salaries, and more careful of their reputation and honour. Corporate bodies are supposed to possess no souls, and the individual members thereof, to enlist the sympathy of those by whom they are elected or appointed, by cutting down expenses and the salaries of officials; but the Birmingham Board of Guardians appear to look upon matters of this kind in quite a different light, for in 1886, having determined to build a new infirmary, they advertised for a clerk of works at £6 a week, and the committee's report says, "they did this in order to attract exceptional good men, and the applicants included such men." A guardian remarked that the salary was excessive, for the clerk of works who superintended the erection of the Council House was paid four guineas a week, while the one at the Art Gallery received three guineas at first, but subsequently three and a half guineas. Another guardian, in reply to an observation that if the board paid £6 it would be the same that clerk of works were receiving in other parts of the country, said there was only one in England who received as much. This assertion, without any possible means of obtaining such information, must have been entirely guesswork. In the end the £6 was agreed to. It is not suggested, however, that the clerk of works is, as a rule, badly paid; perhaps taking the average qualifications of all calling themselves by that title and acting as such, and their remuneration, they are fairly paid; but the grounds of complaint arise from the practice of paying a fixed salary more or less, according to the architect's or the employer's ideas of what clerks of works are, on the average, worth, and not by merit. All other occupations and professions of a similar nature are subject to a more or less elastic sliding scale of remuneration; but the clerk of works' salary is regulated in the way described, or it may be according to the employer's point of view as to how much an individual who will undertake the duties can be obtained for, the consequence being that large employers of labour always command the best ability, for, as before stated, they recognise no fixed remuneration for services rendered, and are alive to the fact that by paying more than the standard salary of a clerk of works they can retain the services of the most competent men. Until it becomes a recognised fact that the clerks of works' salary shall depend upon their standard of efficiency so long will their average attainments be only those of mediocrity, and there is no denying the fact that while very many are efficient and trustworthy, others are unfitting and unreliable, and act as an incubus on those who are striving to do their duty. The two great disadvantages that candidates for the position of clerks of works have to contend against are that, beyond the workshop and the buildings as training grounds, they have little else to fall back upon as means of gaining the supplemental knowledge essential to competency, and that no diploma or certificate is obtainable which at once and for all would stamp its recipient as efficient, or indicate in what degree he may stand in this respect; some such means are open to most other professions, and although many may be of doubtful value, yet there is scarcely any other class whose services are of so responsible a nature, which has no channel whatever from whence to obtain some evidence of competency and fitness. South Kensington has been instrumental in affording material aid in advancing practical and scientific knowledge; but this is only one place, and its advantages limited to those who may be residing within easy distance. Many provincial branches of that establishment are not credited with being able to give very valuable assistance in obtaining an advanced knowledge of building technicalities, and their honours, diplomas, and certificates of competency in building construction have not as yet been regarded as very satisfactory evidence of undoubted ability to superintend the erection of important buildings. If the incapable element could be eliminated, and if architects would themselves take steps to render it necessary that every clerk of works should obtain some reliable certificate of competency before he could assume that position, it would have the effect of establishing degrees of individual fitness, placing the best men in the foremost ranks of their calling, and relegating those who have no business to claim the title at all to their proper sphere in life. As a matter of fact, it is somewhat remarkable that the class of men upon whom architects have to rely so much for the proper carrying out of their designs, who are perforce left, perhaps, for weeks or months free from any personal control or observation, gain all their knowledge and experience in a haphazard kind of way, totally unaided by the advice and assistance of their future employers—architects. No lines are laid down by the latter as to the course of study necessary to pursue; no one ever hears of an architectural society discussing the qualifications needed by a clerk of works, and how best to acquire them; and the presence of the latter at any of their meetings where purely technical matters are discussed, if allowed in some cases, is certainly not encouraged, and is an extremely rare occurrence; and yet who would be so likely to gain information on many matters that hitherto he has not come across from papers and discussions which are so frequently taking place before scanty audiences limited to architects and their assistants? or who so capable of throwing light upon many matters affecting materials and their use as the clerk of works of many years' experience? Surely it cannot be *infra dig.* for the members of architectural societies to admit to their meetings when technical and constructive matters are under discussion, for the purpose of benefiting themselves and their employers through what they might hear and see, the men whom they are about to intrust to carry out their designs? If, as a body, the standard of fitness requires to be raised, means should be permitted and adopted to accomplish this. If architects require thoroughly-qualified and trustworthy clerks of works, they should create facilities for acquiring competency where none exist, and recognising ability and trustworthiness where proved. The lately-adopted registration of plumbers, the compulsory examination of the R.I.B.A., and similar means of establishing a guarantee that individuals who claim to be experienced in their avocations or professions are what they profess to be, is finding favour in many quarters, and were one or other of the architectural societies to establish a voluntary system of examination for clerks of works, mutual benefit would be conferred on employer and employed. Many of the latter would no doubt differ as to the feasibility and advisability of accomplishing this, especially those with but a small chance of passing even a mild examination; but a standard of efficiency would be the means of placing the best men in the foremost ranks and weeding the profession of many who make up for their want of necessary attainments by the possession of a fawning obsequiousness and an abundance of assurance. The only way an employer has at the present time of ascertaining whether an applicant is a fit and proper person to act as his clerk of works, except from personal knowledge or from having previously employed him in a similar capacity, is from testimonials which he carries about with him, or references to architects and others under whom he has previously served. The former are in many cases valueless, for they refer possibly to antecedent periods in his history, since which he has perhaps very much altered in his general character; moreover, the writers may have had but few opportunities of judging his conduct and abilities, and been hoodwinked in many ways. Again, some persons from a charitable feeling that they would not wish to step in the way of his future advancement, allow their good nature to overrule their better judgment, and gloss over his bad qualities, while they make as much as possible of any good ones he may possess. It has been said that forged testimonials are not altogether unknown; under any circumstances, written testimonials given to the person they are intended to benefit are at the best doubtful recommendations, and should be accepted *cum grano salis;* for this reason, personal references are now more generally permitted by architects in their relations with clerks of works, and are in every way preferable. But references to individual architects are sometimes attended with disadvantage as far as the clerk of works is concerned. A man may possibly remain in the service of one employer for years; the latter dies, and the reference which to the clerk of works seeking a fresh appointment is almost indispensable is gone for ever. The fact that he has been under a certain architect for a considerable period is not always sufficient evidence of his abilities, while employers experience the fact that it is far from safe to place implicit reliance upon testimonials or references of years ago, or to present habits of temperance and sobriety. But associations or societies, composed mainly or entirely of architects, would be in a far better position to fix the standard of a clerk of works; they would not as a body possess the susceptibilities of individuals in such matters, and they would be justified in making searching inquiries as to the previous occupation, and past and present character and capabilities of voluntary candidates. Examiners selected for their skill in individual occupations connected with building processes, and in every way practically acquainted therewith—not all-round men possessing a mere superficial knowledge of half a dozen of the most important callings, and no complete knowledge of either—would very soon be able to determine the proficiency of candidates in each branch, and collectively the position they should occupy in the sliding scale of competency so far as the practical details of building construction were concerned. The moral and general character and auxiliary attainments so valuable and necessary for a clerk of works to possess, could be just as readily ascertained, and the result would be that while architects would be able to know the antecedents, present character, and actual capabilities of a clerk of works before engaging him, the latter would be under no necessity to produce a string of testimonials, or become a victim to the possible whims and vagaries of his last employer. The position of civil service clerks of works is undoubtedly better, all points considered, than that of the architects' clerk of works: the salary is higher, the employment is in most cases permanent, and the knowledge required is not greater. Portsmouth, Devonport, and Chatham Dockyards have each a clerk of works to superintend building operations and repairs, at a salary

commencing at £250, and rising to £300 a year, with a residence provided or an equivalent in lieu thereof. The Office of Works employs nine permanent first-class clerk of works at similar salaries, and provides each with a residence, and sixteen second-class, whose remuneration commences at £150 and rises to £220; while at Broadmoor Lunatic Asylum the title of foreman of works is given to the individual who fills a similar appointment, with a salary of £140 and annual increments till the maximum of £190 is reached. These appointments are mostly open to competition, and which it is almost unnecessary to add is becoming keener and more hotly contested than when the system was first introduced. For the Office of Works, the following are the necessary qualifications:—"Handwriting, geography, English composition, arithmetic (to vulgar and decimal fractions), geometrical drawing, knowledge of materials, designing simple buildings, with specifications and estimates, and working drawings of details of carpenter's and mason's work, taking out quantities from plans, measuring and valuing buildings, and modern sanitation. Candidates must possess the practical experience necessary to qualify them for a situation of this nature. They must have been employed for at least five years in the superintendence of buildings, and will be required to produce satisfactory proofs of their efficiency and practical knowledge. No candidate will be qualified for an appointment in England or Scotland who has not acquired his practical knowledge, and been employed for the required time in England and Scotland respectively." It is a significant fact that competitors must not be under 28 years of age, and that there is scarcely any, if any, other appointment in the Civil Service but which is open to candidates several years younger. Why this should be is not explained; but assumedly the authorities conclude that efficient knowledge and capacity for the position is not as a rule attainable under that age. Clerks of works in the Prisons' Department of England are paid salaries commencing at £225, rising to £275; in Scotland, £300 to £350; and in Ireland it is fixed at £200. The limits of age for Civil Service clerks of works are 28 and 35, and as the number compared with other Civil Service servants is small the competitions are few and far between, and the chances of obtaining appointments therefore somewhat remote. The duties generally are of a similar description to any other class of clerks of works—viz., to superintend the erection of new buildings or alterations, and the same qualifications are essential. Clerks of works for railway companies superintend the repairs of alterations of stations and other buildings, and are necessarily under the control of the engineer's or architect's department.

"ONLY THIRTEEN!"

UNDER the above head a correspondent comments smartly in the new number of the "A. A. Notes," which continues as bright and interesting as ever, on the very few members of the Association who pass the examination of the Institute. He says:—

It is impossible not to be struck with the great contrast presented by the immense amount of good solid work accomplished year after year by the Architectural Association, with its many and far-reaching classes and lectures, and the number of its members who emerge triumphantly from the final ordeal of the Institute Examination.

The exact number of our members who have passed the Institute Examination during the last three years is 31, being an average of just over 10 per annum. How interesting, is it not? The National School of Architecture ought well to be proud of such a record.

Now, the remedy I suggest for all this is full and complete publicity in every sense of the word; and some of the means which might be utilised for this purpose are as follows:—

(1) Let the names and addresses of every successful candidate be published in full, not only in our own professional Press, but also in the ordinary newspaper of every-day life. Let the general public see what *we* think of our examination, and they will very soon begin to duly appreciate it, and to ascribe some meaning, and some honour, to the mystic letters which this examination now confers.

(2) Let every possible rite and ceremony at the command of the Institute be impressed into the presentation of the certificates. Let there be a full and complete meeting of the Council, and in the presence of the Professors, the Examiners, and other eminent members of the profession, together with the parents and friends of the candidates, and as many of the general public as can possibly be induced to attend, let the coveted honour be conferred. Let it be the great architectural ceremony of the year; and again—let the public know it.

(3) Let the certificates themselves be more in character with the examination. Great care should be taken in their preparation, as candidates like to possess some visible and tangible evidence of their success; and, surely, the small cost involved in the preparation of these documents would not be termed an extravagance. Men want something more than a circular.

But methinks I hear some cynical reader, in sarcastic vein, remark: "Why not ask for hoods at once?" and I take up the question in all seriousness. I do not know the rules and regulations affecting Academical Hoods, but I do most sincerely urge that a candidate, having passed his examination successfully, is, morally, as much entitled to a hood as his brother or old schoolfellow at the Universities. It is his degree, and should be regarded as such; and it is a grievance, aye, a distinct slight, to the architectural student that honours within reach of his brethren in sister professions should be denied him.

When the examination is a reality—that is, when it is the portal to the profession of architecture, and not to the mere membership of one of the professional societies—there will be no need to have to recourse to the expedients suggested. Meanwhile the members of the Association, which is a reality, and a credit in every way to the profession, naturally hold aloof.

A DECORATIVE PULPIT.

MESSRS. HEATON, BUTLER, AND BAYNE, of Garrick-street, W.C., have just finished the paintings and decoration of a pulpit for St. Barnabas Church, Oxford, which will surpass many other works of the kind in artistic interest. The pulpit was designed by Mr. Arthur W. Blomfield, and may be described as in the style of the Italian Renaissance, of polygonal form on plan, supported on six fluted columns with voluted capitals, which stand on a hexagonal shaped plinth, and is surmounted by a massive moulded and enriched sounding-board of octagonal shape. The material of the pulpit is walnut, and this has been used as the ground of the very rich and costly scheme of painting and decorations with which the whole is covered. The upright framing of pulpit is divided into nine sides or bays, exclusive of the staircase opening; the angles are adorned by pilasters, which carry consoles supporting a massively moulded cornice, each side having below the cornice a circular panel, and below it a long arched panel with side pilasters, the two panels being separated by an ornamental stringcourse of green ground with gold ornamentation. These nine sides have on the lower and larger panels figures of the saints with the nine orders of angels above on the circles in the following order:—1. St. Clement, with the Angeli, angels, above; 2, St. Ignatius, with the Archangeli; 3, St. Polycarp, with the Virtutes or Virtues above; 4, St. Athanasius, with the Potestates or Powers; 5, St. Chrysostom, with the Dominations; 6, St. Augustine of Hippo, with the Principalities; 7, St. Leo the Great, with the Thrones; 8, St. Gregory the Great, with the Seraphim; and 9, St. Augustine of Canterbury, with the Cherubim above, these numbering from the left hand. These figures have been painted with scholarly elaboration; the vestments have been carefully studied from old examples of the best period, the delicacy of the colouring and diapers being remarkable. The figure work is upon a gold ground diapered. The cornice, pilasters, and surbase mouldings are enriched by colours and ornamental gilding of Italian patterns and arabesques; the upper member of base is a rich ovolo moulding picked out with a leaf ornament on gold, and the bottom of pulpit is formed by the intersection of the twelve sides with the six sides of the columnar pedestal, forming an effective groining, the surfaces being enriched by gold ornamentation of grotesque birds and foliage upon the dark walnut ground. Each of the six columns forming the pedestal is fluted above in gold with dark fillets, the lower portion of shaft having the vine foliage in gold on a dark or brown-black, the voluted capitals picked out in gold. The deep, close string of the staircase is decorated by seven circular panels with doves representing the Seven Gifts of the Holy Spirit on red ground, with intermediate foliage panels. The balusters are also richly shaped and decorated. The sounding-board, supported on a framework of pilasters, with niche between, gilded, is a flat testoon massively moulded along the edge, and enriched by colour and gilding, with angle drops, and crowned by gilded cresting. On the underside of the sounding board is a cross and pelican centre, which is surrounded by thorns, and has an aureole of rays all in gold. The dark ground of the walnut, and the deep brown-painted background enhance the value of the gilding, and the colours confined in the plain mouldings are chiefly a deep red and greyish-green, the whole rich but harmonious in effect. The painting and decoration were designed and executed entirely by Messrs. Heaton, Butler, and Bayne, under the superintendence of Mr. Blomfield. The work has been, we hear, a considerable time in hand, and is to be fixed in St. Barnabas Church during the present week. We have called particular notice to this pulpit as showing the reactionary taste for Italian church building and decoration, and as displaying work designed and executed by an eminent church architect, and an eminent firm of ecclesiastical artists.

THE BOSTWICK FOLDING STEEL GATES AND SHUTTERS.

WE have examined some full-size models of the patent folding steel gate and shutter, named after the inventor, Mr. W. W. Bostwick, and manufactured by the Bostwick Folding Steel Gate and Shutter Company, 73, Queen Victoria-street, E.C. On a former occasion we referred to this improvement on the old-fashioned hinged gate, which has been for some time in use in some of the leading commercial houses in New York. One of the models we inspected represents a folding gate suitable for shops, stores, or offices, about 4½ft. high and 5ft. in width. This is composed of the folding pickets which slide level top and bottom—the patented feature of the Bostwick gate, hinged together by bars on the lazy-tongs principle, which are not only strong, but are ornamental features in the gate. There are two rows of these sliding hinges. Each leaf of the gate runs on a metal track or bar, which is hinged near the jamb so as to turn up, and they are stiffened at the top when closed by a stiffening bar, which also is hinged to the jamb, and can be folded up out of the way. When the two leaves are folded back they occupy scarcely 3in., the pickets sliding up close to one another, and can then be turned aside out of the way. A gate 10ft. in width can in this manner be folded in the space of 10in. and turned back out of sight. Nothing can be easier to work, neater in appearance, or stronger. A window-shutter which slides into pockets inside of the sash frames, is one of the most useful applications of the folding steel gate, as it allows light and ventilation for the room, and is much more secure than an ordinary shutter. These shutters can be made either to slide into pockets or boxes out of sight, or be folded back on the jamb or reveal of window. Our readers know what a clumsy contrivance the old hinged shutters and boxings are, how the back flaps get out of order and drop by their weight, and the difficulty experienced by servants in folding them back. The folding steel shutter, while being a better security against burglars, can be handled with the greatest ease, and the shutters are quickly opened or closed without coming into contact with chairs or people in the room. In planning windows or doorways, the only provision to be made is a small recess to receive the shutter or gate. The gates and shutters are made of pickets of rolled steel of a grooved section, which gives lightness and strength, the hinges working within the grooves. For interior purposes they can be made of bronze or brass or may be nickel

plated. These gates and shutters are secured by specially made locks, but can be fastened by ordinary padlocks. The Bostwick gates and shutters are worth the attention of all architects engaged in the planning of shops and storehouses. For closing lift openings nothing can be better adapted. However wide the opening, they can be applied by having tracks of metal above or below. For shop fronts nothing certainly can equal them in lightness, security, and easy working.

LEEDS ARCHITECTS AND THE LEEDS SCHOOL BOARD.

THE following appears in the *Yorkshire Post*:—

I have only to-day seen the remarks that appeared in your paper of the 16th inst. with regard to the terms upon which several Leeds architects have agreed to undertake architectural work for the School Board.

As I am one of these architects, I should be glad if you would kindly insert in your paper of to-morrow the letter which I wrote to the clerk in response to his circular of the 10th July, issued to Leeds architects, and asking them to name the terms upon which they would undertake architectural work for the Board.

The circular was forwarded to me while absent in Scotland, and the date at which I received it obliged me to reply by return of post. I had therefore no opportunity of consulting with any others of the profession in Leeds.

The Clerk of the Leeds School Board.
Gairloch, 14th June, 1887.

DEAR SIR,—I am obliged by your letter, forwarding copy of the resolution of the Sites and Buildings Committee. I should be very glad to place my services as an architect at the disposal of the board, but I am afraid that if the preference is given to the lowest offer, without reference to any other considerations, my terms would exclude me.

I may remind the board that in the first competition instituted by it, the first place was awarded to my plans, and the building of the first school—Bewerley-street—was therefore allotted to me, and that plan became in a great degree the basis for the arrangement of all the succeeding ones. I was also successful in the competition for the Green Lane school, and erected it. I also gained the competition for the Municipal Offices, which included offices for your board, and these also were erected from my designs.

Notwithstanding these successes in competition, no work has been given to me by your board without a contest, although commissions have been given to other architects without competition, who have either never competed, or else been unsuccessful.

I would therefore submit to the board that less favour has been shown to me, successful in three competitions, than to others who have not competed or have been unsuccessful.

I would suggest that as Messrs. Kelly and Birchall have been employed without competition to design and erect the higher grade school in Albion-street, that a similar principle should be adopted for the other architectural work of the board.

I do not know upon what terms these gentlemen agreed, but I am willing to undertake the architectural work of the board upon the same basis of remuneration as they accepted on that occasion.—I am, dear Sirs, yours truly,
G. CORSON.

On the 8th July Mr. Lee wrote to me that the Board proposed to put in my hands the extension of the Green Lane School for central higher grade teaching. I then for the first time learnt that Messrs. Kelly and Birchall had accepted much lower terms than those recognised by the profession, and totally inadequate as a remuneration for the services required.

I wrote to the clerk that these terms were totally inadequate, but that as I had undertaken to accept the commission upon the same basis of remuneration, I did not consider myself justified in repudiating my offer, and would execute the work accordingly.

I think it is very unfortunate that a firm of architects of such standing as Messrs. Kelly and Birchall should have set the example of receding from the recognised scale of charges. I can only hope that in all future work they and all other Leeds architects will settle upon terms which all can adhere to, and thus leave the question of employment by the Board to rest upon another basis than cheapness.—Yours very truly,

Leeds, 29th July, 1887. G. CORSON.

The Wesleyan chapel at New Romsey, Kent, is being enlarged and reseated from the plans and under the superintendence of Mr. H. J. Jeffery, architect and surveyor, of Ashford. Mr. G. Terry, of Lydd, is the contractor.

OUR COMPETITORS' COLUMN.

THE responses to our last invitation (for the present) have been fairly numerous. We place first the paper by "An Architect," which embodies the experiences of a well-known member of the profession, that by "Scotus" second, and that by Mr. H. Bragg third. On the whole—with the exception of last week—we are pleased with the results in the new column we have opened, and we trust to resume it in a few weeks when the holiday season has passed.

PRIZE PAPER.

"THE EXPERIENCES OF AN ARTICLED PUPIL."

PERHAPS it may be more interesting, and at the same time conveyed more clearly to the minds of those who are now undergoing their term of pupilage, if I relate my own experience of how I became an architect. At the age of eight years a public school, where some eight or nine hundred pupils were being educated, was to be my destiny. Going into a large school, with so many strange faces around me, it was months before I began to settle down to the routine of school life. There were naturally many likes and dislikes, but above all others the drawing school soon proved to have great attractions for me. Being particularly interested in drawing, I received great encouragement at home, and this probably determined my future. Freehand copies were given to me; simple though their outlines were, I remember spending hours over them, and never being satisfied unless they were true to the copies. A year had scarcely gone when the science and art examination was passed. Model drawing was my next step. What with the choice of groups and positions, it seemed as if there was to be no end to it. However, at last I succeeded in giving satisfaction to the head master of the drawing school, and he became more interested in me. Perspective, practical geometry, and the study of light and shade were next proceeded with, and at the age of 14 years I had passed the South Kensington examinations in these subjects. At this juncture I began taking private lessons in addition to school work. I studied from the cast in black-and-white, sepia and water-colour drawing, and often had the opportunity of accompanying the head master on sketching tours. The hints then obtained were never forgotten. All details and advice on various art matters were carefully recorded in a note-book kept for them. The last two years of school life proved of great value. I obtained prizes for water-colour and black-and-white drawings at South Kensington, and the first prize for drawing given at the school. My thoughts now turned toward two professions—an architect and artist. The former was selected, but not before I had asked my parents the question, "Whether an architect was an artist?" The reply was, "He ought to be." Arrangements were then made for my being articled to an architect for five years. I was fortunately the only pupil, and this, together with the kindness of the architect, enabled me to learn more than I otherwise should have done. My first idea was to make friends with the draughtsmen. They soon found I was always willing to try and do everything that was given to me, and it seemed to be a pleasure for them to answer the questions I asked. Plans of buildings were set before me to copy, and isometrical drawings were made from the plans copied. It used to be interesting to take notes of the different criticisms on each drawing when completed. At the end of two years, however, a change was made in my pupilage. The architect, on account of old age, retired from business, and it was then that I entered the office of one of our leading architects in the North of England to complete my articles. I became connected with two pupils in this office. One of them, through loose habits, soon caused me to be careful in office work, and not to spend more time than was necessary out of office hours. It was by no means a rare occurrence that I was asked to complete this pupil's work, so that he might enjoy himself. At the end of twelve months I had made drawings of all the Orders, with the details, and learnt the technical terms for each member, whether the Tuscan, Doric, Ionic, Corinthian, and Roman. At this stage I visited the buildings in progress, and was never weary of asking the men employed anything that seemed wrapped up in mystery. Whenever business demanded it I was always willing to sacrifice an evening's amusement to it. Fortunately there was a good library in the office, which I took care should be well looked into. Weale's series of constructional works, Tredgold's "Carpentry," Fergusson's "Handbook," Parker's "Glossary," and Nicholson's were all included in the list. In the last two years I was able to make plans from sketches supplied, and obtained a fair knowledge of prices by studying the several bills of quantities, and write a specification, together with a building contract. Upon the completion of my articles I became assistant in the office, and after some years was taken into partnership. In the foregoing I have endeavoured to give but a brief account of a pupilage. I may add a word of advice to all those who are now entering the profession. Learn to thoroughly understand everything you do. Visit all buildings you can; note any peculiarities in construction; make a free use of your note-book; work willingly and honestly; then doubtless in time you may become an architect, and one who may be justly proud of his calling. AN ARCHITECT.

PAPER PLACED SECOND.

Whether the experiences of an articled pupil are interesting or the reverse generally depends to a considerable extent upon whether he was anxious to enter the profession himself or whether he was put in by his parents on the erroneous assumption that it was a good paying business. It is of vital importance that a man should have his eyes open before being articled, or else he is very apt to find, after a few months, that he is in the wrong place, and that he will have to unlearn all he is learning whenever he has finished his time. The ideas which parents and the uninitiated have of the method of procedure in an office, and what really takes place, are an amusing contrast. The fond parents pay Mr. So-and-So a good many hundred pounds, and picture the great man personally instructing their boy, guiding his hand with almost maternal tenderness. He will take him to all his big buildings, introduce him to all his clients, he will be constantly with him, &c. That is the ideal. Let us now take a glance at the real state of affairs. The first morning Young Hopeful arrives in the office he is probably shown into the great man's ante-room, which is occupied by an individual who acts the dual parts of confidential clerk and "chucker out" of the ever voluble commercial traveller, men with patents, draughtsmen applying for "cribs," and objectionable callers generally. As this youth must necessarily, to some extent, be in his employer's confidence, he imagines himself a very important personage, and strikes great awe into the new pupil, who has probably the pleasure of sitting in his room for an hour and a half at least. At the end of this time he is honoured by an audience of his future master, who says that the best thing he can begin with is to do some tracing work. This short but trying ordeal over, our friend is then ushered by the said clerk into the room in which he is to disport himself for the next three or four years, where he sees two or three men and a youth, in seedy-looking coats, who regard him with evident suspicion. Here he gets started to his tracing at a back desk till the dinner-hour. An hour for dinner, he was told, so out he goes, and is back again to the minute, but is surprised to find no one else in the room. In another hour the men come dropping in; but the youth does not turn up till about four o'clock, and leaves before five, although the office hour is half-past. All through the long afternoon our tyro works laboriously at his tracing, always expecting a visit from Mr. ——; but before the day is done he learns that the "Governor" is away for a week, and he will find out in time that, far from receiving any personal instruction from him—what with the great works he has in progress, and the still greater that he is fishing for—he is a lucky youth if he occasionally catches sight of his master's back elevation as he dives into a cab at the office door. The remedy for this state of things would appear to be to go into an office where there is a small amount of work, and where, consequently, the architect has more time; but this, I think, is a mistake. The truth is, that for the first

eighteen months or so of his pupilage a man can learn just as well from the other men in the office; but, still, the master should take an interest in the pupil's work from the moment he enters the office. Some architects when they have pocketed the premium, and supplied the youth with a stool at a back desk, seem to think that their part of the contract is at an end, and either leave him entirely to subordinates or else to flounder about at his own sweet will. There is no doubt that a considerable number of the ills that the pupil's flesh is heir to are the result of the large premium system. "You mus'nt look a gift horse in the mouth," and a pupil with his father's big cheque in his pocket is rather like the gift horse. The architect hardly likes to look too closely into his antecedents, or to discover whether nature ever intended that he should put his head into the architectural collar. I would recommend those pupils who are still at the tracing stage to remember that, though it may seem an unmitigated bore, it is really the very best thing that they can be doing, provided it is done intelligently. Always insist on seeing through everything as you go along, and you will very soon get to understand the method in which working drawings are got up, and will consequently very soon be set to making working drawings yourself, as no architect is such a fool as to keep a man tracing if he is fit for anything else. A grievance which I have heard many articled pupils enlarge upon is that they never have a chance of seeing any practical work. If this is the case, it is a very real grievance indeed. When an architect takes a pupil, seeing that he generally takes no personal charge of him, the least he can do is to give his pupil every opportunity of picking up information for himself. I think all pupils who are with architects whose work is entirely in the provinces are entitled to get down for a week or longer at a time, to get as much practical knowledge as possible. You will never learn to distinguish between a well and a badly built wall, though you study "Rivington" on the subject till you are blue in the face, nor will you get a practical knowledge by tracing working drawings, and still less will you be able to write good practical specifications by copying the old ones in the office. This is a branch of work generally very much neglected by pupils. It is, however, of extreme importance to anyone who is anxious to become a good all-round man. In some offices the specifications are all written by the same man. This method, though it minimises the architect's trouble, is very unfair to the pupils, as it never gives them a chance, while in many offices the drawings are handed over to the surveyor without any specification at all. This may answer pretty well if the drawings are covered with notes, or where the surveyor has a thorough knowledge of the architect's style of work, but at best is a slip-shop and unpractical way of doing business. Any architect who does country work entirely, and sends his pupil down to live for a couple of weeks at one of his "jobs," will find he is amply repaid by the quickness with which the pupil will learn. Studying books is all well enough when combined with actually seeing work; but unless it is it is almost no use. A man may pore for hours over his "Rivington," studying "different bonds in brickwork," and find himself at the end so mixed that he probably knew more when he began; whereas a clerk of works could in five minutes explain and sketch all the bonds that are actually used in practice. When on a job, be there early and late; pump everybody and take copious notes, which ought afterwards to be copied into a book—any student who combines practical work and reading in this way should not have great difficulty with the practical part of the Institute examination. When a pupil is with an architect who has a lot of work going on in town which can be inspected either before, during, or after office hours the case, of course, is different; and this brings me to another point, which is, that I don't think pupils should be expected to stick slavishly to office hours. If a pupil wants to inspect some building in progress, or visit some workshop, he should not scruple to turn up an hour or two late. In offices which are managed on the "go-as-you-please" system there is no difficulty about this; but in others, managed on the factory system, it is not so easy, as there is probably a book to sign as you pass in the morning, or some member of the staff is told off to check the time. If there happens to be anything sketchable near the office, I think a man is quite entitled to put in a couple of hours' sketching in the middle of the day, or, if the office is not particularly busy, to take a forenoon or afternoon occasionally. These little matters can, however, generally be arranged without bothering the "governor" by asking for leave. I have sometimes heard pupils say that whenever their work comes to be directly remunerative to their masters they ought to begin to get a salary. I must say I think this is not a very serious grievance. A man knows before he enters an office what he is doing, and, considering that such a large percentage of pupils are never anything but a nuisance, when an architect gets one who is useful he is quite entitled to benefit by his work. However, there are sometimes exceptional cases, and it is an open question whether a pupil who comes to be a really valuable member of an architect's staff is not entitled to some "compensation for improvement." As regards the length of time a man should serve, I think four years is the proper length. Three is long enough for very clever men; but, for an average man, if he is in a good office, four is not too long. Five years certainly is. It is in vain for a pupil at the expiry of his articles to try to get into a good office as a paid assistant unless he has a good collection of measured drawings and sketches, and most men will find that to master even to a small extent the arts of sketching and making accurate, artistic measured drawings will keep them uncommonly well occupied for four years. For provincial men, who have not a chance of seeing the drawings at the Academy and the Institute prize drawings, no guide can be more valuable than the admirable plates of this kind which appear from time to time in the pages of the "B.N." Scotus.

PAPER PLACED THIRD.

After leaving school or college a timely advertisement in a local daily paper very often settles the business or profession that a lad first adopts, and afterwards figures in more or less conspicuously, and it is as well for parents or guardians to arrange, if possible, for the lad to go for a month or two on trial. He may at school develop a taste for drawing; but the work he does at school and the work he is expected to do in an architect's office are widely different. The master may not like his pupil, and the pupil, after a month or two, may find the work distasteful to him; but, on the contrary, if a lad likes his work after a trial, it is as well to get the indenture signed as soon as possible. And before this can be done the premium is usually a crotchety question, and it would be as well to have a clause in the indenture: "In the case of the master's death within a limited period of the articles being signed, that part of the premium should be returned"; and the parent should set aside a sum of money large enough at least to pay the pupil's lodgings during his articles, or it is possible for our young friend to find himself cornered through some unlucky financial speculations or the death of his parent. A pupil—I don't know why it should be so—is generally expected to do a good deal of fagging for about a year (in the shape of copying specifications which he does not understand, tracing, mixing ink, washing pallets, copying letters, running errands), or until some other pupil is drafted in to take his place. It is a good plan for a pupil to keep an office-diary, and dot down each day the principal items going on, and to make sketches of the same; this will often be referred to, not only in the course of a few days, but it is useful for reference years after. Where there are three or four pupils they are greatly encouraged by the governor, manager, or assistants getting up competitions for them, with a useful book as a prize, and there will be as much interest taken in the work as if the premium was large. The pupil should remember, if he is asked to do anything, to do it willingly, to the best of his ability, and to set about it as soon as possible, and in return he will have a good time. Any man in the office will assist him, and will be glad to have him out to measure up any building where work is to be executed, or will take him on the job, and in the course of an hour tell him what it would take months for him to notice; will show him a bit of old work worth measuring, and advise him about books worth reading, and very often where they are to be had. Then comes a month or six weeks' work on competition drawings, on which he figures largely with a pot of ink and a brush, blacking in the walls, or making a block plan showing drains, and when the premium is as good as in the governor's pocket, he may be asked to a dinner. Suppose we say you have had three years of office routine, your health would be improved, and you would get a lot of practical knowledge, if you can get on a building as clerk of works (alterations are as good as anything for you to superintend); you don't want to be too far from the office, so that if anything turns up that you are not quite sure about you can slip away to the office and make certain. You ought always to give your orders to the foreman and never to the men. And the foreman will give you a lot of information if you ask proper questions; but if you ask where he is going to make a start, he will most likely tell you they usually make a start at the foundations, and with the question you will drop fifty per cent. in the foreman's estimation. If the pupil knows a resident civil engineer on a railway in course of construction he would do well to spend his holidays with him, and in the course of a month he would learn to use the dumpy level, theodolite, and get some sound advice about surveying, sewers, girders, skew arches, &c. He can, with advantage, attend a school of art, and with a little persuasions with his friends they might start a modelling class, if there is not one already. The masters, as a rule, are very glad to receive suggestions, and to second any efforts of the scholars. It is a good plan to finish one drawing before starting a second, providing you are not designing a building; and to make as good use of your time generally as you can, or you may regret when you have only yourself to rely on that you did not make better use of your time when a pupil. H. Bragg.

BOOKS RECEIVED.

Elementary Treatise on the Strength of Materials and Strains in Structures, for the use of the Senior Students of the College of Science, Poona. By N. A. Moos, B.Sc. (Edin.), F.R.S.E. (London: Griffith, Farran, Okeden, and Walsh) Although professing to be an elementary treatise for the use of students at Poona, Mr. Moos's volume will be read with profit by many others. The book is written in the form of lectures, and not only enters into the mathematical principles of the subject of strain, but shows the application of formulæ. The deduction and examination of the principal formulæ occupy a large share of attention necessarily. Longitudinal strain, compressive and tensile loading, are considered at some length for different materials. Transverse strain is thoroughly exemplified, and examples are worked out with the aid of diagrams, chiefly of iron girders. Girders with concentrated rolling and distributed loads; braced girders, lattice girders, continuous girders, roof trusses, masonry dams, are treated fully, and the design of a girder forms the subject of the last lecture. There is very little that a young engineer wants in construction that he will not find explained; the explanations are concise, and, what is of much importance to students and practical men, only an elementary acquaintance with algebra and trigonometry is required. In the lecture on roof trusses, the author gives some very clear examples of stresses found by trigonometrical calculation, and also graphically, both methods in use being shown. The mode by reciprocal figures, and the method of lettering the diagrams, which is of first importance to prevent confusion, is made quite clear, and this part of the treatise will be found of especial value to architectural students. —— *Pocket Technical Guide, Measurer, and Estimator*, by A. C. Beaton (London: Crosby Lockwood and Co.), is the fourth edition of a well-known guide. The whole of the directions and data is comprised within the size of a waistcoat pocket-book, clearly printed, well illustrated, and carefully revised throughout. No architect, surveyor, builder, or valuer should be without his "Beaton's Guide."

BRICK CHURCHES IN THE SOUTH OF LONDON.

SEVERAL new churches in South London have been recently completed, or are in course of erection. A few weeks since we noticed the church of Corpus Christi, on Brixton-hill, from the designs of Mr. Bentley—a very fine example of a Roman Catholic brick church, relieved by stone in the dressings. Last Saturday, the Architectural Association visited three other churches at Streatham, in which brick has been wholly or partially employed. St. Peter's Church, in the Leigham Court-road, a very charming rural thoroughfare leading from Streatham Hill Station eastwards on hilly ground, was mainly erected in 1870 in the Early Decorated style. It consisted of a nave and side aisles, a square-ended chancel of some length, an organ chamber and vestry with a high-tiled roof with level ridge throughout, the whole being built of stock brick, with red brickwork and stone introduced in patterns and dressings. The church has been lately lengthened by the addition of two bays and baptistery from the designs of the architect, Mr. G. H. Fellowes Prynne. There is a slight projection made in the aisles at this end (to give increased width, and to be continued eastwards), beyond which are two porches giving access to the aisles, and a new baptistery of apsidal form semi-octagonal on plan. The baptistery and side porches, together with the new gable-end, form an agreeable termination towards the road. The gable end of nave has a wheel window and is flanked by low turrets and relieved by red brick diapering; the side aisles are finished by low horizontal walls, with pinnacles and flying buttresses abutting against the nave. In front project the apsidal baptistery, with hipped roof, and the porches; the south porch has a circular angle turret. Three-light windows and shafts of stone pierce each of the three sides of the baptistery; the interior shafts are detached. Only three lights, in the centre, are filled with stained glass, the gift of the vicar. These windows are intended to be filled with the nine orders of angels, the archangels now occupying the centre lights, executed by Messrs. Clayton and Bell. When completed, the entire series of windows will make a very effective interior. Below the baptistery is a meeting-room, lighted by a series of two-light windows traceried in the heads. The rapid fall of the ground at this end has given apparent height to the baptistery; two flights of steps give access to the porches. The interior has an arcade on each side of circular stone pillars, carrying stock brick arches of simple square members and dog-tooth ornament; the tympana and walls are relieved by patterns of red brick and bands and sills of stone, the lower part of aisle walls to the window sills being of red brickwork. There is no clerestory, the spaces between the arcading and the nave roof being partly adorned by frescoes of Scriptural subjects. The roof has arched ribbed principals, with collar and king and struts above, these being carried on short corbelled wall shafts of grey stone. The altar end is decorated by panels with mosaic figure subjects. Exteriorly the roofs are of red tiles, and the ridge line continued throughout. Messrs. J. and C. Bowyer, of Upper Norwood, are the builders.

The church of St. Andrew, Lower Streatham, designed by Messrs. Ernest George and Peto, is a building of unique character, built entirely of red brick with terracotta dressings. It has a nave, chancel, two aisles, organ chamber, and vestry with porch at the west end. The organ chamber is carried up and gabled, forming a transept externally. At one angle of it rises an octagonal turret of brick, with a pierced terracotta bell-cot and spire, some blind panelling in the same material being carried down below the base. The aisles are gabled longitudinally by a series of three gables, each having a four-light window of Perpendicular design, the mullions and tracery being of terracotta. The clerestory is pierced by a row of low, pointed traceried windows, and the roof is covered with red tiles. Internally there is an arcade of three arches on each side; the pillars are octagonal, but without capitals, the arch members dying away into the sides of octagon, the arcade being entirely of terracotta. Above are flat segmental pointed clerestory windows. The nave roof is of the hammer-beam type, with collar curved braces. The walls behind the altar are arranged in diapers of terracotta panels with relief ornament, and red brick; a mosaic picture representing the Lord's Supper forms part of the reredos. The flooring is of wood blocks, laid herringbone wise, and the seats are open benches of deal. On a brass plate let into one of the pillars is an inscription stating that the church was consecrated on Ascension Day, 1887, and was built by friends of the late Stenton Eardley, B.A., first incumbent of Immanuel Church, Streatham-Common. The nave and chancel are of the same width, and the roofing is level throughout, there being no internal arch or visible separation externally. There are few modern churches in the neighbourhood of London which presents so satisfactory an evidence of the practicability of uniting brick and terracotta without sacrificing character and detail. The window tracery, mouldings, and internal arcading are exceptionally true in line and sharper than ordinary stone would be. The architects have, we think, very judiciously obviated the stone capitals between the shafts and arches, and have indicated how well the continuous shaft and arch members suits the capability of the material. Horizontal impost mouldings are thereby avoided, and the springing blocks are moulded with accuracy. The design in its general grouping has a freshness and character of its own which might have been expected from the talented architects engaged.

In Streatham Park is a third church entirely of red brick, with few details of warm-coloured stone introduced, contrasting rather strongly in its severe plainness and monotony of colour with the previous edifices. Externally, St. Alban's is an unfinished church, consisting of a nave and aisles, with a temporary chancel. The style is plain Norman or Romanesque; the windows are two-light, circular headed, with Mansfield shafts in the jambs and sills, An unfinished tower at the south-east corner adjoining the chancel is at present surmounted by a wooden bell-turret, and is simply panelled in red brick round the upper stages. There are in all five bays, with porch at west end, and red tile roof. The cost has been about £6,288. Mr. E. H. Martineau is the architect. Relief here has only been attempted by the massing of the parts of the projecting piers which divide the bays and emphasise the angles. Another red brick church, St. Anselm, has been commenced; but here the more judicious plan of completing the chancel and transepts has been followed, the nave at present being nothing more than a galvanised-iron shed, with a huge "hopper"-like excrescence, or roof, against the western wall of nave, to shut off the chancel. Frightfully ugly the result of the temporary combination of iron and brick is now, and must lead to a speedy raising of the necessary funds for completion. One other church, though not a recent one, may be mentioned as a good example of the brick style representing some of the Italian or Lombardian features of Romanesque churches. We refer to Christ Church, leading out of Brixton-hill, designed by Mr. J. W. Wild, and consecrated in 1841. A severely plain gable end of low pitch pierced by a circular window faces the road, and a lofty bell-tower, which diminishes as it rises, equally severe in outline and majestically plain, stands at its side—recalling one of those campaniles which are so common in Italy. The only practical doubt as to the merit of the style as here shown is the exceeding smallness of the windows, which are mere slits in the walls.

SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY.

THE members of the Somersetshire Archæological and Natural History Society, in connection with their Bristol meeting, made an excursion last week through some of the most beautiful scenery in Gloucestershire. In the morning the party assembled at the Queen's Hotel, Clifton, where vehicles were waiting. The first place at which a stoppage was made was Westbury-on-Trym. The party having entered the church, Mr. J. Taylor read a paper which commenced by referring to the original grant of land in the parish and the subsequent bequests. He then passed on to dwell upon the connection of Westbury with the commencement of Benedictinism in England. In 1286 a successful attempt was made to convert the building at Westbury into a college of deans and canons. Precentor Venables, of Lincoln, followed with such a description of the church as he was able to give after a hasty survey. He said when they entered the church it seemed to be at once a building of the 15th century. All the windows were of the Perpendicular order, though windows were by no means an adequate index of the age of a church, as the windows were being continually altered, and the walls were often much earlier than the windows which pierced them. The church was an exceedingly shapely building of several different dates. He dared say there was a prior church to this on the spot; but the earliest part one saw was of the Early English style, probably before 1250. The whole of the south wall was Early English, and the western window of the south aisle was a triple lancet window of unequal height, which was a mark of the architecture of the 13th century. The sedilia and piscina were peculiarly interesting examples of the Early English style. He called special attention to the tomb of Bishop Carpenter, which was found in a mortuary chapel underneath the chancel, and he said that proved the chancel to be the work of Bishop Carpenter, who died in 1476. The tomb had been beautifully restored by the authorities of Oriel College, with which the Bishop was connected. After the church was quitted the party proceeded to the college, a 15th-century structure, at present converted into a dwelling-house. A drive to Henbury was varied by a stroll through the fields, the path leading by steps to the churchyard. The Rev. J. H. Way, the vicar, proved a ready guide to the church. He stated that the building had been unfortunately pulled about in 1830 and 1831, some large pillars taken down and Norman arches removed to give place to others put up in brick. The line of the chancel and the nave did not agree, as, though the chancel pointed east, the line of the nave was not in strict accordance. The reason of that discrepancy might be that the nave was first constructed and laid out somewhat at guess, and when, subsequently, the chancel came to be added, that portion was more carefully undertaken in order to insure accuracy. A few years ago Mr. Street was consulted, and under his direction the church had been carefully restored. The registers dated from the time of Henry VIII., and they might be examined in the vestry. A drive through Hallen brought the archæologists to the parish of Compton Greenfield, where they were welcomed by the rector, the Rev. G. Hope Dixon. Quitting the rector's residence, the party were shown over the church, which, if rather disappointing at the first glance, contains striking features. The principal feature is undoubtedly the fine Norman church at the entrance, the date of which is 1140. Rarely is so excellent an example to be met with, and fortunately it has not suffered at the hands of injudicious restorers. The rector said the church was restored in 1835 on the old lines, and then consisted simply of the nave and chancel without the transept. The tower, built of magnesian limestone found at Aust, was of the date 1360 or 1380. To Aust was a long but pleasant drive, and the party congregated under the cliff to hear some details, specially of the bone bed, from Professor Lloyd Morgan. The church at Aust, nearly a mile distant, was visited, the main object of interest here being a celebrated Elizabethan chalice. Memories of John Wycliffe have hallowed the church, and a key is now shown which he is supposed to have used in 1360. The Rev. Mr. Turner, the vicar, acted as guide in connection with the church. At Thornbury the party proceeded to the church, which they surveyed; they then went to the Castle, where Mr. E. Buckle read a description of the structure such as it was in the palmy days of the Duke of Buckingham. On their way back to Bristol the archæologists stopped at Almondsbury Hill, in order to enjoy the prospect.

Messrs. Herbert S. Wood, Herbert G. Lidstone, and H. V. Lanchester have been awarded the first, second, and third prizes respectively in the examination held in June last in connection with Mr. H. Lovegrove's lectures on "Construction" at the Architectural Association.

ST. ANNE AND THE VIRGIN.—ST. JOSEPH AND THE INFANT CHRIST.—CHRIST BEFORE HEROD.—NEW OFFICES OF THE "EAST ANGLIAN DAILY TIMES."—SIDEBOARD FOR A HOUSE AT HAMPSTEAD.—LIBRARY, BONALLY TOWER.—NEW CHURCH AT STRATTON.—SKETCHES AT THE HOME ARTS ASSOCIATION.—BEDROOM FURNITURE BY MESSRS. JENKS AND WOOD.

OUR LITHOGRAPHIC ILLUSTRATIONS.

ST. ANNE AND THE VIRGIN, AND ST. JOSEPH AND THE INFANT CHRIST.

THESE are two more examples by Carl Müller, of whose Scriptural subjects we have already given one or two reproductions which seem to have found favour. We shall give another in a few weeks, of "The Repose in Egypt," by the same painter.

CHRIST BEFORE HEROD.

WE have recently referred at such length to this panel as to render it unnecessary to say more now. We congratulate Mr. Tinworth on the accomplishment of what is in many respects his best work, and Messrs. Doulton and Co. on its successful completion.

"EAST ANGLIAN DAILY TIMES" OFFICES, IPSWICH.

THE new publishing office and printing works of the *East Anglian Daily Times* are at the corner of Carr-street and Little Colman-street, Ipswich. The premises, necessitated by the growth and the continuing success of the paper, are two doors west of those occupied for the past thirteen years by the same newspaper publishers, and occupy the site of a 17th-century residence and garden, the area being an irregular oblong 150ft. in depth, with a width increasing from 43ft. on the Carr-street frontage to 76ft. at the rear. The style adopted for the new buildings by the architect, Mr. Thos. W. Cotman, M.S.A., of Northgate-street, Ipswich, is a free rendering of Renaissance of the latter portion of the 16th century, with a large use of Flemish details—a treatment peculiarly appropriate in Ipswich from historical associations. The buildings are in two distinct but adjoining blocks, the principal or publishing department being placed in Carr-street, part of the main thoroughfare through the town, and its main and return façades are marked by greater richness and elaboration of handling than is the block devoted to printing, which forms the chief part of the Little Colman-street front. Red Suffolk bricks are employed for facing the street elevations, Dutch bricks being introduced for carved work and for outlines of gables; the latter bricks were specially imported for this work for these premises and Mr. Felix Cobbold's residence at Felixstowe, and are 8in. by 4in. by 2in., of a deep red colour and considerable weight. The roofs are covered with Broseley tiles. At the angle of the two streets the building is canted off on the ground floor, and the entrance doorway is placed here. A semi-octagonal turret is carried over on a corbel of red Dumfries stone, and rises two stories in height, being capped above a frieze of carved brickwork and brick coving by a steep-pitched roof covered with copper scales; the height to the weather-cock is 52ft. Over a second entrance to the publishing-office, nearly in the centre of the Carr-street front, is a projecting balcony carried on carved stone consoles, with wrought-iron railing. The windows of both stories of the publishing department have square heads set under projecting hood moulds, the tympana being filled with masks and foliage in cut brickwork; and above a deep frieze, treated in the same manner, are gabled dormers, having scroll outlines. The printing department block, treated more simply, is covered by a separate and higher roof. Beyond this block, which has a frontage of 70ft., is the workmen's and cart entrance. At the further angle of the site a circular red brick shaft rises 90ft. high, and adjoining are cart sheds and stables for the outdoor news trade. The ground floor of the business department is arranged as an advertisement office, at the angle of streets, 36ft. by 18ft. in clear, with manager's room behind; and to the right is the editor's room, which is still fitted up with the 17th-century oak-panelling from the old merchant's house which formerly occupied the site, and behind this is the file-room. Beyond the manager's room in Little Colman-street is the wholesale publishing office, with sorting, packing, and strong rooms behind, and to the north of these is the machine-room, which is 60ft. by 30ft., containing two Wharfedales and folding-machines, each erected on separate beds of solid brickwork. At the back, on a lower level, are the engine and boiler-rooms, and in the basement are damping-room, stock-room, heating chamber and electric-dynamo store. At the rear of premises is an irregular L-shaped room, averaging 60ft. by 14ft., used for general printing. The first floor contains in the front block a second editor's room, sub-editor's, chief and assistant reporters', and readers' rooms and lavatory. The sub-editor's and reader's rooms are placed at the back, and communicate by serving hatches with the composing room. This measures 67ft. 3in. by 28ft. 6in. in the clear, and is lighted by a range of eight square-headed windows along the east side, and by a semicircular headed window 8ft. across and 8ft. high in centre in each gable. The lower part of internal walls are faced with a dado of glazed bricks, and the upper part with white Chiltons. The roof is open to level of purlins, each set of principals consisting of a tiebeam carrying queenposts and diagonal straining pieces; the half-ceiling is of pitch-pine, perforated in decorative panels. On the eastern side of room, exactly opposite and adjoining each window, is a compositor's frame, fitted on either side for three men, accommodation being thus provided by the eight double frames for 48 compositors, and the imposing tables are placed on the western side of the room. In the centre of this western wall is one of Messrs. R. Waygood and Co.'s patent lifts communicating with the machine-room. At the north end of room is a long desk for the overseer, just behind which a sliding hatch opens directly into a sub-editor's room; while a similar hatch from the readers' closet faces the galley-press on which proofs are pulled. At the north end of room are provided steam-jet and water supply for washing type, and beyond are the lavatory and compositors' staircase and entrance from Little Colman-street. All the rooms are heated by hot-water pipes, and lighted by a duplicate system of gas and incandescent lights. Messrs. George Grimwood and Sons, of Sudbury and Ipswich, were the contractors; and Mr. Harry Cockrell acted as clerk of works. The carving has been executed by Mr. Knox, of Peckham, S.E.

SIDEBOARD FOR A HOUSE AT HAMPSTEAD.

THIS Sideboard was designed *en suite* with some furniture for a dining-room for a house at Hampstead. It is of walnut, the side projecting cupboard doors being filled with lead glazing, the centres being of bevelled glass, and the leadwork gilt. Behind the balusters to the top cupboards silvered glass is placed. The sideboard was designed by Mr. R. A. Briggs, A.R.I.B.A., of 2, Devonshire-square, E.C.

LIBRARY, BONALLY TOWN, MID-LOTHIAN.

THIS room forms part of a new wing which has just been added to this picturesque old mansion which was long the residence of Lord Cockburn, a famous Scottish judge. The ceiling and bookcases are of wainscot, and the fireplace is a replica of that which was lately destroyed in the Hall of the Knights Templar at Linlithgow. The two circular turrets and the deep ingle nook form cheerful and pleasant features in the room, and give it a comfortable and homely air. The architect is Mr. Sydney Mitchell, Edinburgh.

NEW CHURCH AT STRATTON.

THE new church now being built from Mr. Jackson's design at Stratton, in Hampshire, is to supersede a very mean modern structure of brick which stands on low ground in Stratton Park. The new church, which is being erected at the expense of the Earl of Northbrook and the Hon. Francis Baring, is situated on higher ground nearer the village. The materials are brick, with flint facing and dressings of Chilmark stone externally and of chalk internally. The spire is of timber and shingled. The seats and other fittings are to be of oak throughout. The contractors for the general work are Messrs. Parnell and Son, of Rugby, and Mr. Evans is clerk of the works.

SKETCHES AT THE HOME ARTS ASSOCIATION.

SINCE last year the above Association has greatly improved both in quality of work, quantity of work, and an increase of the number of teaching centres. We illustrate a few sketches made from the annual exhibition. This we noticed in our issue of June 17, so it will be only necessary to say a few words about the articles illustrated. The White Mantel was made by the Ashridge Class, and has been purchased by the Countess Brownlow for £10 10s. The Chest of Drawers was made at Corstorphine, a Scotch class. It was of oak, well carved, and yet not too much ornamentation on it. The little Screen was stained green, and we hope the Home Arts Association will be able to make the colour permanent, as, unless a very strong acid be used, the colour is not at all permanent, and when faded looks very queer indeed. The other works, Inkstand, Bellows, &c., are, we think, copied from old examples.

BEDROOM FURNITURE BY MESSRS. JENKS AND WOOD.

THE sheet of Bedroom Furniture illustrated this week is of a Georgian character, and an agreeable effect has been obtained by the application of Tynecastle Tapestry to the panels and friezes, which are thus enriched in low relief. The furniture is all of pine, painted and varnished, and consists of a Wardrobe of pleasing design, with a pediment over, with rounded ends and an arcaded recess in the centre. The kneehole Toilet Table has fixed glass, and cupboards over; the kneehole Washstand has a marble top and tilted back. There is also a Towel-horse, beside Table and Rush-bottom Chairs.

COMPETITIONS.

VICTORIA HOSPITAL FOR SICK CHILDREN, HULL.—The design submitted by Mr. Samuel Musgrave, F.R.I.B.A., of Trinity House-lane, Hull, has been selected for this building; premiums of £15 and £10 respectively being awarded to Messrs. Botterill, Son, and Bilson, and Messrs. Smith and Brodrick, of the same town.

A memorial to the late Charles Longuet Higgins, of Turvey Abbey, has been set up in the chancel of Turvey Church. Two sculptured angels are represented sitting at either extremity of a tomb (with reference to the Evangelical record in St. John xx. 12), surmounted by branches of palms. Above the tomb, within a circle, is a cross between the Alpha and Omega. Beneath is the Greek monogram of the name of Christ. This memorial, which is executed in Carrara marble, is inclosed in a frame of carved alabaster, carved at the summit, the background being constructed of blue Venetian mosaic. The sculptor is Mr. H. H Armstead, R.A.

WAYSIDE NOTES.

HE proposed alteration of the steps to the portico of St. Martin's Church really seems e wholly uncalled for, as those persons who best able to judge state that there has been ıerto little or no congestion of traffic at the ıt in question. Why not, then, let the evil ufficient to the day thereof? Such a proling would savour nothing of procrastina-. If the roadway is sufficiently wide why r it? Meanwhile, perhaps some ingenious ıkee, skilled in the art of wholesale building ıovals, will come along and bodily set the lding back a few yards!

ooking northward up the east side of Tra-ar-square it certainly seems as if the end of National Gallery is the greatest offender, as rojects infinitely more into the line of road- than does the church. It is sincerely to ıoped that for the present sufficient room l be obtained by setting back the railings at end of the gallery. The inexorable law of survival of the fittest must ultimately solve problem. The National Gallery may be St. Martin's Church may be fitter; but the ving tide of humanity is the fittest.

n Saturday last, I believe, the Architectural ociation visited a number of new churches he south of London—with much advantage, us hope, to its members. Messrs. Ernest rge and Peto's church is well worth seeing, the names of the architects of the other ldings visited by the A.A. should warrant d work. The Society of Architects recently ted two excellent churches in the west of ıdon; and any persons who accompanied h bodies should have somewhat increased ir knowledge of modern ecclesiastical architure.

t is curious that so many of our modern ırches are dubbed, by the public, as "barn-e." Such an impression would appear to lom disturb the equanimity of the profes-ıal. Nevertheless, the charge is often war-ıted. Doubtless, the want of sufficient money en renders our modern churches so bare and l looking, though no skilful architect can rly plead limited means as an excuse for an interesting building. Where simplicity in nposition is the result of affectation it is tainly despicable, and must be distinctly ot apart from noble simplicity—the un-ected composition that one may often find in village church, where the old builders dently went about things in a purely nmon-sense manner, building what they nted, hiding nothing, and affecting nothing. long as they were honest and true, if there s often merely negative beauty, there was ver positive ugliness.

Such an old church I had the pleasure of exining a few weeks back. I can almost see in imagination as I write, rising from the ensward, with its grey mass relieved against blue sky and fleecy clouds. It is an example that common-sense composition which not y suffers nothing to stand in the way of the ctical uses of the building, and hesitates ver to adopt any plan so long as it be but fit l true, but also turns such incidental features o objects of beauty, often lavishing more ention on their decoration than on the other rtions of the design.

It is rather a pity that we do not get more urches in a Later style of Gothic. We all te Early English; but we should possibly ost of us find a little variety in style de-ledly charming. The 15th-century period, it has its blemishes, has also very ıny redeeming features. The style has been ndemned as exhibiting "liny" mouldings d carvings. But there is no need to make em liny now. One sees, too, plenty of old Per-ndicular work that is as intrinsically beauti-l as is the work of any other period. How ıny a dull, plain, Early church is redeemed m tameness of interest by the addition of ne feature or another in all the quaintness its piquant 15th-century proportions!

It could hardly be expected that the old bey would altogether escape damage by the rations of stand-making for the Jubilee ebrations. I have not had an opportunity to examine the building, but note a letter from Mr. E. H. Walters to an evening contemporary, stating the amount of injury that, in his opinion, has been done to the venerable structure. The Coronation Chair is said to have assumed a murky colour, and the remains of its 14th century decorations that were executed in gilded gesso have been utterly obliterated. The "chair," moreover, has acquired an odour of French polish. Further, an old stained-glass window in the apse is said to have had a hole knocked in it; the stonework of the church chipped in several places; the effigy of the Countess of Lancaster roughly used; and lastly, but none the less regrettable, Abbot Ware's Italian mosaic pavement has suffered—it is said by workmen throwing down heavy tools.

The so-called restoration of Westminster Hall proceeds apace. The new stonework already rears itself above the hoarding. Whether the additions now being made are warranted by facts or not, the building will apparently prove an excellent piece of Modern Gothic, judging by what can be seen of the work from the public highway.

We may expect to hear that the death-warrant of the Mayor's Chapel at Bristol has been duly signed before long. The members of the A.A., who join the annual tour, should take advantage of the last opportunity to inspect and sketch this interesting old edifice.

The Earl of Milltown seems to be determined to do all that is possible to rescue the old relics of Burlington House colonnades in Battersea Park. Last Monday the noble earl again drew the attention of the Government to the stones on the riverside. It is difficult to even hazard a guess at the ultimate destination of the remains of the old colonnades. Something in connection with the Jubilee is the only suggestion I can make. The idea is so original!

I hear that it is probable that the Betchworth tunnel will be done away with, and a cutting substituted, as the owner of the park under which the L. B. and S. C. Railway runs has given permission for the alteration to be made. It is to be concluded that the exceptionally dry weather must have caused the subsidence of earth—possibly by weakening the natural abutments to the brickwork of the tunnel, the arch of which, under the circumstances, would burst at the weakest points.

Anyhow, it is fortunate that no train was in the tunnel at the time of the accident, as the result must in that case have proved disastrous. A falling body brings ruin in its train. A fall *on to* mother earth, however, seems a much less risky adventure. There have lately been some marvellous escapes from death and injury by falling. A few days back a man fell from the Brooklyn Bridge in New York to the river beneath, and "did not complain of any serious hurt." The most curious case, however, is perhaps that of a recent accident at the flour mills in Bexley, Kent. A man engaged in repairing the chimney-shaft, fell from the top, a distance of about 60 or 70ft., *through a slate roof*, and alighting on some sacks of flour, is now fast recovering from the mishap!

One cannot but admire the iron nerve of "steeple-jacks." And real nerve they must have, since no false courage or bravado will take a man safely to the summit of a lofty spire or chimney, whence the houses look flat on the earth, the men appear like bees upon the ground, and the very hum of the city below is hushed. Nothing is more calculated to inspire a feeling of admiration for the bold though pious confidence of the Mediæval builders, than to climb a few of their more daringly constructed open-work spires to be found on the Continent. Some of this comparative child-play is risky to the nervous. But how can we compare such a position to that of a man hanging on by a few nails to the almost perpendicular face of the spire. Still, it may be objected, I am giving too much credit to the steeple-jack, as it is "their trade," and there is nothing much in it. Perhaps so, though they do say that if an architect ever neglects any part of his duties, it is the being hauled up by ropes to inspect the top of a tall factory chimney.

GOTH.

BUILDING MATERIALS.*

By W. Y. DENT, F.C.S., F.I.C.

THE term "Building Materials" embraces so wide and comprehensive a subject, that it may be well to make some explanatory remarks as to the nature of the information that is intended to be conveyed regarding the several matters to which I propose to direct your attention. As regards one of the most important of these, stone, it will be my endeavour to point out, as far as possible, the differences which exist in the composition of the principal descriptions used for constructive purposes; and the properties which stone should possess to enable it to resist the action of those influences which tend to bring about its disintegration and decay. Your attention will be directed to the nature of the proposals that have been made from time to time for the preservation of stone, and to the results that have been attained as regards the manufacture of what may be regarded as coming under the designation of artificial stone. With respect to limes and cements, I hope to be able to afford some information as regards their respective constituents, the processes adopted in their preparation and manufacture, and the advance that has been made in the improvement of such processes during the last thirty years, and also to introduce to your notice some rather novel applications of the most important of all the different varieties of cements, generally known under the name of "Portland." As regards wood, I shall confine myself to the question of its preservation from decay, and to a description of the various processes that have been adopted to increase its durability, and enable it to resist the attacks of the teredo and other boring worms. Lastly, in connection with the subject of paints, I shall have a few remarks to make as to the nature and composition of some of those that constitute the basis of that vast and ever-increasing number used for the preservation of wood and iron, which are continually being forced upon the attention of the public. It is well known that although the differences which exist in the character and behaviour of various substances may for the most part be generally attributed to diversities in their composition, as determined by chemical analysis, yet in many cases these differences are due simply to changes in their molecular structure. It is necessary to remind you of this fact in connection with such a material as stone, because the value and quality of stone depend quite as much, or even more, upon its physical structure than upon its chemical composition. I may recall to your recollection a few familiar examples of important changes being effected in the behaviour and character of a substance without such changes being accompanied by any alteration in the proportion of its chemical constituents. By subjecting starch to a temperature of 400° Fahr. it is converted into dextrin, or British gum (as it is sometimes called), a substance differing in its physical properties, but having precisely the same elementary constituents as the original starch, the proportions of carbon, hydrogen, and oxygen remaining unaltered. The change which takes place in the starch is caused by an alteration, produced by exposure to this temperature, in the molecular arrangement of its component particles. We have another example of a similar kind in phosphorus, which, under ordinary conditions, takes fire on exposure to air, and is readily soluble in carbon disulphide; but when exposed in an atmosphere of carbonic acid or other gas that exerts no chemical action upon it, to a temperature of 460° Fahr., it assumes what is called an allotropic modification, in which form, under the name of amorphous or red phosphorus, or Schrötter's phosphorus, it is no longer acted upon by the liquid in which it previously dissolved, nor does it take fire when exposed to the air, and is thus converted into a material suitable for the manufacture of matches. Zinc is a metal which exhibits very marked changes when exposed to the influence of variations of temperature. As ordinary spelter it is brittle; by exposure to a temperature of from 250° to 300° Fahr., it becomes malleable, and advantage is taken of this change to obtain the metal in a suitable con-

* Being the Cantor lectures delivered before the Society of Arts.

dition for rolling into sheets; whilst if the temperature be raised to 410° Fahr. it becomes so brittle as to be capable of being powdered. The differences which exist in the quality of iron and steel are also, as is well known, not unfrequently due to the physical structure and not to the chemical constitution of the metal. With respect to stone, we have in chalk and marble the same chemical substance, carbonate of lime, but existing under different physical conditions. Before, however, entering upon the question of the structure and composition of building stone, it may be well that we should fully understand the nature of the influences to which it is liable to be exposed, whether such influences are derived from the atmosphere under ordinary conditions, or from the more or less vitiated air of populous cities or manufacturing towns. The subject of building stone is one that nearly 30 years ago excited a great deal of public attention, owing to the alarming reports that were then spread about as to the lamentable condition of the stone used in the then newly-erected Houses of Parliament at Westminster. In a leading article of a scientific journal of that time the following statement was made with reference to the condition of the building: "In a century it will be—but we must not attempt to prophesy what it will be, for the probabilities are rather it will have ceased to be altogether." The excitement, however, gradually passed away as it became evident that the decay was confined to comparatively small portions of the structure, and that, at all events, the building was not likely to fall to pieces during the present century. The alarm, however, produced at least one good result, inasmuch as it led to an investigation into the nature of the stone, from which much useful information was derived upon a subject respecting which but little had been previously generally known. The records of the history of our globe afford evidence that the vast changes that have taken place at different periods, although frequently resulting from some sudden and violent convulsion, have been more generally due to the slow, gradual, but continuous action of natural forces over vast periods of time. In order to understand the cause of decay in stone, it is necessary that we should know something respecting the character and mode of action of the forces arising from atmospheric and climatic changes which exert their influence on everything around us, the immediate effects of which are apparently very feeble as compared with the magnitude of the results which they are ultimately capable of effecting. These forces are partly of a mechanical and partly of a chemical nature. The former chiefly consist of those which result from the action of water which, with slow but certain progress, effects by its persistency changes so vast as to have no slight influence on the structure of the globe. That the hardest rocks will yield at length to the action of running water, their surfaces becoming rounded off by simple friction, is so well known as to have become proverbial. Besides the results produced by friction, water exerts a force of a most powerful disruptive tendency by the expansion which it undergoes in the act of solidifying or conversion into ice, of which fact some of us have probably been forcibly reminded during the winter season in a manner not conducive to our comfort by the bursting of our water-pipes, unless the necessary precautions had been taken to allow space for the increase in volume resulting from the freezing of the water. The effects produced by frost in detaching large fragments, and sometimes very considerable masses, may be observed on any exposed surface of the softer rocks, and can scarcely fail to have attracted the attention of those who are in the habit of searching for fossils in the soft and friable cliffs of the Lias formation. It is, however, in mountainous districts that we can best appreciate the enormous disruptive force that is produced from apparently so simple a cause, and the important part which water plays in the breaking up of the older rocks, and in the formation of sedimentary deposits resulting from their disintegration. All rocks are more or less traversed by natural joints and minute crevices into which water finds its way, and these, by the repeated expansion of the water in its conversion into ice, are gradually enlarged into fissures, until finally the detachment of pieces from the mass is effected. The weather-worn blocks which so frequently attract our attention, more especially in granite districts, from the curious and remarkable shapes which they assume, some of them being so evenly balanced as to form "logan" or logging stones, owe their peculiar appearance to the wearing away of those portions of the rock that are most easily acted upon by exposure to the influence of air and moisture. The effects produced by the action of the weather, combined with the mechanical force of the waves, are so great as to produce very considerable erosion of the English coast. Going back no farther than the year 1813, we find by the Ordnance map that there were then standing at Langley, near Beachy Head, four martello towers which were at that time all above high-water mark; these have since all been destroyed by the advancing waves, the ruins of two of them being still visible at half tide. Within a period of a few hundred years, the sites of former villages and farms have been covered by the sea, of which the old town of Cromer is an instance, and the rate at which the waves advance at several portions of the coast line has been estimated at two yards per annum. How little regard is generally paid to this coast erosion is shown by the fact that at a spot not far from Folkestone, upon which the sea is steadily encroaching, might have been seen, a short time ago, an advertisement board drawing the attention of the public to the excellency of the situation as a site for building purposes. Water, as we are aware, possesses very great solvent powers, but possibly we should scarcely be prepared to learn that the solid matter annually carried off in solution is estimated to amount in some districts to as much as 140 tons from a square mile of surface. The chemical changes effected by water are, to a great extent, due to the air which it holds in solution, and to the various accidental impurities it contains. The air in its normal condition consists of nearly 21 volumes of oxygen and rather more than 79 volumes of nitrogen, together with small but variable quantities of carbonic acid. From experiments made a short time ago by Dr. Russell, it appears that the purest country air contains about three volumes of carbonic acid in 10,000 volumes of air, and that on a fine summer day in the City of London the proportion will not be increased beyond four volumes; but on a still, foggy day it is much greater, and may be increased to ten volumes, whilst, in some cases, as much as fourteen volumes have been found in a dense and long-continued fog. The impurities usually contained in a town atmosphere, such as sulphates and chlorides, are also largely increased in a foggy atmosphere. The constituents of air are, however, dissolved in water as separate gases, and hence we find that the air contained in water differs materially in its composition from that of ordinary atmospheric air, the proportion of oxygen being increased from 21 volumes per cent. to nearly 34 per cent., whilst the proportion of carbonic acid is increased to a much greater extent. It is evident that such air must have enlarged powers of oxidation, and be much more capable of bringing about other chemical changes, of which we have an example in the extraordinary powers exhibited by river water in oxidising the organic matters with which it is polluted. The effects produced by moisture upon some descriptions of shale, such as alum shales containing large quantities of sulphur as sulphide of iron, afford a striking example of the action of water as a carrier of oxygen. When shales of this description are piled up in heaps, and moistened, combination of the sulphur with the oxygen contained by the water takes place, and the heat developed by the chemical action thus commenced is sufficient to produce, in many cases, disintegration throughout the mass. The oxidising power of the air is also influenced by the small quantities of nitric acid and ozone generally present, which, although never very large in amount, are greater at periods of electrical disturbance. Ozone may be regarded as a condensed form of oxygen. It is oxygen in an allotropic condition, in which form it possesses greatly increased chemical activity, ozone surpassing ordinary oxygen in this respect just as oxygen does atmospheric air, possessing the power of bleaching substances, such as indigo or vulcanised rubber, that withstand the influence of ordinary oxygen. Ozone may be recognised by its peculiar odour, which is frequently observable in working an ordinary electrical machine, and its presence in the atmosphere is detected by means of test papers dipped in a solution of potassium iodide and starch. The iodide is decomposed by the ozone, and the liberated iodine, coming into contact with the starch, strikes the well-known blue colour indicative of the presence of iodine. Ozone may be produced by means of a generator, which is made on the principle of a Leyden jar, consisting of a long glass tube, coated with tinfoil on the inside and surrounded by another tube similarly coated on the outside. Through the space between the two tubes, a current of dry air or oxygen is passed, which becomes converted into ozone on connecting the inner and outer tinfoil coatings with the terminals of an electrical induction coil. The condensation which oxygen undergoes by its conversion into ozone is considerable, three volumes of oxygen being condensed into two volumes of ozone. When ozone is exposed to a temperature of from 300° to 400° Fahr., it expands to its original bulk, and resumes the condition of ordinary oxygen. Water penetrating as it does all rocks to a greater or less extent in proportion to their porosity, is thus the means of bringing about great and very important changes which are included under the general term "weathering." The effects produced by rain in its passage through rocks are generally the results of oxidation, converting sulphides into sulphates, and ferrous into ferric salts or into peroxide of iron; the oxidation of salts of iron are the most striking on account of the change of colour which they undergo. Water, however, owing to the organic matter which it takes up in its passage through the ground, sometimes exerts a reducing action, and the results produced are reversed. Gypsum or calcium sulphate is thus converted by the reducing effect of the organic matter into calcium sulphide, which is readily decomposed into calcium carbonate and sulphuretted hydrogen, the latter, by oxidation, yielding sulphur, and thus giving rise to deposits of limestone and sulphur. This reducing action of water may also be observed in the white spots and veins which sometimes occur in red sandstones. The observations of Professor Geikie on the effects produced by this weathering upon the gravestones in some of the older burying grounds of Edinburgh are very interesting and instructive. Some of these tombstones are composed of limestone, others of granite and sandstone. In many of those composed of granite traces of decay in some of the felspar crystals were detected, the polished surface having become gradually roughened, as the individual crystals had been more or less easily attacked. Some of the sandstones have proved to be remarkably durable, and seem in some instances likely to resist the ravages of time for a longer period than the granite. On a sandstone in Grey Friars churchyard the chisel marks are still distinguishable, after the lapse of 200 years, the letters of the inscription upon it remaining sharp and distinct, the only observable change consisting of a roughening of the surface of the stone on the sides most exposed to wind and rain. Sandstones possessing distinct lines of stratification exhibited a tendency to split up along those lines under the influence of the weather, and in one instance of a flagstone set on edge, although the lettering of the inscription remained sharp, yet in the short space of forty years large portions of the stone had scaled off, affording a striking example of the necessity of attending to the well-known rule that stones should be laid on their natural bedding. Many of the marble monuments had undergone considerable decay; irregular channels had been worn, partly dependent for the direction they had taken upon the trickling rain, and partly on the form of the monumental carving, or on differences in the structure of the marble. The surface of one marble obelisk had, in the short period of sixteen years, become so rough and granular that it might readily have been mistaken for sandstone. The extent to which these alterations had taken place depended upon the position of the stone as regards exposure to rain and to the prevailing winds. In one instance the marble had been dissolved away to the depth of a quarter of an inch, the inscription having become illegible, although the stone had not been erected for more than eighty years. The

inscription on the tombstone of Professor Black, in which his friends record the genius of the discoverer of latent heat and carbonic acid, has become partially illegible, and we may be sure that it never entered into their minds when expressing a wish to mark the resting place of the distinguished Professor "by the marble whilst it should last" how short a period would be sufficient to show to what an extent their confidence had been misplaced. The experiments conducted by Professor Pfaff, of Erlangen, led him to the conclusion that the annual loss of granite and syenite might be estimated at about ·008 millimètres in thickness, and that of limestone at ·013 millimètres, the limestone experimented upon being the hard Solenhofen limestone near Munich, used for lithographic purposes. Those rocks which contain iron not in the condition of peroxide afford marked examples of the effects produced by this so-called "weathering process" on account of the changes in colour which they frequently undergo; thus, *e.g.*, the light coloured spathic iron ore from Alston Moor in Cumberland, and from the Brendon Hills in Somersetshire, is often more or less converted from a light-coloured carbonate of the protoxide of iron into a brown peroxide. Now any alteration of form by the oxidation of iron must obviously tend to disintegrate and break up the mass in which such alterations occur, and hence the presence of iron in a condition in which it is liable to oxidation is often a source of weakness. The presence of iron pyrites in slates when not in the form of cubical crystals) is considered to be detrimental to their value. Iron pyrites is most familiar to us in the form of cubical crystals of a golden yellow, but it also occurs in rhombic prisms of a paler colour, as marcasite, and in radiated nodules which are more liable to decomposition, specimens of which in cabinet collections may often be observed to break up and fall to powder. The oxidation of metallic iron, or rusting, as it is generally termed, is not quite so simple a process as might at first sight appear to be the case. It is not simply the result of the direct combination of iron with oxygen. Iron will remain bright in dry oxygen for an indefinite period of time, whilst we are only too familiar with the fact that iron rusts very rapidly when exposed to air under ordinary circumstances.

(*To be continued.*)

ARCHITECTURAL ASSOCIATION EXCURSION, WILTS, 1887.

THE following is the official programme just issued to members. The president, Mr. Slater, B.A., F.R.I.B.A., will generally conduct the excursion, and will be assisted on Monday by Messrs. J. A. Gotch and Wallace Hill, on Wednesday by Messrs. C. Adye and Gotch, on Thursday by Mr. J. D. Sedding, and on Saturday by Mr. James Fowler, who will describe Bath Abbey:—

Monday, Aug. 15.—Claverton (Terraces and Church), Hinton Abbey (Monastery and House), Hinton Charterhouse (Church), Farleigh Castle, Norton St. Philip (Inn, Farm House, and Church), Wellow (Church, Old House).

Tuesday, Aug. 16.—Cheney Court Manor House, Corsham (Mansion, Church, and Almshouses), Lacock.

Wednesday, Aug. 17.—South Wraxhall (Manor and Church), Bradford-on-Avon (Bridge), Westwood.

Thursday, Aug. 18.—Chalfield Magna (Manor House, Church), Steeple Aston (Church), Seevil (House), Edington (Church), Westbury Church).

Friday, Aug. 19.—Hamswell (Manor House), Marshfield (Church, &c.), Cold Ashton (Church and Manor House), St. Catherine (Church, Manor House, &c.) Final dinner.

Saturday, Aug. 20.—Bath: Prior Park will be visited by special permission, and the Bath Royal Literary and Scientific Institution have placed their library, writing rooms, and museum at the disposal of members during the excursion.

The mayoress of Sheffield (Lady Stephenson) on Bank Holiday laid the foundation stone of new Sunday-schools, &c., at Carbrook, of which Mr. J. Innocent, of Sheffield, is the architect.

Building Intelligence.

CARLISLE.—Mr. H. Higginson, M.S.A., architect, whose plans of a Unitarian church and school were recently selected in a limited competition, has now received instructions to proceed with the working drawings of same. The site, which is a very awkward one, has a rounded corner of 50ft. radius at the junction of James-street to Victoria Viaduct; but the difference in levels between Victoria Viaduct and the original allows of the church being placed on the viaduct level with the school below. The difficulty of the site has, however, been overcome by stepping back the walls of main building and forming a triangular porch (with curved front), which is surmounted by a circular turret; this turret forms one of the principal features in the elevation. The style may be termed Modernised Romanesque. The walls will be faced with local red stone, relieved with glazed tiles or faïence ware of a rather sombre tint, and the roofs will be covered with slates. Accommodation will be provided for 210 persons, with children and choir galleries. The internal fittings throughout will be of pitch-pine. Convenient entrances and exits to both church and school will be provided from the viaduct level. The cost will be about £1,800.

EDGEHILL.—The foundation-stone of the new chancel and transepts of St. Anne's Roman Catholic Benedictine Church, Edgehill, was laid on Sunday last. The architect is Mr. Peter Paul Pugin, the builder Mr. Urmston, the clerk of works Mr. Michael Shanley. The additions comprise one additional bay to the nave, chancel, three side chapels, priests' and choristers' sacristy, with cloister connecting the latter with the transepts. The total additional length to the church will be 62ft., and the width across transepts will be 104ft. The additional accommodation formed will be about 440 sittings. The material used will be Runcorn stone for the dressings, and Woolton for the facings.

KIRKHAM.—Memorial stones of a Wesleyan school were laid recently. The building is Early Gothic in style, and consists of a schoolroom 50ft. by 30ft., with three classrooms and a heating-chamber in the rear. The wall are of local bricks with stone dressings, and the roofs are covered with slates. The cost will be about £750 complete, including internal fittings and heating apparatus. The architect is Mr. H. Higginson, M.S.A., Carlisle and Preston, whose plans were selected in a limited competition, and the builder is Mr. J. Haslam, Kirkham.

LOSTWITHIEL.—The Home of Mercy stands upon rising ground over and above this pretty Cornish town, and commands a superb view. It was built full 20 years ago from the designs of the late Mr. George Edmund Street, R.A., and attached to it is a handsome chapel dedicated to St. Faith. Some few years ago a special gift was made to this chapel in the shape of a fine reredos in polished alabaster and marbles, designed by Mr. R. Medley Fulford, F.R.I.B.A., architect, of Exeter, and made by Mr. Harry Hems, sculptor, of the same city. Additions to this reredos have just been made at either side. Niches have been placed in the east wall, within which stand life-sized statues of St. Peter and St. Paul respectively. They are set upon corbels held up by angels. The canopies are delicately groined, and terminate with lofty crocketted spires. The new work, like the surroundings, is of Early Character, designed by Mr. Fulford, and carried out in its entirety by Mr. Harry Hems.

NEWICK.—The work of restoring and enlarging the parish church of Newick is now so far completed that the reconsecration by the Bishop of Chichester took place on Friday week. The edifice has been in the builder's hands since the 4th of May of last year. Mr. John Oldrid Scott, F.S.A., was the architect. Both internally and externally the old portion of the nave has been carefully restored, and the windows and doorways left as formerly. The heavy arches, built in 1834 between the nave and aisle, with the massive square pillar, have been removed, and now there are four arches, with pillars of a much lighter character, offering far less obstruction to sight and sound. There are also double arches in the north wall of the chancel as well as the east end of the aisle. A feature of the building is the noble east window of the chancel, its handsome tracery taking the place of the temporary wooden frame. The sedilia and piscina, which were somewhat mutilated, have been restored and refixed to the same position in the chancel. Turning to the north aisle, we find its western gable considerably improved architecturally, as besides being now capped by a handsome coping and surmounted by an elaborate cross, a three-light window has been inserted in the place of the small single light. The tower (formerly covered with whitewash) has been renovated, the whitewash being cleaned off, the stones cleaned and pointed, and a new oak ceiling, divided into panels with oaken beams and resting on moulded stone corbels, has taken the place of the former ceiling of lath and plaster. The floor of the church is laid with wood-block flooring. The church formerly accommodated about 280, now there are sittings for 371. The old Jacobean pulpit with the sounding board forms a very pretty feature. The latter had been laid aside for some years past, but it is now replaced, both pulpit and sounding board having been thoroughly restored and renovated. The old altar rail has been readapted to the present requirements, and the reredos has also been retained, and now forms a partition between the vestries and the organ chamber. The external doorways have been lowered to their original levels, and although this has necessitated the lowering of the adjacent paths to a corresponding depth, it considerably improves the appearance of the building by going down to its original ground line.

PENDLETON.—On Friday St. Barnabas Church, Pendleton, was consecrated by Dr. Moorhouse, Bishop of Manchester. In the construction, brick and terracotta have been used with stone only where absolutely necessary. The church is of simple detail, but substantial throughout, and the contract has been ably carried out by Messrs. W. Southern and Sons, from the designs and under the superintendence of W. K. Booth, architect and surveyor, of Manchester. The cost incurred is under £3,500, and the accommodation provides 516 sittings.

STROUD GREEN.—The Stroud Green High School for Girls was opened on Tuesday, the 26th of July. The elevations of the new buildings are an adaptation of Queen Anne. The walls are of yellow bricks, with red dressings and arches, relieved with a light brown stone from the Newbiggen quarries, and the gables are finished in rough-cast ornamental plaster, upon which is worked the date of the foundation and the title of the school. The school contains accommodation for 300 scholars. The walls of the large schoolrooms internally are finished in plain brick with cement dadoes. All the other rooms are plastered and finished with the woodwork in varying shades of a warm reddish-brown, but good for wear and comfortable in appearance. The total cost of the building and fittings amounts to £2,400, or £8 per scholar. The building was designed by Mr. W. S. Wilson, A.R.I.B.A., in conjunction with Mr. J. Wm. Stevens, A.R.I.B.A., of 21, New Bridge-street, E.C., but the former gentleman having to leave England for the Cape on account of ill-health, Mr. Stevens has superintended the work, which has been carried out by Messrs. Lansdown and Co., of Richmond, Surrey.

WOODGREEN.—On Thursday last the capstone of the spire of the church of St. Paul, Woodgreen, which is a landmark in the Wednesbury district, was laid by the architect, Mr. E. F. C. Clarke, of 7, Westminster Chambers, in the presence of the vicar. The work (which we illustrated some time ago) has been carried out in Codsal stone, the contractors being Messrs. Horsman and Co., of Wolverhampton, whose founder, Mr. Philip Horsman, was the original contractor for the church. A peal of bells is being prepared, with clock and chimes, for this tower.

WEDNESBURY.—On Saturday afternoon the memorial-stones of two important additions to St. James's Church—viz, a chapel in memory of the late Colonel J. N. Bagnall, and vestries, were laid. The chapel will be 32½ft. by 22½ft.,

and 20ft. high to the wall-plate; and whilst it will be open to the nave and chancel by arches, it will be fitted with an altar, and arranged in other respects for some of the minor services. The vestries (for clergy, choir, and churchwardens) will surround the apse of the chancel, and these walls will be pierced with traceried windows, and, like the main buildings, be constituted externally of stone, with appropriate dressings. The whole will be heated by means of hot-water apparatus, and the floors be laid with patent wooden blocks. The architects are Messrs. Horton and Son, Wednesbury, and the builders Messrs. Clarke and Son, Birmingham.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

British Archæological Association.—The annual congress of this association takes place this year in Liverpool, extending from the 15th to the 20th August. The opening meeting of the congress will be held at the Town Hall, at 3.30 p.m., when the president and members of the association will be welcomed by the Mayor and Corporation and the local general committee. The president (Sir J. A. Picton, F.S.A.) will then deliver his inaugural address, after which the members of the congress will inspect the Town Hall—proceeding subsequently, under the guidance of the city surveyor, to visit St. George's Hall. The annual dinner will be held at the Adelphi Hotel. Visits have been organised to Wirral, the southern, northern, and eastern suburbs of Liverpool, Runcorn, Warrington, Wigan, the Liverpool docks and river, &c.

Edinburgh Association for Improving the Dwellings of the Poor.—The first general meeting of this Association was held on July 27th, Bailie Russell presiding. The secretary, Mr. David Marshall, referred to the death of the late Rev. Mr. Jolly, with whom the association originated. The Chairman mentioned that they had only about three-quarters of their capital subscribed. The provisional directors were reappointed. After the meeting an adjournment was made to the site of the model tenement in the West Port, where the foundation-stone of the building was laid by Bailie Russell.

Northern Architectural Association.—On Monday, a number of the members of this association, including Mr. G. G. Hoskins, F.R.I.B.A., president, Mr. W. Glover, vice-president, and Mr. Frank W. Rich, hon. sec., visited Castle Howard, near Malton, Yorks, one of the seats of the Earls of Carlisle. The mansion—the design of Sir John Vanbrugh—was commenced in 1702, and, with the exception of the west wing, was completed by him. The entertaining rooms are small; but for the comfort and convenience of the house as a habitation, many improvements have been made since the time of Vanbrugh. The members, after making an inspection of the building, viewing the valuable collection of pictures, and taking photographs of the north and south façades, returned to Malton, and after dining at the Talbot Hotel, commenced their homeward journey by saloon carriage attached to the 5.25 p.m. train for Newcastle.

Royal Archæological Institute.—The inaugural meeting of the Salisbury Congress of the Association was held on Tuesday at the Council House. General Pitt-Rivers, after taking the chair, delivered a long address sketching out the progress of pre-historic research since the society met at Salisbury in 1849. At the close of the meeting the audience proceeded to the Cathedral, which was inspected under the guidance of the Rev. Precentor Venables and Archdeacon Lear. Thence they proceeded to St. Nicholas Hospital, and subsequently visited the palace under the guidance of the bishop, who read a paper at night on the "Sees of the Bishop of Salisbury."

Memorial stones of a new schoolroom and classroom to the Wesleyan chapel were laid at Ham Street, Kent, on Tuesday, July 19. The first stone was laid by Mr. Alexander McArthur, M.P., two others by local friends, and the last one, on behalf of the teachers, by Mrs. Howland, the trowel being presented by the architect, Mr. Henry J. Jeffery, of Ashford (Kent). Messrs. J. Lorden and Son, of Ham Street, are the contractors.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

Received.—W. C. and Son.—C. N. and Co.—J. W. R.—F. M. and Co.—B. of B.—B. and S.—A. P. Co.—C. and Co.—S. Bros. and Co.

"BUILDING NEWS" DESIGNING CLUB.

Drawings Received.—"Truth," "Protoplasmic Globule," "Norseman," "Lost," "Stag," "Blean," "En Avant," "Ierne," "Loidis," "Aspirant," "A Student," "Try Again," "Alley N.," "Vitruvius," "Omega," "Lawton," "Iota," "Northumberland," "Rab."

Correspondence.

ARCHÆOLOGICAL SOCIETIES AND THEIR USELESSNESS.

To the Editor of the Building News.

Sir,—A copy of the Building News of the 1st inst. happened to be sent to me in this out-of-the-way part of the kingdom, and I read with special relish the opinion you so candidly express in the contributors column respecting the inefficiency of archæological societies, "which merely touch the fringe of archæology and degenerate more and more into amiable organisations for the arrangement of pleasant outings." From the experience I have had of these societies in Scotland, I would say that they are an obstruction, and not a furtherance, to research, and are deficient even in the quality of amiability. True, the members flatter each other; but that is a part of the system by which they try to make themselves appear of consequence in the eyes of the public. With the same end in view, they elect a lord as their president, and (to enable them to circulate their own puffs) the proprietor of a newspaper as their secretary. If a marquis or duke sends them an old button or shoe-buckle, they return him a special vote of thanks; but they can be discourteous and insolent enough to untitled outsiders, and I have heard a good many respectable people complain of the rude treatment they received when they ventured to communicate information or hand in old relics. I, myself, have no reason to feel grateful to them.

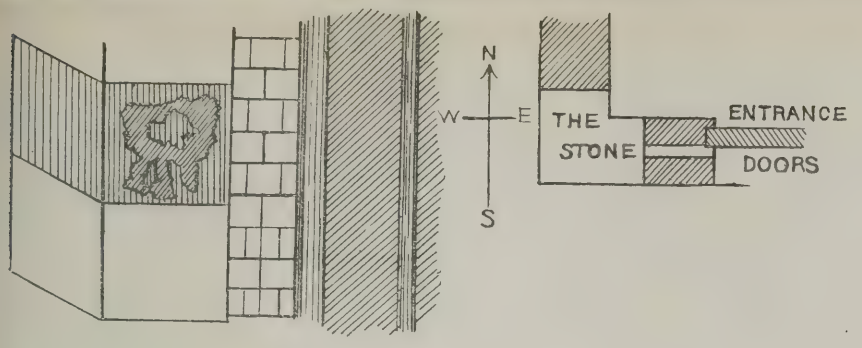
For the last ten years (with occasional intermission) I have been residing in various sequestered islands pertaining to Scotland and studying their archæology. I was the first to search St. Kilda and its satellites for ancient remains. I spent nearly a year in Tiree, and discovered many important relics of the prehistoric ages there. I have been for four years in Shetland, in which ancient remains of the most extraordinary character abound—albeit, unknown to closet antiquaries—the persistent and careful examination of which, aided by light reflected from folk-lore, has enabled me to discover what kind of religion prevailed in these Northern islands in pre-Christian times.

In carrying on these investigations I have received not the slightest encouragement from any antiquarian society; but, on the contrary, have more than once been treated with the grossest insolence. I have accomplished some useful scientific work; but if the smallest assistance had been given me, I could have done much more. I could, for instance, have cleared out two or three of the *brochs*, or so-called Pictish towers, which are in this district, and from the refuse that doubtless still lies under the huge blocks of stone with which the interior is encumbered, have gathered information regarding their ancient occupants.—I am, &c., J. Sands.

Vadlure, Walls, Shetland, July 25.

THE NUISANCE FROM SEWER VENTILATORS.

Sir,—Mr. R. H. Reeves, on p. 193 of to-day's issue, states that in my letter on p. 86, I "completely ignored the most vital part of the question—viz., that it was impossible to get any ventilation through a shaft when the air in that portion of the shaft underground was of a colder and heavier gravity to that of the inlet or outlet." Now, I beg to state that I did not ignore this statement, but repudiated it, and now I deny it. On p. 86 I used the word "curious." To-day I beg to state that I consider the above premise purely fanciful or untrue. If the premise be fanciful, the deductions fall to the ground.



As to Mr. Reeves's numbered replies to me, I take them in their order:—

1. On p. 52, ninth line of his letter, he does mention "an offensive grating." He wrote a similar letter, in which, as published, the words "brick ventilating pipe" occur, where "6in. ventilating pipe" appears on p. 52. That misprint or mistake was not mine.

2. If a street sewer-grating has a ventilating pipe for sewer below it carried away and led up a wall, said "grating," if used to carry off water, should have a water-trap below it. If in centre of street, and not so used, an "iron grating" under the circumstances mentioned is absurd. It should have been a strong iron close plate set into a strong iron frame. I had this in my mind when I wrote as I did on p. 52. In many cases there are iron gratings on street at the edge of the pavement which ventilate the sewer in an offensive and, in my opinion, even criminal manner, owing to want of a water-trap below them.

3. Mr. Reeves's remarks in these paragraphs on p. 193 are misleading if not watched. In paragraph 4 he says of the ventilating shaft that it did not fail to ventilate the sewer "through faulty construction." I affirm that it was absurd to imagine that the ventilating shaft put up as per Fig. 1 on p. 193, and with its top or outlet "half-way up a chimney," and with a bonnet on it as depicted, could effectually ventilate the sewer or anything else. Further, supposing Mr. Reeves said the ventilating pipe was clear, I was not necessarily bound to believe him, more especially as he did not explain how he tested its clearness. If by the smoke test, it might be three-fourths or more choked at foot of bend while he supposed it was clear. I have come across lots of cases of this sort. I referred to painting the inside of the iron pipe to prevent it from rusting, and so not spoiling the ventilation by falling rust. Mr. Reeves's reference to "friction" is, therefore, uncalled for, or not to the point.

5. Mr. Reeves challenges me to prove that "stack-pipes" are useful, or will give a motive power for sewer ventilation. To this I reply, that if the stack-pipe is properly put in, and its bottom pipe led with a fall of only a half-inch or more *towards the sewer*, while the top of

pipe is set up higher than the chimney, or where the wind can get freely at one of my fixed ventilators placed on its outlet—then a current of air will go through the shaft, notwithstanding Mr. Reeves's "heavy air" scarecrow in the underground ventilating pipe.

As the Tottenham air pipe, as described by Mr. Reeves, is not properly put up, it is waste of time to talk of the effect from the temperature at its top being 106°, while temperature at street grating is 110°, and air in underground pipe 63°. And the first two high temperatures of the outer air do not occur every day. Mr. Reeves, in my opinion, is not dealing with the question in a practical manner; but in a fanciful theoretical style, as he also does when, on page 193, he further says that the difference of (barometric) atmospheric pressure at inlets and outlets will give as certain a force as that of a steam boiler. I do not think Mr. Reeves treats this subject properly and to the point on page 193, whatever he may do anon.

As to what Mr. Reeves says about a ventilator capable of producing a current at the rate of fifteen miles an hour (*i.e.*, 1,320ft. a minute) being useless for ventilating a sewer, I do not see it. If the ventilator were a wind-acting one, and only caused a third or less of the speed above stated, it would do very well.

Supposing A, Fig. 1, on page 193, were the inlet grating above one of my disconnecting traps, C the underground drain of house behind it, and B the top of its ventilating blow-off pipe set up above a chimney or ridge with one of my ventilators on it; now although the drain C were, say, 160ft. long and the vertical pipe 40ft., then, as I have often tested it, smoke applied at A would be sucked in by the current, carried along C, and be out at B in about two minutes or less.

That is *practical* ventilation; if it does not agree with Mr. Reeves' "barometrical pressures," so much the worse for his barometer, whether material or mental.—I am, &c.,

W. P. Buchan.

NEW POST OFFICE, KNUTSFORD.

Sir,—Mr. Halsey Ricardo does not appear to be too familiarly acquainted with the old examples in this style of work; therefore for his especial information I may tell him that the upper portion of façade for above was suggested by an old house at Ipswich, now, I believe, used for the Ipswich Public Library, and erected about 1567. Probably this was also the source which suggested to Mr. Norman Shaw his design for the New Zealand Chambers, which would account for the slight similarity our correspondent has been kind enough to point out. I should think, however, Mr. Halsey Ricardo will allow me the same privilege of adapting an old example to modern requirements as others.

At the same time, I am an ardent admirer of the designs of Mr. Norman Shaw, and I should be by no means ashamed of taking any hint in design that may be conveyed to me by a study of his masterly works.

Mr. Halsey Ricardo's remarks are unnecessarily supplemented with an opinion as uncalled for as it is valueless.—I am, &c.,

Wm. Owen.

134, Deansgate, Manchester.

STONE THE WRONG WAY OF ITS NATURAL BED.

Sir,—I have read with much pleasure the letter by Mr. H. T. Percival on the above subject in your issue of the 22nd inst., and as the subject is one of considerable interest to all members of our profession, you may perhaps allow me to bring before them a very similar case which lately came under my notice in this town.

In the Church of Saint Jude, Southsea, there is at the present moment a block of stone set the wrong way of its natural bed, the outer surface of one side of which is "peeling off like a skin," exactly in the same manner as that referred to by Mr. Percival. The stone is situated at the corner of the south porch, and at a height of some 9ft. from the ground.

It is somewhat strange that although two sides of the stone are exposed, only the south and least exposed side is affected, the side facing the west, far more exposed to weather than the other, being absolutely sound.—I am, &c.,

T. Gilbert Stevenson, LL.D., Architect.
24, South Gardens, Southsea, July 29.

WATER SUPPLY AND SANITARY MATTERS.

Leamington.—Major-General C. Phipps Carey, one of the Local Government Board Inspectors, held an inquiry at the Town Hall, Leamington, on the 28th July, respecting the application of the town council for leave to borrow three sums of £1,033, £1,230, and £500. Mr. Passman explained that the £1,033 was for works in connection with the watering of the streets. The water for this purpose had been taken from the supply of the artesian well; but, as it was considered that river-water would do just as well, pipes were now being laid to certain parts of the town, so that the river-water could be so used. The loan of £1,230 was required for electric-lighting purposes at the Town Hall and Free Library, the pump rooms, and lighting up the parade for about a quarter of a mile. The loan of £500 was required for the improvements at the pump rooms.

Sewage in the Lea.—A public inquiry was held at the Stratford Town Hall yesterday, before Mr. S. J. Smith, Local Government Board Inspector, into the condition of the River Lea and Bow Creek. Evidence was given by Mr. C. W. Raymond, inspector for the Poplar Local Board, showing that the Lea was full of sewage, which being pumped into the river on the flood tide, was carried upwards instead of out towards the sea. Mr. Angell, borough engineer, in cross-examination, admitted that the West Ham Corporation had not sufficient tanks to contain all the sewage for a tide, but that they intended to construct more for that purpose. On behalf of the Conservancy, it was stated that they did not think it desirable to press unduly upon the West Ham Corporation, as they were doing the best they could to deal with the large amount of sewage. The legal gentlemen on both sides agreed that, in order to see what steps the West Ham Corporation would take, the best course was to have the inquiry adjourned. Mr. Layard stated that he was preparing a Bill for the acquirement of more land for the erection of sewage works. The inquiry was then adjourned till the 27th of October.

The York City Council have adopted the report of the special committee recommending the carrying out of the Free Libraries Act for York, and to purchase for £7,000, of which amount £5,000 has been raised by subscription, the York Institute and the Fine Art Institution.

The annual conference of the Institution of Mechanical Engineers commenced on Tuesday, in the University of Edinburgh. The proceedings were opened by the reception of the president, Mr. E. H. Carbutt, and the council and members of the institution, in the Library Hall, by the local committee, the Lord Provost and magistrates, and University authorities. Several papers were read and discussed, and in the afternoon there was an excursion to the Forth Bridge Works.

Intercommunication.

QUESTIONS.

[9358.]—**Bottom Flange.**—Will some reader kindly inform me how to calculate the strength of T and double-

flanged rolled iron joists loaded on bottom flange, thus?—A.

[9359.]—**Rustless Iron.**—Can any of your numerous patrons give me information respecting the Bower-Barff process for preventing iron and steel from rusting? If they can give such practical information as to cost, durability, and where and how to get it done, the writer will be much obliged.—A Constant Reader.

[9360.]—**Fixing Photos.**—I beg to thank the readers who so kindly answered to my query under this heading, and request "Bookworm," who answered in the issue of the 22nd July, kindly to give me some further particulars on the gelatine he uses in the third process he has suggested. Any information will be most thankfully received.—G. H. G.

[9361.]—**Sanitary Stabling.**—I notice in the Building News for July 29th that in both the designs placed first and second in competition for "A Village Public-house," the dung-pit is shown against the outside wall of stabling, and the hay-shoot is fixed abutting on to the inside face of same. Both plans have windows over the pits, and in one case a fresh-air (?) inlet is marked. Is not this (a too-common arrangement) radically wrong, as the liquid from the manure is liable to sodden the out wall of stable and surrounding ground, thereby proving an insidious enemy to health and also an injury to hay-shoot and contents? Besides air admitted by windows over pits will be unsavoury and bad for breathing purposes. Should not all pits be placed at a satisfactory distance from any building, and rendered liquid proof?—Tolop.

[9362.]—**Surveyors' Exam.**—Will some reader inform me what books are needed for working up exam. Surveyors' Institute, and the most popular authors of such books?—Tertius.

REPLIES.

[9333.]—**Ventilation and Prevention of Down-draught in Churches.**—It was my intention, when perusing "Rex's" original question, to send to the Intercommunication Column a reply stating my theory; but press of other matters caused me to forget until I saw yesterday Mr. W. P. Buchan's remonstrance in the issue of the 29th ult. I have been so fortunate as to be called in to advise in an exactly similar case. I found on inspection that the outlets in the inner ceiling had been closed and covered with hay, and that the outer ventilator of the roof would only permit egress; yet in spite of all, the down-draught was felt. I also found that all the air grids under the floor had been stopped up, and that inside the building heavy curtains had been hung before all doorways. As in the case related by "Rex," there was no possibility of a draught occurring, except that the presence of the draught showed the possibility. My reputation for architectural competency was at stake. I was almost at a loss what to think until it came out in conversation that the alleged draught was only perceptible on the Sunday morning, disappearing entirely by the time of evening service. I notice "Rex" also says that the draught disappears after the chandeliers have been lit for a time, which is to my mind a further proof that my theory is correct. I say in my report, which was also sent in last month, that the air above and the ascending warm air is cooled so quickly by the roof windows, &c., as to fall to the floor very rapidly, so rapidly as to feel like a draught. The cure is to get the roof, &c., warmed before service time, and I advised that the heating apparatus, which is generally lighted on a Saturday afternoon, be got to work about 12 hours' earlier. It is not too small, as is shown by the fact that the chapel does get warm, although not soon enough for all requirements. I may say that I warned them against keeping the outlet ventilators closed on account of the re-breathing of the foul air which in its turn will be cooled and descend, though I gave permission for them to be closed during the operation of heating; but to be opened whenever the congregation was above a certain number. I believe my theory to be the correct and only logical one, and should be glad, with the Editor's permission, to read the opinion of other correspondents upon it.—H. Gilbert.

[9352.]—**Rainproof Colour Wash.**—In reply to "L.," the address is "A. T. Morse and Co., Perry-road, St. Michael's, Bristol." If "L." will write to me direct and fully, I shall be glad to help him.—William A. Goss Torquay.

At the last meeting of the Cardiff Health Committee it was reported that Cardiff was a catchpit for the sewage of the whole of the Rhondda Valley, the numerous towns in which drained into the River Taff, which terminates at Cardiff. It was also asserted that the town refuse of Pontypridd and the sweepings of tanneries and slaughter-houses were discharged into the river, and that all the decomposed matter was carried down to and deposited at Cardiff. A committee has been appointed to investigate the matter.

A great academical art exhibition was formally opened at Berlin on Monday. The exhibition, which is for the works of living German and foreign artists, contains 970 oil-paintings, 39 pen-and-ink sketches, 132 water-colours, and 147 works of sculpture.

PARLIAMENTARY NOTES.

VENTILATION OF THE HOUSE.—Mr. Esslemont asked the First Commissioner of Works on Monday whether he had any reason to believe that the noxious air in the House was due to the artificial system of ventilation; and whether, by way of experiment, he would allow the present system to be discontinued for a few days, in order to allow fresh air to be admitted from the windows in the roof. Mr. Plunket: I have no reason to believe that the air in this House is noxious, and what the hon. member calls the artificial system of ventilation consists simply in this—that the air which members have been breathing is drawn out through the ceiling, so that fresh air may constantly enter the more freely from below. In hot weather this air is passed over ice to make it cooler. I cannot advise that the experiment suggested by the hon. member of discontinuing this system should be tried. Dr. Kenny asked whether the suggestion made by the hon. member for Mid Cork as to straining the air introduced into the House had been taken into consideration. Mr. Plunket said that such experiments had been tried.

THE BURLINGTON-HOUSE COLONNADES.—The Earl of Milltown asked on Monday whether the Commissioner of Works would take steps to have the colonnades of Burlington House, now lying derelict on the banks of the river in Battersea Park, protected from injury, either by a fence or some other adequate provision. These colonnades were beautiful works of art, and he had been surprised to find the representative of the Office of Works in that House inclined to pooh-pooh suggestions with regard to them. The Earl of Wemyss thought it was a great scandal that these colonnades should be allowed to go to ruin. He feared that they were already too much injured to be utilised. Earl Brownlow said he would not enter into the architectural merits of the colonnades, but he must deny that he had ever pooh-poohed their artistic value. He had on a former occasion stated that a great many schemes had been laid before the First Commissioner of Works with regard to them, which had all been pronounced impracticable not merely on the ground of expense. The noble earl had himself been invited to make any suggestion for their utilisation, but he had so far made none. With regard to the proposal that they should be fenced round, it was necessary to explain that a Bill was now before Parliament handing over Battersea Park to the Metropolitan Board of Works. Under these circumstances the First Commissioner of Works could give no pledge except that he would give the proposal of the noble earl his most careful consideration.

THE NATIONAL GALLERY.—Mr. Graham asked the First Commissioner of Works whether it was contemplated to replace the existing mean stone steps that lead to the new rooms of the National Gallery by steps of unpolished marble more suitable to the surroundings. Mr. Plunket: The question of the material to be used in the steps of the new staircase of the National Gallery received my full consideration, and, having regard to the constant heavy wear upon these steps, especially at holiday times and in bad weather, it was decided that in the circumstances Craig-Leith stone, which has been used, was a more suitable material for the position than marble. There is no intention of making any change in these steps.

LEGAL INTELLIGENCE.

FALL OF A ROOF AT WOOLWICH—CONDEMNATION OF GOVERNMENT BUILDINGS.—An inquest was held at the Town Hall, Woolwich, on Monday week, on the body of John Vinden, asphalte roofer, of 105, Tyre-street, Vauxhall, who was killed by the fall of a roof at the Grand Depot Barracks, Woolwich, the previous Friday. Henry George West, superintendent of works, Claridge's Asphalte Works, 21, Surrey-street, London, said deceased had been in the employ of the firm 42 years. He had been foreman 25 years, and had worked in all parts of England. They were working by contract with the War Department when the accident occurred. They had to carry out the instructions of Captain Booth, R.E. Department, with a view of preventing the water percolating through. They heard of the accident at six o'clock, and he came down to Woolwich. He thought it possible that the accident occurred from the bad concrete put in nine or ten years ago. The roof which fell was composed of coke breeze and cement. He had known a roof 12ft. square similarly constructed; but recommended an iron girder for absolute safety. Captain C. Wilkinson, R.E., residing in the Artillery Barracks, Woolwich, said the work was carried on under the supervision of Captain Booth. He had traced the erection of the harness rooms. They were put up from designs approved by the War Office in 1878. The roofs had from time to time been tarred over with gas tar to fill up the cracks. He attributed the accident to the concrete being badly mixed and not properly laid. The proportions of the concrete were four of coke breeze to one of Roman cement. It had to be very carefully mixed. A number of other buildings in the barracks, similarly constructed, were showing signs of weakness, and the roofs would be removed. Captain Booth, Acting Engineer at Woolwich under the War Office, said the work was in his district, and under his supervision. When he joined at Woolwich 18 months ago, he found all the harness rooms leaky, and spoiling the harness. They were all cracked transversely, and temporary remedies were applied to stop the leaking. Six weeks ago he received orders to have the roofs coated with Claridge's asphalte, and this was being done when the roof collapsed. He had conferred with deceased about the work, telling him to make a good job of it. He assured him that when finished, the roofs would be all right. The concrete was of very bad material, and very badly mixed—the worst he ever saw. The breeze was half-burnt cinder mixed with coal. He also condemed the design *in toto*. He entirely disapproved of concrete roofs. They were peculiar to Woolwich. He had never seen any at other places. When it was built, it was tested by 17 men being placed on the roof at "the double." He never knew asphalte or concrete stand an unusual heat. He had condemned all the other harness rooms. They had all been shored up. He would not sleep under a concrete roof (laughter), especially in hot weather. The jury returned a verdict of "Accidental Death," the coroner remarking that the roofs of the harness rooms were novel and unsafe. He wondered they had stood so long. It was fortunate there were no soldiers inside looking after the harness when the roof collapsed. The jury unreservedly concurred in the design and workmanship being bad, and the concrete faulty. The jury's condemnation was ordered to be sent to the military authorities.

RE J. N. PEAKE.—A meeting of the creditors of John Nash Peake, Belle Vue, Congleton, Cheshire, and trading at Knutton and Cobridge, Staffordshire, as colliery proprietor and brick and tile manufacturer, was held on Monday at the North Stafford Hotel, Stoke-on-Trent. The debtor's statement showed gross liabilities, amounting to £60,100 4s. 1d., of which £28,009 3s. 7d. are expected to rank for dividend. The assets (including the stock-in-trade £1,600, and machinery, &c., £8,700), were estimated at £12,500 0s. 7d., which, after deducting preferential claims to the extent of £3,702 8s. 1d., left a deficiency of £19,211 11s. 1d. The debtor assigned as the cause of failure bad trade and trade losses. In his observations upon the debtor's statement, the Official Receiver said that Mr. Peake had been carrying on business as a colliery proprietor and brick and tile manufacturer at Knutton and Cobridge. He first commenced business about fifteen years ago with a capital of £15,000. Since that time he had been a partner in the Tunstall Chemical Works Company, the Pontyscylte Ironworks Company, and the Pack Moor Colliery Company. The debtor stated that in all these concerns (which have been dissolved) he had sustained heavy losses. The fully-secured creditors were (1) the Scottish Wagon Company, whose debt was stated at £673 19s. 5d., the security held being wagons, the value of which is stated at £1,800; (2) Messrs. Elliot and Clyve, who are creditors for £800, money advanced, the security held being a first mortgage of colliery and cottages at Goldenhill, estimated at £1,000; (3) the trustees of Mr. T. Llewellyn, whose debt is stated at £80, money lent, the security being a first mortgage of house in Watergate street, Tunstall, estimated at £80. The creditors partly secured were (1) the trustees to Mr. T. Llewellyn for £5,500, for money lent in 1876, the securities held being a first mortgage of cottages and land at Knutton and life policies, the securities being estimated at £5,000; (2) the Manchester and Liverpool District Bank for £27,000, the amount of the debtor's banking account, the securities held being a first mortgage of the Cobridge Colliery, mortgage of share under his father's will, guarantee, life policies, and bills, the estimated value of the securities being stated at £9,400; (3) Mrs. J. N. Peake, for £2,000, money lent in 1883, the security held being "contingent share under Mr. Barber's will," estimated at £1,990; (4) the trustees of Mr. T. Llewellyn for £1,250 for money lent, the security held being "Pack Moor Colliery," estimated at £600; (5) Mrs. Peake and sisters, £3,750 for money lent, the securities held being life policies, estimated at £250; (6) trustees of the will of Thomas Peake, deceased, £9,680 14s. 11d., money advanced at various times between 1882 and 1886, the security held being "share under father's will," estimated at £9,000. A considerable portion of the furniture and part of the plate at Belle Vue House are claimed by Mrs. Peake. Distresses for rent had been levied by the Rev. Walter Sneyd for £387 14s. 2d., by the governors of the Newcastle-under-Lyme Endowed Schools for £3,015 13s. 2d., and by the trustees of the Sandbach Charity for £187 10s. He (the Official Receiver) had arranged with the solicitors acting in the two first cases that the distresses shall not be proceeded with until after the first meeting. The debtor accounts for his deficiency of £19,211 11s. 1d. by "losses in trade." The Chairman briefly explained the debtor's statement, after which Mr. Peake was called in to the meeting, but no questions were put to him. There was no offer on behalf of the debtor, and a formal resolution was passed authorising the Official Receiver to apply to the Court to adjudicate the debtor a bankrupt. Mr. T. W. Handley (of the firm of Handley and Wilde), chartered accountant, Booth-street, Manchester, was appointed trustee with Messrs. E. J. Hooley, bank manager, Tunstall, R. B. Millard, ironmonger, &c., Newcastle-under-Lyme, and P. H. Pope, accountant, Tunstall, as a committee of inspection.

PATENT CASE.—HUMPHERSON V. SYER.—(Before Lords Justices Cotton, Bowen, and Fry, Appeal Court, July 28).—This was an appeal by the defendant from a judgment of Mr. Justice Kekewich affirming the validity of the patent granted to plaintiff on the 24th of February, 1885, for an improved waste-water preventer, and finding that the defendant had infringed. The validity of the plaintiff's patent was attacked on the ground of alleged anticipation by Winn's patent of 1881, and also by prior publication by the provisional specification of a patent granted to the defendant Syer on the 14th of January, 1885, which was alleged to have been an improvement upon Winn's invention. On the question of anticipation by alleged prior publication, it appeared that the defendant had employed a Mr. Widmer early in January, 1885, to make him a waste-water preventer according to his instructions, so as "not to fall foul of Winn's patent," with which he was acquainted. It appeared that a model was made before the end of January, and remained at Widmer's workshop, capable of being seen by the workmen, though not exposed for sale, and, after a time, put upon the shelf. It was not in contest that the machine made by the defendant was similar to that for which the plaintiff had obtained a patent, and the only question in the action was the validity of the plaintiff's patent having regard to alleged anticipation of the invention. The appeal was allowed. Lords Justices Cotton and Bowen were both of opinion, without deciding whether Winn's patent of 1881 was or was not alone an anticipation of plaintiff's or defendant's patent, that there had been prior publication of the invention in this country before the plaintiff obtained his patent. Lord Justice Fry came to the same conclusion, though by a different way. The question was whether certain persons under no obligations to secrecy had got to know of the invention before the plaintiff had obtained his patent. Upon the evidence he had come to this conclusion, and he therefore concurred in holding that the plaintiff's patent was bad, and that the judgment of Mr. Justice Kekewich must be reversed.

STATUES, MEMORIALS, &c.

THE LATE CHARLES READE.—Sir Algernon Borthwick, M.P., on Tuesday unveiled a memorial to the late Charles Reade, which has been placed in the crypt of St. Paul's Cathedral by private subscription. The memorial, which is the work of Mr. G. M. Curtice, consists of a medallion portrait taken from a cast of the features after death, beneath being the inscription. In close proximity to the memorial is the bust of George Cruikshank, and one to the memory of Randolph Caldecott will shortly be erected near.

CHIPS.

Mr. J. Graham Abercrombie, architect, of 97, High-street, Paisley, writes:—"The notice in last week's BUILDING NEWS of 'Greenlaw Church, Paisley,' in which my name appears, should read *late* chief draughtsman with Messrs. Jno. Burnet and Son, Glasgow, and not as inserted, chief draughtsman at present."

A large new Welsh chapel is about to be built in Falmouth-road, New Kent-road, by the congregation of Crosby-row Chapel. The appointment of architect was settled on Tuesday last. The voting was unanimous in favour of Mr. Charles Evans, F.R.I.B.A., of 3A, Poets-corner, Westminster, who was accordingly appointed architect.

A meeting was held on Tuesday of the committee for the preservation of the Queen Eleanor Memorial Cross, at Waltham Cross, erected in 1291. A letter and report from the Society of Antiquaries was read, in which they approve the work now being done, and also of the proposals of the architect, Mr. C. E. Ponting, of Marlborough, Wilts. The Society add that the proposed repair seems to deserve support. The Council of the Society of Antiquaries had subscribed £5 to the fund. Although £650 has been promised, it appears that to carry out the repairs at present contracted for about £250 more is required, and a further £200 will be needed to produce new steps, bench, and a wrought-iron railing for the protection of the Cross.

Our Office Table.

THE annual general meeting of Turpin's arquet Floor Joinery and Wood-Carving ompany (Limited) was held at 22, Queen's-oad, Bayswater, on the 30th June, the man-ging director, Mr. M. F. C. Turpin, in the chair. he report and balance-sheet were unanimously dopted, and it was resolved that a dividend of 0 per cent. per annum be declared upon all hare capital from the date subscribed. The ompany has just been intrusted with an nportant contract for laying a large quantity f their solid oak flooring on concrete for the ew Great Northern Central Hospital, now eing erected in the Holloway-road. This ontract was secured by the company in open ompetition.

AT the meeting of the Metropolitan Board of Vorks last Friday a letter from Mr. Robertson as read, in which he stated that during the wenty-one years he had been in their service nly one property belonging to the Board had een disposed of through a relative of his. He enied that he had ever abused the confidence f the Board for his own pecuniary benefit. he letter was referred to the Works Com-ittee.

THE architecture of Jerusalem—Oriental, othic, Byzantine, or Italian—is a sermon in tones on the text that the Holy City has been or so many centuries the religious centre of ivers faiths and numerically of half the world. utside the walls a new town has sprung up, building club having been established a few ears ago, under the operation of which 130 ouses were erected in four years by the Jews; hilst along the Jaffa road many country villas ave been erected of late by European resi-ents as summer abodes. The latest develop-ent of the building of new houses without erusalem is to be found in the enterprise hich has led to much building being done on ne slopes of the Mount of Olives, the summit f which is crowned with the Church of the scension.

THE treatment of iron so that it is not ffected in any degree by rust, and so that it oes not require the frequent use of paint and arnishes to make it rustless, seems at the resent time to be attracting the attention of rchitects, engineers, and others who are terested in this matter. The Bower-Barff ustless Iron Company, of Broadway Chambers, estminster, whose process is well known to ur readers, are at present very busy with ork, and we would call the attention of anufacturing engineers to it. Several archi-cts have all their rain-water pipes treated by is process; also water-pipes where the water hard. Engineers are also having a great eal of outside ironwork treated.

WE are glad to see that Mr. H. H. Bridgman as been presented with a tea and coffee rvice in silver, subscribed for by the members f the Gas and Water Committee of the Cor-oration "in recognition of his able and alous services as chairman of the committee uring the year 1886." The presentation was ade at the Crystal Palace, when about 100 dies and gentlemen dined together, under the residency of the present chairman, Mr. W. A. lunkett. Special reference was made on the casion by Mr. Bridgman to the importance of e clauses introduced at the instance of the orporation into the recent Metropolitan ater Bills by the Special Committee of the ouse of Commons. The most important were ose rendering it imperative that all future w stock should be submitted to public com-tition, and that a reserve fund be created of l profits over and beyond 5 per cent. (for terest and working expenses), for the pur-se ultimately of purchasing the interests of e several water companies. As an instance the value of these clauses, on every £100,000 new stock that would yield 10 per cent. terest £5,000 annually would go to the serve fund, which, capitalised at 25 years' rchase, or 4 per cent., would mean £125,000 ved to the ratepayers; but for the action of e Corporation these enormous sums would go to the pockets of existing shareholders, and uld ultimately have to be purchased by the tepayers.

IT has been proposed that the Tercentenary Exhibition of Mary Queen of Scots Relics, now being held in the Peterborough Museum, under the patronage of Her Majesty the Queen, and the presidency of the Dean of Peterborough, should be further observed by some permanent memorial in connection with the restoration of Peterborough Cathedral, to be erected in memory of Mary Queen of Scots, whose first grave was in that building. The nature of the memorial will be determined by the amount of the subscriptions, which will be limited from one to ten shillings; and it is suggested that everyone who bears the name of Mary (Marie, Maria, &c.), should give a donation for this purpose. Subscriptions will be received by Mrs. Perowne, The Deanery, Peterborough, and Mrs. Gates, The Vineyard, Peterborough, from whom collecting cards may be obtained.

A CURIOUS circumstance has arisen at the audit of the accounts of the Sherborne Local Board. Considerable ill-feeling has prevailed respecting a loan, secured for the extension of the waterworks, having been partially used by the old board for works connected with the sewers. The members of the old board resigned, and at the audit last week it was discovered that the seal of the board had not been affixed to the contract. The auditor consequently refused to pass the accounts, and said he should surcharge the old board with the amount—about £2,000. At a meeting of the new board last Friday an application by the clerk for the seal to be affixed was unanimously refused.

THE Sukkur Bridge—a remarkable feat of engineering—has just been completed at the works of Messrs. Westwood, Baillie, and Co., London-yard, Poplar. The bridge, which is on the cantilever principle, is to be constructed over the Kohri Pass of the Indus at Sukkur, on the line of railway from Kurrachee and Attock. A noticeable feature about the work is the erection of probably one of the finest pieces of scaffolding which has ever been built, and which has been a conspicuous object on the banks of the Thames at Poplar and for miles around. It is 400ft. long by 120ft. wide, and 180ft. high, with about 2,600 loads of timber, which, if laid out, would measure 24 lineal miles, the weight of the bolts, nails, and other ironworks being about 40 tons. The contract has taken about two years to complete, the bridge having to be temporarily erected at the works previous to being sent out to India.

IN 1830 but 381 kilomètres (236 miles) of railway were open for traffic; at the present time, according to Dr. Neumann-Spallart (*Uebersichten der Weltwirthschaft*, 1887), the mileage of the railways of the globe exceeds 530,000 kilomèters (329,000 miles). A review of the development of railways during 1881 to 1885 shows that in Europe the growth was from 107,333 miles in 1881 to 121,205 miles in 1885, or 12·9 per cent.; in America, from 118,662 miles to 155,757 miles, or 31·3 per cent.; in Asia, from 10,621 miles to 13,791 miles, or 29·7 per cent.; in Africa, from 2,871 miles to 4,285 miles, or 49·2 per cent.; in Australia, from 5,257 miles to 8,045 miles, or 53·1 per cent According to this statement the railways had increased from the end of 1881 to the end of 1885 by a total of 58,339 miles, and, consequently, at the latter date the total length was 303,083 miles. America shows the greatest increase, and possesses more railways than the rest of the world combined; but the percentage of increase was greatest in Australia.

ACCORDING to a table published by the *Archiv für Eisenbahnwesen* last year, the average cost of construction per mile in Europe was about £24,000, and in all other countries £12,700. The railways of Europe, consequently, at the end of 1885, had a total value of £2,909,000,000, and those of all other countries of £2,295,000,000, making a grand total of £5,114,000,000. Of European countries, Germany possesses the most extensive railway system. The other countries come in the following order:—France, England, Russia, Austria, Italy, Spain, Sweden, Belgium, Holland, Switzerland, Denmark, Roumania, Norway, Portugal, Turkey in Europe, Greece, Servia. Relative to the area, Belgium has the densest network of railways in Europe, and in the world. The other States follow in this order:—England, Holland, Germany, Switzerland, France, Denmark, Italy, Austria, Spain, Portugal, Sweden, Roumania, Norway, Greece, Russia, Servia, Turkey. Of the German States, the kingdom of Saxony has the closest network of railways, being second in this respect in the world. Relative to population, Sweden has the greatest mileage of railways in Europe, the other European countries ranking as follows:—Switzerland, Denmark, France, England, Norway, Germany, Belgium, Holland, Austria, Spain, Italy, Portugal, Roumania, Russia, Greece, Servia, Turkey.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Clerk of Works' Association, Carpenters' Hall. Paper by Mr. Sims Dillon on "Technical Education and its Bearing on Clerks of Works." 8 p.m.

ARCHITECTURAL ASSOCIATION,

9, CONDUIT STREET, W.

The SIXTH VACATION VISIT will be made on the Afternoon of SATURDAY, August 13th, to the Seat of Bertram W. Currie, Esq., near Farnboro', Hants. The late George Devey, Esq., and James Williams, Esq., Architects. All members who intend to go must send in their names to W. J. H. Leverton, 15, Whitehall-place, *as soon as possible*, together with Postal Order for 2s. 9d., for special railway fare, and a stamped directed envelope.

THOS. EDWARD PRYCE } Hon Secs.
FREDERIC R. FARROW }

CHIPS.

Messrs. North and Son, London-road, Southwark, having back a large iron building lent on hire to the National Agricultural Hall Company, Kensington, have erected the same on 10 acres of freehold land fronting the Epsom-road, Morden, S.W., and last Saturday week inaugurated it by placing it at the disposal of the workmen and wives of Messrs. Field and Sons, estate agents, Borough, for their annual outing, to the number of about sixty. Next Thursday Messrs. North and Son hope to have about 150 blind persons, representing all branches of the building trades there, and they will be glad of any contributions towards entertaining them.

Preparations are being made at the Royal Holloway College, Egham, for the erection of a memorial of the Queen, who opened the Institution. The statue of the Queen is of white marble, and 9ft. high. It was sculptured by Count Gleichen.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Shop Fitter, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Holloway's Pills.—These famous Pills purify the blood, and act most soothingly on the liver, stomach, bowels and kidneys—the great mainsprings of life. They are wonderfully efficacious in all ailments incidental to females. To the emigrant, traveller, soldier, and sailor, they will be found invaluable in the time of need.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

BEST BATH STONE.

FARLEIGH DOWN, CORSHAM DOWN, BOX GROUND, COMBE DOWN, WESTWOOD GROUND. STOKE GROUND.

RANDELL, SAUNDERS, & CO., LD.,
CORSHAM, WILTS.

BATH STONE.

PICTOR'S MONKS' PARK. CORSHAM DOWN. BOX GROUND. FARLEIGH DOWN. COMBE DOWN. STOKE GROUND. WINSLEY GROUND. WESTWOOD

PICTOR and SONS, BOX, WILTS.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

COX, SONS, BUCKLEY, & CO.,
ART WORKERS IN
STAINED GLASS,
Decorative Paintings, and Metal Work.
Southampton-street, Strand, London.

C. B. N. SNEWIN,
MAHOGANY, WAINSCOT, WALNUT, & TEAK MERCHANT,
Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, Back Hill, Hatton Garden; and 29, Ray-street, Farringdon-road, E.C.
The largest stock of thoroughly seasoned hardwoods, in all thicknesses, ready for immediate use. Telegraphic Address: "SNEWIN, London."

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ABERDARE.—For the erection of a Wesleyan chapel at Trecynon, Aberdare, S. Wales. Mr. W. Drew, 22, Victoria-street, Swindon, Wilts, architect:—

Davies, D., Aberdare (accepted) ...	£550 0 0

ASHTON-ON-MERSEY.—For a reading-room at Ashton-on-Mersey, for Sir W. Brooks, Bart., M.P. Mr. G. Truefitt, 5, Bloomsbury-square, W.C., architect:—

Haywood, B.	£1782 2 10
Southern and Sons	1,460 0 0
Cross and Bell	1,395 0 0
Wilson, Toft, and Huntley* ...	1386 0 0

* Accepted.

BERMONDSEY.—For the ventilation of the Board room at the Bermondsey Workhouse, for the guardians of St. Olave's Union. Messrs Newman and Newman, 19a, Tooley-street, London Bridge, architects:—

The Eolus Waterspray Ventilation Co. (No competition).	£59 18 0

BROMPTON.—For shop-front, 215, Brompton-road, S.W., for Mr. Murphy, New-street. Mr. G. Pooley, 26, Charing Cross, architect:—

Chafin	£150 0 0
Drew and Cadman	148 0 0
Sage and Co.	147 0 0
Heath, 11, Hans-road, Brompton-road (accepted)	132 0 0

BRISTOL.—For taking down kilns, stacks, buildings, and clearing the site of new day industrial school, for the Bristol School Board, under the supervision of Messrs. J. W. Trew and Sons, 22, Broad-street, Bristol, architects:—

	Credit.	Debit.
Reynolds	— ...	£200 0 0
Turner	— ...	147 0 0
Ridewood ...	— ...	120 0 0
Balmont	£55 0 0 ...	—
Holbrook	87 0 0* ...	—

* Accepted. All of Bristol.

BROMLEY.—For new road, Queen's Mead, Bromley, Kent, for the Bromley Local Board. Mr. H. S. Cregeen, surveyor:—

Marshall, J. G. B.	£999 0 0
Mowlem, J., and Co.	785 0 0
Lansbury, T.	780 10 0
Woodhams and Fry	769 0 0
Cattley, A. T.	744 0 0
Peill, E., and Sons (accepted) ...	744 0 0

BRISTOL.—For Easton-road board schools, Bristol. Messrs. Hansom and Bond, Clifton, Bristol, architects. Quantities supplied:—

Cowlin and Son	£5,170 0 0
Church, W.	4,985 0 0
Eastabrook and Sons...	4,959 0 0
Humphreys, G.	4,943 0 0
Forse, H. A.	4,930 0 0
Stephens and Bastow	4,679 0 0
Howell and Son	4,650 0 0
Turner, S.	4,570 0 0
Davis, J. E.	4,557 0 0
Wilkins, J., and Son...	4,550 0 0
Beaven, A. J.	4,390 0 0
Perrott, J.	4,324 0 0
Lewis, J. R. (accepted)	4,290 0 0

CARLISLE.—For house and shops, Hart-street and Broad-street, for Mr. S. Neilson. Mr. H. Higginson, M.S.A., Carlisle and Preston, architect:—

Accepted tenders.

Bricklayer and mason:—

Hill, G.	£222 12 0

Carpenter and joiner:—

Latimer, W.	110 0 0

Slater:—

Newsom, M.	13 0 0

Plumber:—

Sowerby, G.	10 10 6

Plasterer:—

Ferguson, S.	18 0 0

Painter and glazier:—

Harkness, H.	14 14 6

DEVIZES.—For cottage and shed at Lower Old Farm, Devizes, for Mr. J. Anstie. Mr. J. A. Randell, M.S.A., architect:—

Boyce, G., & Son, and Chivers, W. E.	£365 0 0
Bilson, F., Rushall	355 0 0
McIlquham, W....	344 10 0
Brown, G.	300 0 0
Ash, H., sen.	297 0 0
Chivers, W., and Son	295 0 0
Webb, W., Bromham	284 0 0
Mullings, R. B.	275 0 0

Rest of Devizes.

EDGERTON.—For dwelling house, Edgerton:—

Accepted tenders.
Excavator and mason:—
Crowther, M. S., Huddersfield.
Carpenters and joiners:—
Batley and Wilkinson, Huddersfield.
Plumber and glazier:—
Earnshaw, A., Huddersfield.
Plasterers:—
Robinson, J., and Son, Huddersfield.
Slater:—
Jowitt, W. E., Huddersfield.
(Total cost £490.)

HALIFAX.—For dwelling-house, Edgerton, Huddersfield. Mr. J. Berry, 9, Queen-street, Huddersfield, architect:—

Accepted tenders.
Excavator and mason:—
Crowther, M. S., Fixby, Huddersfield.
Carpenters and joiners:—
Ainly and Barber, Crossland Moor, Huddersfield.
Plumber and glazier:—
Earnshaw, A., Huddersfield.
Plastering:—
Robinson, J., and Son, Huddersfield.
Painting:—
Holroyd, W. and P., Huddersfield.
Slating:—
Jowitt, W. E., Huddersfield.
(Total cost £400.)

GREAT WRATTING, SUFFOLK.—For the erection of two pairs of cottages, for the Right Hon. W. H. Smith, M.P. Mr. C. P. Ayres, Watford, Herts, architect:—

Brown, M., Haverhill...	£1,078 0 0
Mason and Son, Haverhill	993 0 0
Arber, J. C., Haverhill (accepted)...	875 0 0

KIRKHAM.—For the erection of a Wesleyan school. Mr. H. Higginson, M.S.A., Carlisle and Preston, architect:—

Croft, Preston	£889 0 0
Smith, Blackpool	825 0 0
Riley, Fleetwood	817 3 4
Baldwin, Preston	786 0 0
Gardner, Kirkham	779 0 0
Singleton, Kirkham	760 0 0
Haslam, Kirkham (accepted) ...	758 10 0

To Municipal Authorities, Engineers, and Surveyors.

JENNINGS' PATENT URINALS

FOR PUBLIC THOROUGHFARES AND RAILWAY STATIONS,

Have been adopted in all the principal European Cities. They are particularly adapted for public use, being simple in construction, strong, and most economical as regards the water supply.

JENNINGS' STONEWARE DRAIN-PIPES

Have been specially selected and adopted, after severe tests, by the South Australian Government for the drainage of Adelaide. The Sockets and Pipes are made in one piece under great pressure by Steam Machinery from the finest selected Poole Clay taken from Beds on the works, and, by hydraulic testing, have been proved superior to any other pipes in the market. *Prices and particulars can be obtained from*

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1701.

FRIDAY, AUGUST 12, 1887.

ALLEGED INJURIES TO WESTMINSTER ABBEY.

DURING the preparations for the Jubilee ceremony in Westminster Abbey, we raised our voice against what appeared to us to be a wanton crowding up of the venerable edifice with galleries and seats for the thousands of visitors who were invited to attend the thanksgiving service. A forest of timber—we should not like to say how many loads—filled the aisles, transepts, and sanctuary of the sacred building on that occasion. The aisles were occupied by tiers of galleries, the topmost of which extended to the aisle vaults, while the triforium arcade was filled with spectators. The transepts and choir were also filled with galleries arranged on a very similar plan to that at the Coronation of Her Majesty in 1838. How much injury the Abbey has suffered during these crowded ceremonials, to say nothing of previous pageants, it would be impossible to say.

One or two letters have appeared in contemporaries making serious complaints about the amount of injury to the abbey caused by the erection of the galleries, and alleging particular instances of the want of care by the workmen engaged. Owing to the publication of a letter by a correspondent of the *St. James's Gazette* on the first of this month, calling attention to various injuries which the Abbey and its monuments have sustained, we have paid a visit to the Abbey with the object of ascertaining the actual extent of the mischief which has been done. Our anticipations of the amount of injury were aggravated by what we had noticed of the immense quantity of timber in bulk and in scantlings which had been taken into the Abbey, and the hurried manner of the erection. We must admit at the onset that our examination, though necessarily superficial in character, has not justified those anticipations. We are constrained to say that, taking into consideration the immense quantity of heavy timbers that were handled and put into position, the damage done to the stonework of the structure is small, and the work of construction and taking down reflects credit on the firm of builders employed. Taking first the structure, we have scanned every portion in which the seats were fitted. In the nave there are to be seen several scratches and abrasions of the walls, diapering, broken stringcourses, arch mouldings and corbels; but from the look of many of these they appear to be old, and not recent marks. Indeed, the difficulty of saying how much of these injuries to the stonework belong to the present generation and how much to the past is very evident. Everyone who has carefully examined the interior of Westminster Abbey well knows the whole structure is full of patches of exfoliated surface, fractured stone, and chipped mouldings, yet this condition does not exonerate from blame those responsible for the Abbey in later State pageants. The very best and most careful arrangements and supervision must fail to preserve the fabric from injuries. To the repeated ceremonials of coronation—an ancient tale, as Shakespeare has said—we must attribute the present mutilated and defaced condition of the structure and monuments. On the Coronation of the Queen in 1838, much the same arrangement of seats was seen as that of the Jubilee Day, according to old engravings. All the monuments in the side aisles were encased in boards to preserve them from injury. From a description of that date we quote:—"From the west door to the screen over which the organ loft is placed [since altered and the organ divided], and which divides the choir from the nave, there were two rows of galleries erected on each side of the centre aisle, one level with the vaultings, and the other with the summit of the western door. These galleries, of which the backs rested against the walls of the abbey, had their fronts fluted with crimson cloth, richly draped at the top, and adorned with broad gold fringe at the bottom. The screen was entirely hidden under a construction of wood, which inclosed the organ and the organ loft." The triforium was filled with spectators. Proceeding to describe the choir, the writer mentions the platform covered with richest cloth of gold, upon which the chair was placed, in the crossing under the central tower. Above the altar three galleries were formed, the highest being close to the roof, holding scarcely a dozen persons, for the trumpets of the orchestra. We further learn that all the ordinary stalls, reading desks, and pews were removed to make way for the works, and in their places were erected five rows of benches, reserved as seats for the officers of State and the Household, above which were three rows of galleries, the highest being in the vaultings. The transepts had each two tiers of galleries, reaching up to the Catherine-wheel windows. It is said that more than 11,000 tickets were issued. How much damage was suffered then we do not know; but we may surmise that a very great deal more injury was sustained by the fabric then than during the last pageant.

Let us examine the present state of the interior. Scarcely a pier or shaft exists that does not exhibit the natural decay and wear of centuries. Here and there the laminæ of the stone piers are eaten away considerably below the surface, and large patches of exfoliation are to be met with everywhere, the outer skin of the stone peeling off in large pieces. Taking the interior in detail, we find the string-course of the triforium chipped in parts, and marks of hobnailed boots occur. The diaper ornament in the spandrels of arcade show patches of lighter colour, as if the surface had been scratched; but these appear to be old marks. Mr. E. Huth Walters, in his letter in the *St. James's Gazette*, says: "In the triforium arcade are numerous chips and marks of hobnailed boots. The mouldings of the principal arcade of the apse are also chipped; so is the carved diaper on the walls; so are some of the piers, not badly, but still quite visibly, even when seen from a distance. At the junction of the north transept with the north chancel aisle there is a pier bound round with cords, evidently to prevent a large piece of the capital from falling. It is already split." Our observations in the apse, or Edward the Confessor's chapel and sacrarium, discovered some chippings in the arch members and sundry slight scratchings. The effigy of the Countess of Lancaster on the north side, which the writer of the letter says has been very roughly handled, as though heavy iron tools had been thrown on it, bears certainly evidence of recent ill-usage in the drapery of the figure, and the gabled canopy of the niche is broken at the top, though it would seem not lately. The bands, *bagues*, or shaft rings round the small shafts and piers are broken in places; but there is little to indicate the damage is recent—in fact, throughout the edifice these shaft bands are much chipped and broken away, a sure witness to the fitting up of galleries for spectators on various occasions. In the nave, two tiers of these annular bands, or metal *bagues*, are introduced. These attach the four shafts to the circular pillar and are deeply moulded. In some cases there is reason to fear these bands or *bagues* have become split through uneven pressure, or through the introduction of metal into them. There is, perhaps, no English cathedral where the *bague* is so largely introduced as it is in Westminster: all the pillars of nave, transepts, and apse have them, and they are said to be of stone or brass, the former encircling the whole pier and its shafts. Mr Huth Walters directs attention to the damage done to the beautiful Italian mosaic pavement of Abbot Ware in the sacrarium. The mosaic is certainly seriously damaged by what appears to be scaffold poles or timber ends, or by tools thrown down from a height. There are clearly signs of rough usage; the mosaic in several spots on the south side has been broken away, and the bedding only remains; a loose piece of lead, as the writer says, covers a rather bad smash, that looks patched up with cement. Referring to the pier at the junction of north transept with the north chancel aisle, the second pier from the corner, the appearance is anything but satisfactory. But is this not an old eyesore? It is certainly time something should be done to remove this disfigurement from one of the main entrances to the Abbey. The shaft and capital look entirely broken away, the parts being kept together by a cord and splints, which is an ugly-looking bind.

Beyond these injuries, Mr. Walters points to a stained-glass window in the apse on the south side which he thinks has suffered damage. He says, "in the right hand light, near the head of the figure, there is something suspiciously like a hole, as viewed from the pavement below." We are very doubtful about this damage; some of the authorities ought to explain.

We must now refer to the Coronation Chair, the treatment of which is first in the list of the injuries recorded, and is justly considered the worst of them all. The general effect of the back is that of being burnt; it has all the appearance of being scorched or charred, having assumed, as Mr. Walters says, a "murky, dingy, nut-brown"; the original warm, grey tone of the ancient wood has disappeared, and with it the remains of the 14th-century decorations, executed originally in gilded gesso. We can see the uneven surface caused by remains of the gesso still adhering; but the whole seems to have been painted over with a brown paint or varnish—the entire back having the appearance of a smudgy patchiness very unlike the more natural grey tone of the companion chair, made for the coronation of Mary, Queen of William III. Then there is a gross discord perpetrated in the fresh gilded lions and base upon which the old chair stands, so entirely out of keeping with the dingy woodwork. We may notice here a description of the gilded decorations of the chair are given in Sir Gilbert Scott's "Gleanings from Westminster Abbey," written by the late Mr. W. Burges. At present nothing is decipherable in a moderately close view where the chair stands behind Henry VI.'s screen, which divides the Confessor's chapel from the sacrarium. We do not agree with general restorations of ancient buildings, but we think there is room for a little skilful treatment in this part of the Abbey. The four chapels may be left untouched, but the arcade separating the ambulatory from Edward the Confessor's chapel, which forms the apse, wants a careful examination and strengthening here and there; the wooden struts or bars between the arches at this end are very unsightly, and might be replaced. The monuments at the back of stalls in the nave are much damaged, and chips and exfoliations abound. Yet, as we have already remarked, it is extremely difficult to distinguish the old injuries and scrapings from those of recent times.

At St. Paul's, where there was ample room for the assembled visitors, the ceremony could have been as well performed and with less risk of mischief to the monuments and structure. Why was it not selected? Is precedent so strong in these observances that even so venerable an edifice as that, conse-

crated by centuries to coronation services of our kings and queens, should continue to be used for State ceremonies such as that of last June?

THE VACATION: SUGGESTIONS TO ARCHITECTURAL STUDENTS.

DURING this and the following month many of the profession who can spare the time from their daily avocations will be taking a holiday. All parts of the country will be ransacked by the younger members, and not a few will avail themselves of trips to the Continent, with the twofold object of enjoyment and profitable study. Though very few places have not been brought under contribution by the aids of pen and pencil and photography, those who seek for "fresh fields and pastures new" will soon find something in old haunts, and perchance derive new ideas from buildings and ruins which were once visited with the sole object of being sketched. The photographer, professional and amateur, both those who work for profit and for pleasure, have in no degree lessened the interest or value of sketching as one of the means of imparting instruction. A hand drawing has always a personal interest attached to it; the eye and hand have followed the lines, the mouldings, and features step by step, and the mind has, so to say, imbibed some of the original designer's feeling, till the work, whatever it may be, has been imprinted on the memory. A photograph records the impression as a whole better than a mere sketch; but in the latter only, if it be done conscientiously and truthfully, the artist can convey the sympathetic rendering of detail. Under some lights differences of surface and outline are quite lost, or appear as flat white patches, in a photographic picture; the most beautifully detailed moulding may become nothing but a flat surface of light—clear definition of surface and outline are indistinguishable.

On the other hand, labour may be immensely curtailed by substituting a photograph for a general sketch, the time so saved being spent in "detailing" the building, making measured plans and sections and notes. In this manner the photographer's art has already become a boon to the artist and tourist, and has greatly lightened the toil of the architectural student. Pictorial sketching, and finished drawings of old buildings, have on this account become less than they were formerly the object of the architectural tour, and the man who can sketch fairly, and draw plans and sections, can do as much as the accomplished delineator in acquiring accurate details.

Archæological societies, as we have pointed out elsewhere, have degenerated much of late, and have lost a good deal of their early enthusiasm and hard work. A correspondent, Mr. J. Sands, in our last issue, points out how little encouragement and aid are afforded by these societies to the individual worker in this path, how much sometimes is done to thwart his researches—a kind of forgetfulness of the original objects of these societies, arising, no doubt, from their dwindling down to mere associations of tourists, in which the interchange of compliments and indulgence in convivialities are the leading ideas. Last week we chronicled the doings and programmes of four or five different societies. The British Archæological Association are about to meet at Liverpool, a typically unpromising centre, and to organise visits to various suburbs; the Royal Archæological Institute have been busy during the week at Salisbury; the Bristol and Gloucestershire Archæological Society are holding a congress at Stratford-on-Avon; the Somersetshire Archæological Society have been making excursions into the neighbourhood of Bristol; and the Architectural Association have organised an excursion to many interesting places in Somersetshire and Wilts. There will be something to glean from such an ancient fabric as the church of Bradford-on-Avon—one of the few perfect specimens of Anglo-Saxon architecture remaining. Its very simple plan, comprising nave and chancel and a large porch, is remarkable; it is supposed to have been built about 705 A.D., and to have been attached to the Abbey of St. Aldhelm, who founded three monasteries, those of Malmesbury, Bradford, and Frome. The superficial arcading which runs round the little Bradford church, and the character of the masonry of Bath oolite, which is fine-jointed, are important features of this valley church. Another monastery chapel, Hinton Charterhouse, of 13th-century character, will attract notice for its perfect state, small size, and Early English details. The manor house was built doubtless from the remains of the priory, which is now a ruin. At Wellow Church, Somersetshire, will be found many interesting details, including a very good Early English type of font surrounded by shafts. For architectural details, Shepton Mallet, Frome, Ilminster, Keynsham, Doulting, Fifield, Fisherton, near Salisbury and Devizes, afford excellent hunting ground.

One very important source of information in connection with old buildings, that also can be made an interesting digression by those who seek holiday and rest, is geological formation and local materials. There are not ten out of a hundred tourists and students who bring home with their sketches any note of local materials and local peculiarities of workmanship. The Somersetshire hills form grand quarries. Within a few miles of Gloucester may be found freestone of fine grain, compact, oolitic in structure, and durable, capable of being used for carving. Stroud, Minchinhampton, Bathampton, Chippenham, and Doulting are quarries from which the stone of the great churches of the West of England has been obtained, amongst them Bath Abbey Church, Wells Cathedral, and Glastonbury Abbey Church. These are all in fair preservation. Again, the light brown oolite of Barnack, in Northamptonshire, is part of the great limestone range, which is noticeable as the building material of many of the beautiful churches of that county. In Lincolnshire there is a brown or rich warm oolite, used in Lincoln Cathedral, Grantham parish church, and a variety of other well-known buildings. So, again, near Bristol—all students must have noticed the hard bluish-grey stone quarried at Fishponds, near Bristol; the greenish-brown sandstone of Tisbury, in Wiltshire; and the warm red sandstones of Nottinghamshire, which colours very strongly distinguish the buildings of each district. This matter of colour has much to do with our impressions of the counties we visit, and, from an artistic point of view, is of consequence. We have known sketches made of buildings without any notes or indications of structure to enable anyone to tell whether they are stone or brick. The prevalence of brick in some localities and its scarcity in others is a point of vital importance. Structural peculiarities, dependent on material and method of working, are things which the least artistic amongst tourists may notice without much labour to themselves. In nearly every great district we may find peculiar features. Take, for example, the church towers. In Gloucestershire and Somersetshire we have fine towers of Perpendicular character; in Northamptonshire, towers with spires; in Kent, low, sturdy-looking towers, with angle stair turrets and clerestory-less churches; in Norfolk and Suffolk, the circular tower and flint masonry relieved by flush dressings of stone. Still greater diversity will be found in domestic buildings where local materials have developed styles of singular variety. The natural landscape and scenery have had some influence on architecture, though less marked. What style and features have been most favoured in certain localities would be an interesting inquiry. In the hilly and wooded districts of the West and South one may expect to find different forms of roofing and features to those that prevail in the flatter districts of the Midland and Eastern Counties, though of these modifications due to scenery we have nothing published to guide us. The building stone—its abundance, hardness, or softness—has always been a powerful factor in determining elaboration or richness of style. Thus, it will be observed, the more florid and Perpendicular styles of Gothic have flourished more in districts where good freestone is abundant, very little in districts where stone is scarce, and scarcely at all where granite prevails. Visits to quarries, to factories, to large building firms' works form no part of the programmes of those who take tours; they would probably be thought to smack more of business than of pleasure; at the same time they would be more profitable than desultory loitering in one old church, or aimless saunterings under the guidance of a county handbook. Organised excursions planned before starting give time and opportunity for sustained study, and we have lately indicated in a prize paper one or two routes of interest to the architect and artist. To students we would recommend the saving of much time, or the profitable expenditure of that at any chosen building, by taking with them plans or outline maps of noted buildings and districts that may be accessible before starting, by which the filling-in of details will be facilitated. Hundreds who yearly go away do so without preparation, without even having mastered superficially the topography of the district to be visited and its chief features.

NATIONAL COMPETITION OF WORKS OF SCHOOLS OF ART.—II.

WE now resume our notes of prize designs and drawings, oil and water-colour studies, on view in the Museum at South Kensington. The chalk drawings of figures from the antique are not quite so strong as they have been in previous exhibitions. A Birmingham student, Ernest G. Treglown, wins a silver medal; the same distinction is won by James Riddel, of Edinburgh; by Clare B. Ashton, Manchester; and John Hamer, South Kensington. Three silver medals are given to students of the Training Class at South Kensington for works in the same stage. The chalk drawings of heads from life represent excellent work. We notice a chalk study of figure and drapery, a head of girl, by Clara Atwood, Chiswick; also by Sarah Thomas, of the same school, a study of man's head, side view, very darkly shaded. Other figures are by Louis Cockrell, Hilda K. Robinson, John Shields, for which bronze medals are awarded. Honorary awards are well merited by Robert B. Dawson and F. Stead, the latter for a woman's head under strong light and shade. Arthur Garrington, Bristol, sends a boldly-drawn charcoal study from the antique (silver medal).

The drawings of figures from the nude are consigned to a part of the court by themselves, dictated, no doubt, from the British Matron's view, though the authorities could hardly have done more to excite a prurient curiosity from such a course. If it was thought necessary, from feelings of delicacy, to place these studies by themselves, why was not the same course followed with the models of figures from the antique, which are publicly exhibited in the open part of the court, and are quite as much, if not more, open to the like censure, and which equally disregard the modesty of those who frequent the court? The fact is that a promiscuous interminglingling of these works with other drawings and studies of the figure would have been less likely to invite the attention of those for whose eyes they were not intended. The studies show

different attitudes and effect of light and shadow, the body at rest and in motion, in exercise, and in other employments. One gold medal is awarded to Hilda K. Robinson, South Kensington, who wins also the Princess of Wales Scholarship for a figure of a woman leaning, her feet crossed, and three other studies. Charles T. Dodd receives an honorary award gold medal for studies of male figure in different attitudes. Kate Andre, South Kensington, and John Lee show studies; the latter has a silver medal for a figure of a man, one foot raised. A silver medal is awarded also to George Robertson, St. Martin's, for a back view of male figure and a seated figure, both drawn with skill, and showing good modelling and anatomical study.

A few good drawings are placed so close to existing screens that they cannot be viewed, or are very imperfectly lighted. We notice Nos. 197, 69, 72, 368. John Collins, a Birmingham student, takes a silver medal for studies of much merit; and Maud Hiley, Manchester, for a seated figure, displaying careful study of form and modelling. Albert John's anatomical studies, and Oliver Silk's, Liverpool, of male figure, both take silver medals. The oil studies of the nude include one or two admirable works. L. M. Kilpin, West London, and Philip Hall send careful studies, the former a partially-turned figure of a woman.

The oil-colour groups do not take the high place in the exhibition which we had anticipated; the subjects selected are not very happy as a rule. These groups are given to exercise the student's power of rendering light and shadow, colour and texture, and in one or two instances the results are satisfactory. No gold medal has been taken in this stage. Walter Freeth, Birmingham; May Elizabeth Sumner, Lincoln; and Philip Hall, a training student, take silver medals. We notice one very pleasing group consisting of a broken red earthenware jar, roughly painted green, with dark drapery background, for which Ethel Buckingham, of Norwich, receives a silver medal; also one painted by Gertrude E. Offord, Norwich. The colouring of broken jar and accessories is harmonious, and the textures painted with skill. Gertrude Howes, of the same school, sends a cleverly executed group of the same in water-colours. George Percival Gaskell, Ilkley, shows a group in quiet colour; and Haywood Rider, South Kennington, a trophy of bronzes and fan. Kate Young, Southampton, has a group representing a table, basket, loaf, &c., a promising work; and, from the same town, we must notice F. V. Poole's ornament from cast in water-colour—a monochrome study in sepia—the subject, a panel, with foliage in relief carved, executed with much delicacy and feeling. Both take book prizes. Another excellent monochrome in water-colour, of ornament, is by Patrick O'Sullivan, Cork, a bold scroll of Classical design, to which a silver medal is awarded. Edith Edwards, North London, sends a water-colour (monochrome) study of a head from the antique, displaying a skilful handling in the shaded face; we must also mention a monochrome drawing of ornament from cast by Bessie Gough, Bristol, a honeysuckle enrichment in architrave, and a monochrome in sepia by Constance Ethel McCabe, Ryde, of a small spandrel with folial ornament in relief. A monochrome in oil of mask from the antique is sent by Ada Howell, North London. We must also notice the gold medal monochrome oil-colour and tempera ornament, by William H. Allen, of South Kensington, a pilaster ornament from the cast, a folial design; two other studies on blue ground, and a monochrome oil-frieze by Thomas McKeggie (bronze medal), on red ground, refined in treatment; also a panel on green ground, by Paul F. Maitland, of delicate treatment, may be named. A few designs and drawings we omitted to mention in our first review. Of these we may notice a design by Henry C. Morrow for a frieze by Dosso Dossi, on yellow ground, in oil. A figure design for frieze, by John M. Nichols, looks rather straggling. A quiet, delicately-treated, and nicely-toned design for wall paper, with foliage adaptation, by Amy E. Woodall, West London, receives a bronze medal; and George Redfern's (Manchester) flock paper in light citron colourings may be noted. Alfred W. Weatherstone's figure designs—one for a frieze with figures in blue ground is exceedingly refined and harmonious in colour; and Adele Muller's figure composition for majolica vase is suggestive. A neat drawing of parvise of Peterborough Cathedral, by William H. Lord, of that city, takes a bronze medal; and we must also mention William Townsend's (Derby) drawings of gates executed in 1725. Several very creditable groups in water-colours are hung. Catherine Kitson, Bloomsbury, is awarded a silver medal for studies of flowers and grass, and Paul Holden a bronze medal for flowers without a background, and Charlotte Alston sends a charming spray of pink mayblossoms. We hope that the next exhibition of designs and drawings will find a more convenient room for hanging, as it is impossible, from the arrangement of the works between permanent screens of the court, to follow consecutively any particular stage, and many works are so mercilessly "floored" that they are not seen at all. The classification appears only intended to bewilder.

ANCIENT EGYPTIAN TEXTILES AT THE SOUTH KENSINGTON MUSEUM.

FOR some time past the textile collections at South Kensington have been in course of rearrangement, and the valuable series of examples of weaving, embroidery, and lace have recently been brought together in a gallery under the new library. Students of decorative art are scarcely alive to the fact that in these collections a veritable storehouse of design has been accumulated for their use. In almost any country on the Continent such a museum would be thronged with the representatives of manufacturers eager to turn these specimens to practical account; but here in England the visitor passes through the gallery unconscious alike of the beauty of the fabrics and of their value to the designer and to the art workman. The collection of Dr. Bock, of Aix-la-Chapelle, which was purchased for the museum some ten or twelve years ago, has from time to time received important additions from other sources, and now we have to record the acquisition of a series of ornamental textiles from Akhmîm, on the banks of the Nile in Upper Egypt, which consists of over 300 specimens, the fabric being in every case of linen, and the ornament wrought in tapestry, in some instances enriched also with needlework or embroidery. Although but few complete garments have been obtained, there are ample indications of the derivation of the panels and borders, which form the bulk of the present collection. The Arabs, when they rifled the ancient burial ground of Akhmîm (Panopolis), cut out from the shrouds and tunics in which the bodies of the dead had been wrapped all the decorative details, and these are for the most part in a wonderfully good state of preservation. We have here portions of the grave clothes and garments of the dwellers in this part of Egypt during a period which has been estimated to extend to little short of eight centuries, say from the 1st century of the Christian era down to about the year 800. The interments took place in the dry sand, which prevented the tapestry work from decay for upwards of 1,300 years, and it is possible to recognise every stitch and thread in tunics and ceremonial cloths which date back to the Roman occupation of Egypt. It is needless to observe that our knowledge of the textile fabrics of that date is extremely scanty, and that the specimens thus obtained will throw a new light upon manufactures and processes concerning which much has been hitherto a mere matter of conjecture. The garments which have been obtained entirely represent, no doubt, the ancient tunic, in its simplest form—a short-sleeved, loose-fitting coat, resembling the herald's tabard, or the church dalmatic. The ornament consists of strips, or bands, passing over each shoulder, vertically down the front and back, of pattern or panels on the shoulder, and sometimes on the breast and back, with cuffs or narrow bands surrounding the sleeves. In the woollen tapestry-woven ornament, we find a prevailing purple tint in several shades, but occasionally the use of several colours may also be remarked. The colouring of some of the later examples, which are supposed to be of Christian Coptic origin, is much more varied than in the earlier work, where a Roman influence is clearly manifest. The bands (*clavi*) are enriched with leaves and foliage, and with quaint animal forms; the panels (*adjunctæ tabulæ*) are in many cases of elaborate design, an excellent effect being obtained by stitches of embroidery on the surface of the woollen tapestry. Many of these examples recall vividly, both in the style of their enrichments and in the manner in which the ornamental forms are conventionalised, the treatment of the Roman mosaic pavements, and it would seem almost as if the same limitation of the material which evoked certain degraded forms of ornament in mosaic work had led the tapestry weaver to produce precisely the same effects in the loom. The linen which forms the groundwork of the majority of these specimens is coarse in quality, and appears to be unbleached. Certain of the examples present us with a fabric of the nature of rough towelling, or one which has the threads looped up on either face, like the material known to housekeepers as "Turkey towelling." There are strong signs of a gradual decay in the art instincts of the race by whom these works were produced, and we find, along with the vigorous and tasteful ornament which has either a Greek or Roman character, some debased and degraded types of art which remind us strongly of the specimens of manuscripts and embroideries brought back by the Abyssinian expedition against the ill-fated King Theodore. Here we often find Christian emblems and forms which record stories of the saints and martyrs of the Eastern Church. The fabrics were no doubt produced by the Coptic Christians as late as the 8th and 9th centuries, when the latest interments must have taken place about the period of the Arab conquest. The collection is at present in process of being framed for exhibition, and only a small portion of the specimens are available for public inspection, but the examples now shown are no doubt of the greatest possible interest and value.

BUILDING MATERIALS.*

By W. Y. Dent, F.C.S., F.I.C.

(*Concluded from p.* 229.)

IT is probable that we do not yet fully realise what a serious effect on the durability of many of the iron structures that have sprung up within the last forty years may be produced by this liability of iron to rust, because a number of years must elapse before such massive structures, as many of them are, become sufficiently weakened to render them dangerous; although it would seem from Mr. Clark's report, made in 1878 relative to the condition of the Britannia tubular bridge in reply to some alarming statements which had appeared as to the injuries it

* Being the Cantor lectures delivered before the Society of Arts.

had sustained from the rusting of the iron, that where proper care is taken to preserve the iron there need not be much ground for uneasiness, since the report states that during a period of twenty years the entire loss from the whole mass, about 10,500 tons, did not exceed 1lb. in weight. This rusting or combination of iron with oxygen results from the exposure of iron to the combined action of air, moisture, and carbonic acid. That moisture plays an important part in the oxidation of iron is proved by the fact that a piece of steel is rapidly corroded when exposed to the influence of a mixture of moist oxygen and carbonic acid, whilst but little, if any, effect is produced upon it by the dry gases. The influence exerted by the presence of carbonic acid is probably due to the tendency it would have to induce the formation of a carbonate of the protoxide of iron or ferrous carbonate, which is subsequently converted into a hydrated peroxide. It is well known that the tendency of two substances to combine with each other is increased by the presence of a third substance, which exhibits a powerful attraction for the compound resulting from their union. We have a familiar example of such action in the formation of saltpetre (potassium nitrate), which takes place under favourable circumstances in soils containing potash and nitrogenous organic matter, the union of the nitrogen with the oxygen of the air to form nitric acid being promoted by the presence of a powerful base, such as potash, for which the acid has a strong affinity. The advantages derived from the use of lime in agriculture are to some extent due to a similar cause, the beneficial effects resulting from the application of lime being most evident when it is applied to newly broken-up ground or soils containing a large quantity of vegetable matter, the decomposition of which is promoted by the presence of lime inducing the formation of organic acids with which it combines. The well-known protective influence which lime or any caustic alkali exerts in preserving iron from rust is to be attributed in a great measure to the absorption of carbonic acid. The coils of fine iron wire used in deep sea soundings (any rusting of which would be of serious consequence) must necessarily, for obvious reasons, be put away whilst they are wet, and therefore under the most favourable conditions for rusting; but they are preserved by being stored in a solution of caustic soda. Lime is also very commonly employed for preserving articles made of iron. It is well known that when iron has once begun to rust its corrosion proceeds with increased rapidity. This may be due partly to the porosity of the oxide of iron formed, which causes it to absorb moist air more rapidly, but principally to the galvanic action arising from the porous oxide acting the part of an electro-negative element, and the metallic iron that of an electro-positive element, whilst the moisture absorbed performs the function of the exciting liquid in the cell of a galvanic battery. Hence we see that in order to preserve iron from being destroyed by rust it is essential that every particle of rust should be removed as soon as it is formed, and that the smoother, brighter, and more polished the surface of the iron can be maintained, the better will it be able to bear exposure to oxidising influences. Besides the serious effects produced by oxidation upon iron structures, which, of later years, have grown to such vast importance, the products resulting from the oxidation of iron possess a special interest in connection with the subject of stone, inasmuch as the oxides and other combinations of iron form the chief colouring matter of all rocks. In some cases, such as flints, which become white when calcined, the colouring matter is of a carbonaceous character; in other cases, the colour may be due to manganese, chromium, copper, as well as other metals, but the presence of these is rare, as compared with the oxides and other compounds of iron which are almost always present, giving rise to a variety of colours, including black, blue, grey, green, as well as every shade from light yellow to a deep red. The hard kidney-shaped nodules which are found in the red hæmatite ore of Cumberland consist of pure anhydrous peroxide of iron, whilst the brown ores, such as those of Northamptonshire, consist of the hydrated oxide, and in the well-known magnetic iron ore of Sweden we have the black oxide. Black oxide of iron is produced when steam is passed over iron at a red heat, the vapour of water being, under these conditions, decomposed, the oxygen combining with the iron to form the black or magnetic oxide, and the hydrogen being evolved as gas. This reaction has been utilised as a means of obtaining hydrogen gas on a considerable scale for filling balloons, and also for producing a coating upon iron which will protect it from further oxidation. This method of preserving iron from rust was made the subject of a patent some years ago by the late Professor Barff, and the process has been successfully carried out with respect to articles that are capable of being subjected to a high temperature without injury. The iron to be preserved, which must be clean and free from rust, is placed in a chamber which is heated to a temperature of from 1,000° to 1,200° Fahr. Steam is generated in a boiler under a pressure of about 30lb. on the square inch, and superheated by passing through a series of wrought-iron pipes protected from the effects of the fire over which they are placed by others of cast-iron. When the chamber is filled with the articles to be operated upon (which may consist of either wrought or cast iron), the door is closed, and the temperature maintained chiefly by the steam admitted for a period of from three to five hours. Another method of preserving iron from rust by means of a coating of this unalterable black oxide has been patented by Mr. George Bower, which consists in passing the hot gases produced by the combustion of fuel over the iron, instead of steam, mixed with a proportion of air, which is increased or diminished according to whether an oxidising or reducing effect is desired to be produced. If the iron be rusty, a reducing flame converts the red oxide into the black or magnetic oxide. In the case of wrought iron that is not rusty, Mr. Bower prefers to produce in the first instance a little red oxide by increasing the quantity of air, as he finds that the black oxide finally produced is rendered thereby less liable to scale off. Barff's process is best adapted for polished steel or wrought iron; Bower's for cast iron and rusty iron. The two processes are now combined, and frequently articles are subjected first to the heated gases produced by combustion, and finished by superheated steam. There can be no question as to the success of the process as regards the smaller descriptions of iron goods, for when properly conducted, iron will bear exposure to the atmosphere under the most trying conditions without a particle of rust being produced, and if specks of rust should make their appearance on spots that may not have been thoroughly coated with the black oxide, the rust shows no tendency to spread. This process is specially adapted for intricate castings, as the gas penetrates the finest lines, producing a thoroughly protective coating. As a means of preparing articles for gilding, it has been of great assistance in overcoming the difficulty previously experienced in coating iron so as to prevent it from rusting, and as a necessary consequence throwing off the gilding. The unavoidable expense incurred in heating large masses of metal to the required temperature renders it difficult to apply a process of this kind to heavy castings, neither is it suitable for protecting wire, because the coating, being of a brittle character, breaks off when the wire is bent, unless the coating is too thin to afford efficient protection to the wire. There is a difficulty in applying it successfully to nuts and screws on account of the oxide filling up the threads to such an extent as to prevent their working satisfactorily, neither can it be considered a suitable process for chains, the links of which, by friction against each other, soon rub off the coating of black oxide. The necessity of raising the iron to a red heat is also a bar to the use of this process in many cases in which otherwise it would be invaluable as a preventive of rust. The process ordinarily adopted for preserving iron from rust, termed "galvanising," consists in immersing the iron in a bath of melted zinc, and thus covering the iron with a coating of zinc, which rapidly oxidises on the surface; but under ordinary circumstances the oxide formed remains firmly attached to the metal, and thus protects it from further corrosion. It has lately been proposed to deposit the zinc electrically upon the iron, a process which is said to be successfully carried out at a less cost than the ordinary galvanising process. The effects produced by carbonic acid are most strikingly exhibited in its solvent powers as regards the carbonate of lime, carbonate of magnesia, and protoxide of iron. Many natural waters contain ferrous carbonate in solution, more especially those known as chalybeate waters, and from such water, when exposed to the air, peroxide of iron is deposited by the oxidation of the ferrous carbonate. The hard waters obtained from the chalk contain lime held in solution by carbonic acid, and the softening of such water by what is known as Clark's process consists in adding just sufficient lime to neutralise the carbonic acid that holds the carbonate of lime in solution, when the whole of the lime existing as carbonate is precipitated, the water being softened down to about one-third of its original hardness, an immense advantage in water required for domestic purposes. It is the solvent action of carbonic acid upon carbonate of lime that gives rise to those magnificent incrustations that occur in the caverns of limestone rocks, such as are found at Clapham Cave in the north of Yorkshire, Castleton in Derbyshire, and the Kitcraft Quarry in the Isle of Portland. These incrustations frequently take the form of icicles hanging from the roof, when they are known as stalactites, which are sometimes several feet in length. The pillar-like masses rising from the floor are termed stalagmites. The incrustations are produced by the rain water, which, charged with carbonic acid, percolates the limestone beds, and dissolves in its progress the carbonate of lime. When the water saturated with carbonate of lime reaches the roof of a cavern and becomes exposed to the air, it loses some of its carbonic acid, and a particle of carbonate of lime is deposited, and when the drop reaches the floor, a further deposit of carbonate of lime takes place, owing to the escape of carbonic acid, until, after the lapse of time, large masses of these deposits are accumulated. A very remarkable example of the formation of incrustations of this description during a comparatively short period of time was discovered when widening the north bridge at Edinburgh connecting the old town with the new. Between the arches of the bridge and the roadway were a number of chambers or vaults, varying in height, and from 8ft. to 10ft. in breadth, which had not been opened since the building of the bridge, 100 years before. From the vaulted ceilings of these chambers (especially from the joints of the masonry) hung hundreds of delicate sparry crystals of snowy whiteness; many of these reached the floor, forming slender, thread-like pillars resembling a grove of brittle canes, some of these pillars being as much as 6ft. in length. A large number of little stalagmitic mounds, each surmounted by a short, slender stalk, were also observed, which were evidently the lower ends of what once had been continuous pillars. The bridge was built of sandstone, and this curious formation had been produced by water, which had trickled through the masonry, and had thus become saturated with carbonate of lime from the mortar in the joints. The solubility of carbonate of lime in water charged with carbonic acid not only gives rise to these very remarkable and curious incrustations, but exerts a very considerable influence upon geological limestone formations, the insoluble carbonate of lime being deposited as a sedimentary rock. The white concretionary limestone, known as travertin, of which both ancient and modern Rome are largely built, is an example of such a deposit which is taking place in some parts of Tuscany at the rate of six inches a year. Carbonate of lime being deposited from its solution in carbonic acid, serves to bind together other materials with which it comes in contact in the course of such deposition; it thus serves as the binding material of several varieties of building stone, and becomes an important agent in the formation of rocks. An excellent example of such formation is to be seen at Bermuda. The islands are surrounded by immense beds of calcareous sand to the extent of twenty miles, resulting from the disintegration and breaking up of the coral reefs which abound in that part of the world. This sand is washed up by the sea, caught by the prevailing winds, and blown up into hills 40ft. or 50ft. in height; the rain falling upon these calcareous deposits dissolves out from the

upper portions carbonate of lime, which is again deposited as the water percolates the drift, and binds together the particles of sand, as well as other *débris*, into a coherent mass, which gradually hardens into a rock. Under normal conditions of the atmosphere, the agents which tend to alter and decompose whatever is subjected to their influence are few in number and comparatively slow in their action, deriving the enormous power they exert from the persistency of such action through long periods of time ; but this can hardly be said to be the case as regards the atmosphere of our large towns, and especially of those in which extensive manufacturing operations of various kinds are carried on. The air of such towns becomes charged with substances of a much more deleterious and corrosive character than those which I have described as belonging to the atmosphere in its normal condition. In the neighbourhood of alkali works, potteries, and other manufactories where large quantities of common salt are decomposed, the air is liable to contain appreciable quantities of hydrochloric acid, although the amount of this highly corrosive mineral acid that is now allowed to escape into the air is very much less than was formerly the case before the Alkali Act was passed, which enforces the condensation of all acid fumes as far as practicable. The sulphuric acid, either in a free or combined state, existing in the air of towns, is of more serious consequence than the hydrochloric, not only on account of its existing in much larger quantities, but because it is derived, in a great measure, from the sulphur contained in the coal burnt for domestic as well as other ordinary purposes, so that no extension of the Alkali Act could relieve us from this impurity. The total consumption of coal in all large towns is enormous, and when we consider that the greater part of this coal contains from a half to two per cent. of sulphur, we must see what a vast quantity of sulphuric acid is likely to be produced from this source. Taking the average quantity of sulphur in coal as amounting to one per cent., we have one ton, or 2,240lb., yielding 22lb. of sulphur, which, by absorption of oxygen, is capable of producing 67lb. of oil of vitriol. The late Dr. Angus Smith, who for several years carried out a long series of investigations on the impurities existing in the air of large towns, found the air in some parts of Manchester to contain as much as from 800 to 1,200 grains of sulphuric acid (either in a free or combined state) in every 1,000,000 cubic feet, and from 100 to 150 grains of hydrochloric acid, either as such or as chlorides. The presence of this large amount of acid matter existing in the air was corroborated by the quantity found in rain water ; the mean result of a vast number of experiments, conducted through a whole year, gave an average of from three or four grains of these acids, either in a free or combined state, in an imperial gallon. In parts of London where coal is consumed chiefly for domestic purposes, 730 grains of sulphuric acid, either as such or in combination, were found in 1,000,000 cubic feet of air. To whatever extent these acids may be neutralised by combination with the ammonia, or other alkaline matter with which they come in contact, there can be no question but that the sulphuric acid (either in a free or combined state) existing in the air of towns is very detrimental to many descriptions of stone, and altogether precludes the use of such a material as Caen stone for the exterior of buildings which are so situated as to be liable to be exposed to its influence. On examining the crumbling surface of Caen stone from buildings in large towns it has been found that the decayed portions of this stone contain a considerable quantity of sulphate of lime. Dr. Angus Smith found mortar in Manchester in which the lime had been to a large extent converted into sulphate, and on examining the black deposit which collects in the hollow spaces between the stones on the walls of St. Paul's Cathedral, I found it to consist of particles of sand and other *débris* (which no doubt had greatly assisted in producing abrasion of the surface of the stone), soot, together with a very large quantity of sulphate of lime. When this crust remains firmly attached to the stone the policy of removing it may be questionable, as it probably serves to protect the surface of the stone from further action. The amount of acidity acquired by rain in large manufacturing towns is sufficient to cause it to act rapidly upon galvanised iron roofs unless protected by paint. The zinc oxide which under ordinary circumstances remains attached to the metal is readily attacked by weak acids, and if subjected to the action of acid rain, the zinc coating is rapidly destroyed, and the surface of the iron is exposed. It has been proposed to use iron covered with lead for corrugated roofs which are subjected to the influence of a smoky atmosphere, as being less easily attacked than the zinc. In galvanising, the iron simply requires to be immersed in a bath of melted zinc ; but lead will not attach itself to iron under similar stated circumstances. This difficulty is stated, however, to be overcome by mixing with the lead a small quantity of phosphorus and arsenic. This method of coating iron was made the subject of a patent in America and in this country three years ago. Having considered the nature of the influences to which stone is liable to be exposed which tend to promote its destruction, let us now turn our attention to the chemical composition and physical structure of the various descriptions of stones used for building purposes, and their relative capability of resisting exposure to such influences as have been described. Of these a block of hard and compact well-polished granite is unquestionably one of the most durable. To be hewn out of the solid rock has in every age been regarded as typical of endurance, and the word granite is so associated in our minds with all that is lasting and permanent, that to speak of any building as being constructed of granite is considered to be a guarantee of its strength and durability. The term granite is understood by geologists to indicate a rock consisting of quartz, felspar, and mica in a crystalline granular condition, which may be associated to a greater or less extent with other minerals, such as hornblende, talc, schorl, &c., which give rise to a number of rocks differing in their composition and character, and distinguished from each other by various names, derived either from that of the prevailing constituent or from the localities in which they were first known. Thus we have talcose granite, in which the quartz, felspar, and mica are associated with talc ; hornblende, or syenite-granite, in which the mica is more or less replaced by hornblende. The word syenite, derived from Syene in Egypt, whence was first obtained the beautiful material so largely used by the Egyptians for obelisks, and other architectural purposes, has been hitherto understood to represent a granite in which the mica has been replaced by hornblende ; but this term is now restricted by geologists to a rock consisting of a crystalline granular mixture of orthoclase and hornblende. Of the three constituents of typical granite, quartz offers the greatest resistance to any weathering action. When it exists in the form of hard colourless crystals (commonly known as rock crystal) it is pure silica. The crystals, however, frequently assume various shades of colour, according to which they have received appropriate names, such as rose quartz, milk quartz, the amber-coloured crystals being known as cairngorm stones, from having been found in the Cairngorm Mountains of Aberdeenshire. Silica in this highly crystalline condition resists the action of almost every chemical reagent with the exception of hydrofluoric acid, but it can be made to combine with an alkali by the assistance of heat. Felspar, as represented by the mineral orthoclase, consists of silica, alumina, and potash, and of silica, alumina, and soda, as represented by the lighter coloured mineral albite. Lime also enters into the composition of some felspars, such as oligoclase, which contains 2 per cent. of lime, and labradorite, which contains from 10 to 12 per cent., this last being an opalescent felspar, exhibiting a peculiar iridescent display of colours when the light falls upon it in certain directions. Mica, so named from its being easily divided into glistening scales, consists of silica and alumina, associated with magnesia, soda, and lime in varying proportions ; thus we have potash mica, consisting of silica, alumina, and potash ; and magnesia mica, in which the alumina is partially replaced by magnesia, passing (as the proportion of magnesia increases) into soft talc, which is chiefly composed of silica and magnesia. The term granite, as commonly employed, is used in a much more comprehensive sense than belongs to it legitimately as understood by geologists, for under this general term are included many hard crystalline rocks which differ in their composition from true granite, the so-called granites of Leicestershire, Guernsey, and Jersey, as well as that of the Malvern Hills, partaking more or less of the character of syenite. The several descriptions of granite differ materially from each other, both as regards their composition and physical structure ; while those which are well crystallised are extremely durable, there are some granite deposits which possess but little cohesion, and readily yield to the influence of atmospheric changes. In several districts examples of granite of this lalter description are to be found, but there are none so remarkable as those which exist in Cornwall, where some of these granitic deposits are in such a friable condition that a slight blow is sufficient to make the mass fall to pieces, forming the deposit known by the name of china stone, whilst in other parts the decomposition of the felspar of the granite has proceeded to such an extent that the deposits have become converted into china clay or kaolin, so named from two Chinese words signifying a high ridge. The natural china clay contains crystals of quartz and flakes of mica, with sometimes a little schorl and undecomposed felspar ; it is covered with a layer of sand, stones, and impure discoloured clay, varying from 30ft. to 40ft. in thickness, which it is necessary to remove before the clay can be worked. The broken-up clay is exposed to the action of a stream of water, which, carrying off the finer portions in suspension, is led through long channels (in which the sand and rougher particles are deposited) into large pits from 30ft. to 40ft. in diameter, and from 7ft. to 10ft. in depth, in which a further deposit of the heavier particles takes place ; it is finally conducted into tanks in which the fine clay held in suspension by the water is allowed to deposit, the effluent water being sometimes collected in reservoirs to be used over again. The clay, which is of the consistency of soft mud, is removed from the tanks to the drying floors, which are formed of fireclay tiles heated by flues. It is spread upon these floors to a thickness of from 6in. to 9in., and when dry constitutes the kaolin or china clay of commerce, as supplied for the manufacture of porcelain and other purposes. This china clay is prepared on an extensive scale, the larger works turning out as much as from 3,000 to 8,000 tons per annum. The first china or "hard" porcelain (by which is meant a porcelain capable of bearing a high temperature without fusion) made in Europe was that manufactured at Plymouth by Mr. Cookworthy, who discovered this clay at St. Stephen's, in Cornwall, in 1755. The clay is largely used as a dressing for calico, by paper-makers, to give body and weight to their goods, and in the manufacture of ultramarine blue. Extensive deposits of this clay exist in China, America, in the north of France, and in the island of Bornholm, which supplies the clay required by Sweden, Denmark, and the north of Germany. The constituent of granite that is generally the first to undergo decomposition is the felspar, although there are cases in which the felspar stands out in sharp well-defined crystals, exhibiting quite as little tendency to decay as the other portions of the rock. In decomposing, the crystals lose their lustre, and as the disintegration proceeds, the potash and soda are washed away as soluble salts (for the most part as carbonates), leaving a hydrated silicate of alumina constituting the kaolin that remains. Experiments have been made which show that under favourable circumstances carbonic acid exerts an appreciable amount of action upon a variety of minerals, such as hornblende, serpentine, or apatite, and that this action is augmented by increased pressure. With respect to the origin of the enormous deposits of crumbling granite, such as those found in Devonshire and Cornwall (covering as they do a large area of ground, and having in some places a depth of more than 100ft.), no very satisfactory explanation can be given. The clay in some cases rests upon granite of the hardest description, and it is the opinion of the best authorities that these deposits have either never been properly consolidated or that they are the results of surface de-

composition which have been swept by the action of water into the spots which they now occupy. In selecting stone for building purposes, too much attention cannot be paid to its physical structure, inasmuch as whatever may be its composition, stone which is of a hard, dense, crystalline character is not only capable of resisting more effectually the action of erosive agents when in actual contact with them, but is not exposed to the same amount of contact as is the case with stone of a more porous character, for when rain falls upon a close, polished surface it cannot sink into the stone, and, consequently, any matter of a corrosive nature with which it may be charged does not remain in contact with the stone for any length of time, but is carried off before it has had an opportunity of exercising an injurious effect. It is obvious that the more crystalline and compact is the character of the stone, the more capable is it likely to be of resisting the effects ordinarily produced by exposure to atmospheric influences, whether such may be of a normal description, or whether they may be of a more powerfully corrosive nature. It is to its physical structure alone that marble (which consists of carbonate of lime) owes its durability; its highly crystalline character rendering it sometimes capable of being favourably compared with granite, as is the case in some of the churches of Devonshire erected from 400 to 500 years ago, in which the marble shows fewer signs of alteration than the granite. The importance of crystalline structure, as affecting the durability of stone, appears to have been recognised from a very remote period. Whoever the constructors of the great Pyramid may have been, and whatever purpose they had in view in carrying on a work involving such an enormous amount of labour, it is quite certain that they must have been proficients in the art of building in stone. They appear to have exhibited much skill in its selection, and were acquainted with the best methods of dealing with large blocks, fully appreciating the advantages to be derived from fitting such blocks as closely together as possible with very thin joints. The celebrated red porphyry of Egypt, which derived its name from its purple colour, was hard enough to be capable of taking a fine polish, and was largely used by the Egyptians, and subsequently by the Romans, for statuary purposes. It was upon a circular slab of this material, now at St. Peter's at Rome, that the Roman Emperors were crowned. Columns of porphyry, after the lapse of 1,900 years, still exist which retain their freshness of colour. The term porphyry is now applied to any rock having distinct crystals embedded in a felspathic matrix, and is used to designate the crystalline character of a rock. We have thus quartz porphyry, porphyritic granite, porphyritic greenstone. Cornwall is especially rich in these porphyritic rocks, a very excellent material, capable of taking a high polish, being obtained from the neighbourhood of Bodmin. It was a schorlaceous variety of this description which is found on the surface in immense boulders near Luxullian, and hence known as luxullianite, that was selected for the sarcophagus of the late Duke of Wellington in St. Paul's Cathedral. The very perfect condition in which works of art of such great antiquity as those of Egypt have been found is no doubt mainly due to the dryness of the climate of Egypt; but still, in part, to the excellent quality of the material employed. The syenite granite of Egypt was extensively worked as far back as 1300 years B.C., the quarries whence it was obtained occupying an extensive tract of land between the first cataract of the Nile and the town of Assouan, which now stands near the site of the ancient Syene. The famous Egyptian obelisks, one of which, known as Cleopatra's Needle, originally erected at Heliopolis (the "On" mentioned in the book of Genesis) about 1800 B.C., and now standing on the Thames Embankment, were obtained from these quarries. The obelisk at Rome was one of those that stood in front of the Temple of the Sun, where it is said to have remained for 2,000 years before it was removed to Rome by Cæsar Augustus after the battle of Actium. It is somewhat remarkable that the neighbourhood of this ancient Syene, which for thousands of years had been the frontier town dividing Egypt from Nubia, should now in this 19th century be the site of explorations which are creating so much interest. On examining the sandstone hill on the west bank of the Nile, the removal of the sand led to the discovery, in 1885-6, of a series of tombs where the nobles and chiefs of ancient Syene had been buried, containing inscriptions which indicate that the hill had been used as a cemetery as far back as 3000 B.C. From these inscriptions much interesting information is to be gathered of the manners and customs prevailing at the remote period to which they allude, some of them being of great historical interest. The freshness of the paintings on some of the shrines is surprising, and the colours are wonderfully true to nature. The hieroglyphs for granite hills are good representations of granite, and that of an elephant is painted in a greyish sepia the exact colour of the animal. Of the granites used in this country for building purposes, the most important are those obtained from Devonshire and Cornwall, and the Scotch granites. The Scotch granites are too well known to require any lengthened description. We find examples of the grey granite of Aberdeenshire in nearly every cemetery, and columns of the celebrated red granite of Peterhead adorn the public buildings of almost every town of importance. The Cornish and Devonshire granites are of a more porphyritic character than the Scotch granites, the crystals being of a larger size. As regards their relative durability, they are both of them, when properly selected, of so permanent a character as to allow of the selection of either the one or the other for any engineering work being made upon other considerations than their relative liability to decay. The Devon and Cornish granites possess one advantage, inasmuch as blocks of a much larger size can be obtained of these granites than from the Scotch quarries. Granite obtained near the surface, and near the edges of the formation, is not unfrequently defective owing to imperfect crystallisation, and the use of such granite is considered to have been the cause of the unsatisfactory condition of some of the Cornish granite used in the erection of Waterloo Bridge, which has sometimes been referred to as a proof of the inferiority of the Cornish granite to the Aberdeen granite, although Cornish granite from the same district has been found to be perfectly satisfactory when used for the Thames Embankment and elsewhere. The Shap Fell granite of Cumberland is porphyritic in its character, and is easily recognised by the large crystals of red felspar which are too conspicuous to escape being noticed. There are two varieties of this granite, the dark and the light coloured. The dark variety has of late years been largely employed in many parts of London, and of this we have a good example in the posts at the western entrance of St. Paul's Cathedral. The so-called Leicestershire granites form a remarkable and very interesting series of crystalline rocks which are quarried within a radius of about twelve miles from the town of Leicester, known as the Charnwood Forest range. Of these, the Mountsorrel, is a syenite or hornblendic granite, of which there are two varieties, a grey and a red, the grey blocks being sometimes coloured red at their edges, from which it would appear that the colouring matter (consisting mainly of iron oxide) has been absorbed through the joints of the rock. Blocks are obtained of a sufficiently large size for building purposes; but it is more extensively used for paving setts and road metal. The rock is traversed by a basaltic dyke, running right through the hill, known locally as "blue stone," which is used for road metal only. The Groby and Markfield quarries are very much alike as regards the material they yield, but it is of a still more syenitic character than that obtained from Mountsorrel, and would formerly have come under the designation of syenite; it is largely used for kerbs, paving setts, and road metal. The Stoney Stanton quarries yield a material similar to that obtained from Groby and Markfield in its composition; but differing in structure, which is used for the same purposes. That obtained from the Barden Hill and Charnwood Sheepshed quarries partakes more of the character of greenstone. The Barden Hill has somewhat of a slaty cleavage, and as it will not break into cubes, can only be used for road metal. The granite yielded by the Sheepshed quarries possesses the highest specific gravity of the series; it can be made into paving setts, and is also used for road metal. The excellence of the Leicestershire granites, as well as those of Guernsey, for the purpose of making paving setts, or for road metal, does not depend so much upon their specific gravity or hardness, or upon the amount of resistance they offer to a crushing force, as upon their peculiar toughness, which is probably derived from the manner in which the crystals composing them are interlocked with each other. In the paving of the quadrangle of the India and Colonial Offices, both the red and the grey varieties of Mountsorrel granite have been employed. Granite is imported from Norway which finds a ready demand for kerb stones, for which it is particularly adapted on account of the length of the blocks in which it is supplied. Some of the indurated sandstones that have been converted by pressure and infiltration of silica into quartzite form an excellent material for road metal, of which we have an example in that quarried at Pontesbury, near Shrewsbury. Amongst granitic or metamorphic rocks may be classed that very beautiful material for decorative purposes known as serpentine. Varieties of this rock are found in various parts of the world, in the mountains of the Alps and the Vosges, at Portsoy in Scotland, where it is known as Portsoy marble, and in West Galway, where it is termed Connemara marble. The term marble is restricted by geologists to limestones which are capable of taking a fine polish; but the term is still employed (in what very probably was its original meaning, since the name is derived from the Greek word μάρμαρος, signifying gleaming or sparkling) to designate any kind of stone, irrespective of its composition, that is capable of being polished. In no part of the world is serpentine seen to greater advantage than in Cornwall, where it forms a large portion of the promontory of the Lizard; much of the beauty of the celebrated Kynance Cove being due to the variegated colours of the serpentine rocks by which it is surrounded. The value of serpentine depends upon the variety and beauty of the colours it displays, and on the fact that, although it is capable of being easily polished, it is a comparatively soft rock, and can be readily cut or turned in a lathe. It is a hydrated silicate of magnesia, and is liable to deterioration by exposure to the weather in this climate; it is, consequently, employed chiefly for interior decorative work.

ARCHITECTURAL ASSOCIATION EXCURSION, 1887, WILTS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

ON Monday next, as announced in last Friday's BUILDING NEWS, the annual excursion of the Architectural Association will commence. To-day we begin our series of illustrations of places to be visited. Canon J. E. Jackson has written the following account of the Monastic Church of Edington, one of the principal churches which will be seen, and which is here shown by a plan to scale and western façade.

Few buildings in the county of Wilts are more deserving of being examined, whilst there is perhaps none so little known to the public in general, as this fine old church. Large churches are usually conspicuous enough; that of Edington does not proclaim itself, but has to be sought out. It stands about two miles east of the figure of the White Horse on the slope of Westbury Down.

Mr. Charles E. Ponting, architect and diocesan surveyor, is now "restoring" the building, not according to the scraping practice which often means changing every feature, but simply in making certain repairs that are absolutely essential to preserve it from ruin. Externally there is not much appearance of decay, the masonry being, upon the whole, in sound condition; but there are some very serious exceptions. Insidious mischief has been going on for so many years in the roof and walls, and their fall in some parts would have been certain unless timely steps had been taken.

Edington is the only perfect monastic church remaining in the county of Wilts. Of the rest, as Malmesbury, Wilton, Lacock, Bradenstoke, &c., we have one or two noble fragments, but fragments only, and in some cases not a stone

is left. At Edington, though the monastery itself and the cloister adjoining the church have disappeared, the church stands, in the main, as complete as when first built.

It occupies a unique position in English architecture, being (as described by the late Mr. J. H. Parker) "the earliest authenticated example of the Transition from the Decorated to the Perpendicular style. Its date being known fixes the period of the Transition," and it is of undoubted beauty and interest.

The whole church appears to have been built at the cost of one man. No mention at least of any coadjutors has been met with, though endowments for maintenance soon came in from other quarters. This man was William of Edington, a native of the place, who is commonly said to have been the son of very humble parents, but who raised himself by his abilities to the high dignities of Bishop of Winchester, Lord Treasurer, and Chancellor of England in the reign of King Edward III. He was also nominated Archbishop of Canterbury; but this was in the last year of his life, and he declined it, probably on account of infirmity.

The history of the foundation is briefly this:—

The manor and rectory of Edington belonged by an ancient royal gift to the Abbey of Romsey in Hampshire.* The rector was a prebendary of Romsey, resident there. Edington Church (the predecessor of the present one) was called a prebendal church, and a vicar was left in charge there. Soon after his appointment (A.D. 1345) to the see of Winchester, Bishop William, bent on improving the state of affairs in his native parish, arranged with the abbess of Romsey for the establishment of a collegiate body of three, and never to be more than six, secular priests under a warden. But very soon afterwards, at the special request of the Black Prince on his return from the war in France, he enlarged his design and converted his secular into a monastic society of Bonhommes (*Boni Homines*), a variety of the Augustine Order, of which there was in England at that time only one house, at Ashridge in Buckinghamshire. The first stone of the monastery was laid 3rd July, 1352; and the church was consecrated in 1361. It was dedicated to the Blessed Virgin Mary, St. Katharine, and All Saints. The founder died in 1366. His chantry and effigy are depicted in Britton's "Winchester Cathedral." It was Bishop William who began in Winchester Cathedral the alterations into the Perpendicular style, which were carried on by his successor, William of Wykeham. The west window there is attributed to Bishop Edington; but it is more stiff and much less imposing than the west front of the Wiltshire Church. At the Dissolution of Monasteries, this house, with all its property, was granted to Thomas Seymour, of Sudeley (brother to Protector Somerset), and on his execution to William Paulet, first Marquis of Winchester, whose descendants became Dukes of Bolton, by some one of whom the present priory house was built out of the ruins of the monastery.

The main dimensions of the church are as follows:—Total lenth inside, 153ft. 9in.; total length outside, 168ft. 6in.; total width inside, 71ft. 6in.; total width outside, 86ft. 10in.; height of tower from the nave floor at west end, 67ft. 6in; the chancel by itself, 54ft. long. The plan is cruciform. The rood-screen is still surmounted by the rood-loft. The parvise over the porch has two stories. The windows were once fitted in stained glass, and in one in the north transept the original glazing is nearly complete. In others are remains of beautiful figure-subjects.

There are some interesting monuments which would be ruined if the roof should fall in. Between two columns in the nave is a small oratory or chantry of about A.D. 1440, to one of the Cheney family of Brook House, near Westbury, which shows some delicate stonework. At the end of the north transept is a beautiful 15th century altar-tomb, with canopy and effigy of some benefactor, probably a Bayntun, a *rebus* carved on it being a *Tun*, out of which issues a spig of (perhaps) bay. The initials are I. B. In the chancel is a large 17th-century monument to Sir Edward Lewys, some time a lessee of Edington under the Paulets. Against the north wall is a beautiful group by Sir Francis Chantrey, representing the death-bed of Sir Simon R. B. Taylor, who died in 1815.

This grand old church has lately been thoroughly examined by Mr. C. E. Ponting, the diocesan surveyor. There could not be a more distressing report of destructive agency at work. Settlements are imperilling the fine west front and other portions. Imperfect drainage by gutters has long been letting water into the solid walls and loosening the masonry. The roof timbers are, in places, on the point of giving way. It is difficult to describe in few words the mischief that has unfortunately been allowed to go on for a great many years without any effective attempt to counteract the injuries of time. "It is always (says the architect in his report) a great misfortune that an object of such value should need the services of a repairer; but that need is so urgent in the present instance, that if nothing be done, parts of this exquisite architectural design will shortly be lost, and we of the present generation, who pride ourselves in the possession of such a relic of bygone ages, will be guilty of neglect of the plain duty imposed upon us of preserving and handling it over unimpaired to our successors. The structure has, in fact, gone beyond the stage at which it may be let alone with impunity."

According to Mr. Ponting's estimate, £2,077 is stated to be the cost of the structural repairs of the building, so that, including other necessary expenses, not less than £3,000 will be required to complete the work. The plan of the church, printed herewith, is from the architect's drawings. The view of the west front is from a photograph.

Our other illustrations are from South Wraxhall Manor, showing an interior of the celebrated and beautiful drawing-room; and a view of the ancient bridge at Bradford-on-Avon with its picturesque and stone-built "mass house," as the chapel is called, standing on the central pier over the stream. These sketches are from photographs taken by Mr. R. Wilkinson, of Trowbridge. We shall give further drawings of South Wraxhall Manor House with plans, and will then incorporate in our description of the excursion some particulars of the building. Mr. Charles E. Ponting has lately been repairing the fabric, but has added nothing to the house; his operations being confined to some important structural renovations, such as the insertion in the drawing-room of a new girder over the Elizabethan bay on the north side of the apartment. Here the lintel carrying the 15th-century roof had become rotted off at the ends, so that both the roof and rich plaster ceiling, seen in our view, were in danger of collapse. To render this safe without touching the ceiling the architect put in a rolled joist through the roof and laid it over the lintel, bolting the two together. Among other things Mr. Ponting removed the paint from the oak panelling in parts of the house with much effect. The remodelling of the drawing-room at the end of Elizabeth's reign is a most ingenious and interesting piece of work. The house belongs to Mr. W. H. Long, M.P. The buildings will be described by Mr. J. A. Gotch, when they are visited on Wednesday.

* Fuller accounts of Edington Church are to be found in the *Journal* of the British Archæological Association, Vol. XXXVII. p. 72; and in a paper by Rev. Canon J. E. Jackson, in *Wilts Archæological Magazine*, Vol. XX. p. 241. Mr. J. H. Parker has shown the west front in his "Introduction to Gothic Architecture," and double-page drawings of the exterior by the late F. C. Deshon are given in the BUILDING NEWS for July 12th, 1872.

MILAN CATHEDRAL COMPETITION.

THE following is a *résumé* of a rather lengthy report of the jurors appointed to select and report on the designs submitted in the recent competition for new façade of the Duomo of Milan. The competition in its various stages affords an apt illustration of the proverbial length of art and brevity of life. The first stage has occupied sixteen months; fourteen more are allotted to the second; and the successful party has to make or supervise a model of the entire new façade to a scale of about ¾in. to the foot:

"More than 120 competitors submit collectively 400 designs. It is not merely this unusual number, but the unsparing endeavours made by these artists, that render this almost the most remarkable and varied competition ever opened to international art.

"The subject presents considerable difficulties. We have here a most renowned monument, in which the spirit of local art feels strongly the influence of a foreign style. The edifice is absolutely unique in character, and in the abundance and variety of its details and parts, rendering careful discrimination needful among its varied features to derive an inspiration for its improvement and completion from so many other coeval or anterior similar works. Notwithstanding this, the sincere love for the consummation of the pride of Milan has inspired so many able artists—Italian, German, French, English, &c.—to undertake this formidable task. Many more than the fifteen would come well out of the contest if the limited selection made for the final trial could be augmented.

"Criticism and selection in this case were rendered the more easy, and judgment arrived at with unusual promptness, owing to the good feeling and unanimity influencing the jurors. Artists from so many divers countries, all of whom, equally with the Milanese, bring to the task their predilections and experiences of their various arts of painting, sculpture, and architecture, their decisions were made almost unanimously and most harmoniously.

"After ample examination, 50 designs were chosen, subsequently reduced to 26, and finally to 15, the last selection being made by ballot, the jury also arranging the conditions for the second or final competition.

"The selection was difficult, for the following reasons:—In the instructions of first programme, 'The utmost liberty is accorded to artists in artistic or archæological treatment,' qualified by the following second condition:—'That the new work must in all respects closely agree with the construction, style, and spirit of the existing work.'

"This agreement must depend upon the good sense that is justly allowed to regulate a circumscribed freedom; it is quite a relative condition.

"The jury should not examine in too niggardly a manner the 'motifs'; they deemed it best to examine one by one the designs, to judge if the principles were logically and artistically applied.

"They were not treating a work as if it were about to be carried out; but rather opening out the field again to those competitors who, with their designs, masters of their art, give proof of their capacity in a fresh and arduous labour to devise in a dignified way the new façade of the Duomo.

"From this liberal interpretation of the instructions it results that a great diversity is shown in the selected designs—façades with and without campaniles, with two gables only, with gables over each aisle, with parapets horizontal or gabled, with two campaniles to central nave or two to the side aisles, with acutely-pointed towers or flat ditto, traceried windows over centre door or rose windows ditto, five doors or three, &c.—a greatly and admirably varied result, and a good augury for the final result, in the different and opposing ideas of the competitors.

[Here follow the names and nationalities of the fifteen selected competitors, already published. Two of the architects submit each *two* designs, another submits *three*, and another *five!*]

"Of the 15, 8 are Italian, 2 German, 2 Austrian, 1 English, 1 French, and 1 Russian—a fine and noble co-operation of art in a monumental work, attesting the courtesy and good faith of an ancient Italian community, which invoked five centuries ago, as it does now with more effect, the aid of foreign art.

"Having completed their first function, the jury address themselves to the second—viz., the compilation of the new programme within the lines of which the fifteen competitors should conduct their work.

"Should the jury, after ransacking the history of the Duomo from all sources and studying its varied architecture, impose any definite arrangement or conditions?

"The jury would, in doing so, have contrived in a great part the design itself, and done it under the most unfavourable conditions—that is, with the criticisms and agreements of their collective labours. If there ever was a work of art that recorded the individual genius of its designers, it is assuredly the architecture of our Duomo. The true artist invents, contrives and designs, and solves the various difficult problems of his art by the light of his own inventive genius. To presume to diffuse among

fourteen or fifteen persons with the sole aid of reasoning the complex questions herein presented would be an absurdity. Each of the jury has doubtless a deep persuasion of what he would do as an artist individually; but, as judges, they feel it but just to leave to their colleagues, and also to the competitors, their own convictions.

"On the other hand, the true impartial critic has not said the last word as to the history or architecture of the Duomo. He may see in it the germs of entirely Italian art, or may recognise an origin entirely ultramontane; but no one can deny a co-operation more or less effective of diverse arts. Now, however, the conceptions of so many varied arts may in great measure accommodate themselves to produce a harmonious whole, provided that in transformation they seize the appropriate features of the old structure.

"It results that this competition is now restricted to architects, masters of their several schools, to those who, either resident in this city, or feeling it due to visit it with the view of studying its Duomo in every aspect—structural, artistic, or archæological. The jury are unanimous in following the freestone course, merely contenting themselves with the recommendation that the new façade shall have the most intimate connection with the constructive execution and architectural form of the original building, and with the decorative style of the same in its most ancient state.

"They are also unanimous in their requirements as to the delineation and graphic representation of the final designs. The jury deprecate the picturesque mania evidenced even in some of the best of the submitted designs; some conceal the forms of surfaces under a mass of chiaroscuro and colour; others invoke a manner quite independent of architectural appearance, not with a view of showing the projections and recesses of the features, but simply with a view to picturesque effects. The jury admit the principle of shading, but restrict it to the simple indication of relief and recession of the parts, 'excluding absolutely all pictorial effect.' The details to be drawn to a scale of 1-20th, merely in outline; the general elevation of façade to 1-50th (i.e., about ¼in. scale); the plans and sections to 1-100th; and, finally, a perspective view from a point and angle of view comprising the whole of the Duomo and part of the arcade of the Galleria V. Emanuel in the surrounding square.

"The jury confirm the conditions of the original programme in imposing no limitation whatever to the cost of work, as also the undertaking of the administrators to pay the agreed premiums to the 15 competitors—that is, 40,000 francs to the first competitor, and an equal amount in varied sums to the remaining 14. They assign fourteen months for the preparation and sending in designs, and, finally, they merely allude to a point perhaps as important as any, which they do not absolutely decide—viz., the right to send in more than one design apiece. They desire to lay down no specific law as to this, merely beyond the expression of a wish to avoid the excitement involved in the multiplication and examination of so many varied schemes, and specially desire that the artists should concentrate their proper talents and attention on one unique design, which they should study and consider in all its various bearings," &c.

ST. MARY-LE-STRAND.

EVERYONE who has walked through the Strand from the West must have noticed an imposing and narrow Classical structure with a lofty steeple near Somerset House, known as the Church of St. Mary-le-Strand, which has been surrounded by a hoarding, and is about to undergo repairs. Few have probably ever entered the church, or are aware that it is the first built of the fifty churches re-erected in Queen Anne's reign, after the Great Fire. It is generally supposed that it is one of Wren's churches, but it is not so, it having been designed by James Gibbs, a Scotchman, whose ability and taste as a Classical architect are well known. The church was erected in 1717, and consecrated in 1723. The site of this church is not without interest. It is said to stand on the site of St. Ursula, a very ancient church, and nearly upon that of the old Maypole. The existing edifice, in its west front, is distinguished for a lofty steeple of three stories, each of the two lower stories being set within the other in one direction, the set-offs being marked by two detached Corinthian columns, which form the flank elevation of the steeple. This steeple is not carried down, but appears to start from the roof, the western face being on the same plane as the façade. Viewed from the western end of the Strand, the steeple is a decidedly picturesque object, and the façade a stately elevation, the central portion below the tower being marked by a pediment supported by coupled columns of the Corinthian order above, and a semi-circular Ionic portico below, which is noted for its beauty, and has often been taken as an example of Classic detail. The body of the edifice, which is rectangular, is of two orders, Ionic below and Composite above; three alternate bays are pronounced by pediments, triangular and circular, and the other portions are surmounted by a balustrade and urns. The cornices and external stonework appear to have given some trouble. Timbs says that during the procession to proclaim peace in 1802 one of these urns was accidentally pushed down on the crowd below, and three persons were killed and several others hurt. A few years since, during some repairs, all the vases were removed from the several stages of the steeple, greatly to the injury of the skylines. Quite recently the church has been declared to be a dangerous structure by the Metropolitan Board. In 1883 the columns of the circular porch were found to be unsafe, and were restored under the superintendence of Mr. A. Vicars, the architect, who has been engaged in making a thorough examination of the fabric by the orders of the vestry. At a meeting of the vestry, held last week under the presidency of the vicar, the Rev. Canon Tugwell, to consider the notice received from the Metropolitan Board of Works, a report from the architect was read, in which that gentleman stated that a large piece of the cornice on the north side had fallen into the street about 9 o'clock in the evening of the 23rd of July. He also stated that the cause of the fracture of the stone columns of the portico was the decay of the joints, which admitted air to the iron dowels, causing them to oxidise and burst the stone. A similar reason was assigned to be the cause of the cornice breaking away: the iron cramps had become oxidised and had burst the stone; and Mr. Vicars pointed out that the process of oxidation was going on and might cause any portion of the projecting work to fall. The stonework of the parapet and cornices had much decayed, and the vases were unsafe and required immediate attention. Mr. Vicars, in his report, has recommended a thorough overhauling of the building, that a mason be employed to sound the whole of the exterior projecting work with a hammer, and to remove all unsound or defective stonework except the upper part of the spire. As the work was considered one for public safety, immediate steps were taken, and the church has since been surrounded with a hoarding. The district surveyor, Mr. F. W. Porter, had advised that the lower and defective portions of the stonework should be taken down, and that a scaffold be erected to examine the stonework generally. He gave a month for the work to be carried out. The work has already been commenced, the defective and loose stonework and vases are being taken down, and the examination of the fabric by the architect will be proceeded with. The chief danger resides in the projecting cornices and urns, and these are to be removed forthwith. The fall of a fractured stone from the cornice has awakened the authorities to the probable condition of other parts of the cornices and projecting stonework; but the accident ought to stir other custodians of churches in the City to take steps to place their buildings in a safe condition. The iron dowels and cramps used in many of the old stone churches are a perpetual source of danger, and there are few of the old City churches that do not show decayed cornices, balustrades, and weakly-poised vases in the parapets of the steeples. No one can tell what the solvent action of rain or the force of a gale may not do.

We should be sorry to see the removal of the Church of St. Mary-le-Strand, obstacle though it may be called in a busy part of the Strand; but we fear the casualties of falling stonework will lend a favourable excuse to those who have been advocating its demolition. The vestry, we are told, would offer no objection to the removal of the church, and the Metropolitan Board of Works have before them several suggestions for widening the Strand at this point, either by the removal of the south side of Holywell-street or by taking down the church. In the House of Commons on Monday, Mr. Egerton, in reply to Mr. Kimber, referred to the accident of the falling stone from cornice, and said the Board of Works had declared the church to be a dangerous structure. One thing had deterred a step being taken which archæologists and many architects and others would regret; this was the cost of pulling down and re-erection in some other part of the parish, which was estimated at £10,000. One of the schemes that had been proposed was that the Holywell-street block should be pulled down, and the site or space between St. Mary's and St. Clement Dane's inclosed and laid out as a garden or pavement. Another was to remove the church and Holywell-street block altogether; and a third plan was to take down and set back the houses on the north side of the church, so as to divide the traffic.—The interior of St. Mary-le-Strand is worth notice as a very florid example. Like the exterior, it is divided by two orders of pilasters, Corinthian below and Composite above, with panels between the lower pilasters and windows above; the former need filling by appropriate figure subjects. A very flat elliptical ceiling, with panels of square and diamond form, divided by ribs, and of lavish projection and ornament, spans the interior. At the east end is a semi-circular apse, with the symbol of the Trinity glorified with cherubim, boldly modelled in plaster in the panels of semi-dome—a very rich and effective design, with three painted glass windows, by Messrs. Heaton, Butler, and Bayne, representing the Birth, Presentation, and Crucifixion of the Saviour, above which are pedimented panels richly carved. The front of chancel arch consists of two orders and pediment, massively carved in stone, and enriched by colour and gilding. The ceiling is battened and pricked up *in situ*, and is certainly a fine example of decorative plasterwork. The panels are of light blue, with the ribs in white and gold, and a generally pleasing scheme of colour is adopted. A richly-carved pulpit, oak panelling, and seating are features. The work of repair and decoration is being carried out by Mr. T. Heath, of South Eaton-place.

THE FIRE AT WHITELEY'S.

THE terrible fire at Whiteley's affords some useful lessons with regard to fireproof construction, and the ruins are worth examination by architects for the sake of the contrast they afford between the results obtained from a well-tried method like the Dennett system and the ordinary builder's "fireproof" construction.

The work executed by Messrs. Dennett and Ingle on Mr. Whiteley's premises was done in the latter part of 1880. It consisted of the concrete arching of No. 159, Queen's-road, the premises at the corner of Queen's-road and Douglas-place, the floor of loading-shed in Douglas-place, the floors of two external courts between Nos. 159 and 157 and between 157 and 155 respectively, and sundry other floors near the stables, and lying westward and southward of the premises first-named. Generally speaking, the work is situated in those parts of the premises where the fire raged the most fiercely.

The results, so far as the fireproof qualities and strength of the "Dennett arching" are in question, are without doubt most satisfactory. The large block, No. 159, Queen's-road (provision department), is about 160ft. long and 35ft. wide; the whole of the ground floor is constructed with "Dennett arching." This building, except the basement story, is entirely burnt out, the upper floors not being of fireproof construction.

The ground floor is covered many feet deep with *débris* resulting from the destruction of the superstructure. The "Dennett" floor, however, is intact, and, so far as can be ascertained in the present dangerous condition of the building, not injured in any way by the severe ordeal to which it has been subjected by fire and falling weights. The storage in the basement under this floor has been damaged, but

the fire has evidently found access through the basement windows, lift-holes, and other openings. The floor itself is intact. The same remarks also apply to the loading-shed lying further westward in Douglas-place.

The internal court between Nos. 159 and 157 was formed with Dennett arching. In this case the flank walls of the adjacent warehouses have fallen bodily, and for the most part this area floor has been carried with them, the immense weight of falling brickwork having cut or sheared away to the depth of several feet the brickwork on which the girders supporting the arching took their bearing. The arching itself does not appear to have succumbed either to fire or falling weights. The same remarks apply to a small portion of the van-yard at western end of last-named area. The greater part of this floor is intact. This is close to the shop where the fire broke out.

The portion of the floor now standing is covered with *débris* of brickwork and fallen floors, roofs, &c. The immense strain to which it must have been subjected, without giving way, by the masses of br ckwork falling from a great height, is very remarkable. In the case where the floor is broken the girder ends seem to have sheared through their seatings, tearing away the brickwork as described in the case of the court between Nos. 159 and 157.

The most extraordinary instance, however, is that of a floor 70ft. long lying westward and southward of the van-yard last named. This is also constructed with Dennett's arching over the basement. It is covered by debris, and large masses of brickwork have fallen upon it. In one case a piece of unbroken brickwork is visible (and which must have fallen from a height of 30 or 40ft.) weighing at least three or four tons. The floor construction is still standing, and, so far as can at present be ascertained, is uninjured. A fireproof floor of a construction other than Dennett and Ingle's over the last named is entirely destroyed.

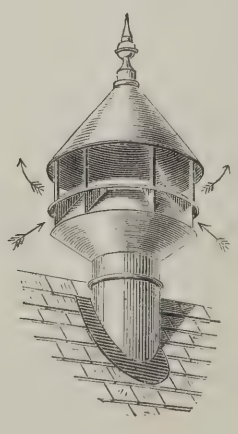
The fireproof floors and roofs of the large blocks of shops in Queen's-road, constructed subsequently to the year 1880, and by methods other than those of Dennett and Ingle, and which were the most severely attacked by the fire of the 6th inst., have in many cases collapsed.

HOT-WATER SUPPLY.*

A PRACTICAL treatise on the fitting of hot-water apparatus is what was wanted by architects and others engaged in heating buildings. Mr. F. Dye has to some extent supplied the want of a simple yet technical handbook, and has given the result of his experience. Boilers, cylinders, and tanks, pipes, circulation, different systems, directions for placing the pipes, testing, safety-valves, coils, and coil services are dealt with, the author explaining the best materials and forms of boiler and cylinder, the arrangement of the pipes, jointing, heads, and other details. The book, however, lacks system in the arrangement of the chapters. The student would like to know something about the theory of circulation in pipes before he troubled himself with the shape and thickness of boilers, which subject forms the opening chapter. If we were to suggest, we should say the remarks on the results noted in the chapter on experimental glass apparatus, and circulation, ought to precede rather than follow the remarks on cylinders, tanks, pipes, and apparatus. In preparing specifications and estimates, Mr. Dye's book will be of service. In the chapter on boilers useful information is given respecting the thickness of plate, which varies from ¼in. to ½in. A ⅜in. plate is sufficient for most purposes. The shapes and proportions of boilers, and those of copper, are treated, and useful particulars of the pressure to which they are subjected are to be found. The pressure of water in pipes is 11b. to every 2ft. 4in. in height, in a pipe with an internal area of one square inch. Of the quality of pipe, that known as "steam tube" or "galvanised steam" is recommended, though a number of firms use gas-pipe. For the flow and return pipes 1¼in. internal diameter is suitable; 1in. pipes for the service above cylinder or tank, and for branch draw-off services ¾in.; to lavatory basins ½in., and cold supply 1in. For baths 1in. service is necessary. Special directions are given as to the method of jointing up iron pipes. The screwed part is painted with a mixture of red and white lead and boiled oil, and hemp is wound round in the thread of screw carefully. Lead pipes are sometimes used in the North, but are, of course, condemned. Attention is drawn to properly hooking or securing the pipes to prevent sagging, especially vertical pipes. The author illustrates both the high or tank system and the cylinder system. In the first the flow and return services are carried between boiler and tank; in the latter there is a cylinder placed near to the boiler with a flow and return between. From the top of cylinder the rising main is taken to above the level of cold water. Draw-off services are taken from this pipe called the secondary flow. The author points out improved methods of connection, the position of pipes, which ought to be carried up inner walls to economise heat and the avoidance of encasing and covering up pipes in plaster. Other remarks are made as to explosions and their causes, safety valves, the fitting up of coils, and many common faults are pointed out. The author is thoroughly practical, and the remarks are illustrated by diagrams.

* Hot-Water Supply. By F. Dye. E. and F. N. Spon, 125, Strand.

BOYLE'S "C. C." VENTILATOR.



THIS ventilator is an adaptation of the well-known cowl made by Messrs. Robert Boyle and Son, Limited, which is a modification

No. 1.

of the Self-acting Air Pump Ventilator. The "C.C." Ventilator is designed to be applied to buildings where cost is often the first consideration, and though it is not pretended that it is

No. 2.

such a powerful exhaust as the latest improved form of the air-pump ventilator (1882 patent), it is confidently recommended as an efficient and reliable ventilator, specially useful for such buildings as steam laundries, engine-rooms, workshops, cowhouses, stables, &c.; it has also been applied with good results to schools and meeting houses. Diagram No. 1 shows the design most suitable for this class of building, whilst diagram No. 2 is the form usually employed for workshops, &c. The cost brings it within the reach of all, being from 8s. 6d. upwards.

CHIPS.

The death is announced of Dr. Andrew Fergus, of Glasgow, at the age of 65, well known as a scientist and sanitarian. His investigations into the action of sewer gases on water supplies have attracted much attention, and also his demonstrations of the actions of these gases on leaden pipes. Dr. Fergus served for three years as president of the Glasgow Philosophical Society, and for the past ten years had represented the Crown as representative for Scotland on the General Medical Council.

It is stated that M. Veresclagin, the well-known Russian historical painter, has taken the Grosvenor Gallery for an exhibition of his works during the coming winter.

Mr. Thomas Brock, A.R.A., is the sculptor of the statue of the Queen to be erected at Worcester. The statue will be of white marble, 10ft. in height, and will stand on a granite pedestal 12ft. high already erected opposite the Shire-hall.

An inquest was held on Friday on the body of a woman who was killed by the fall of a warehouse wall in Toronto-street, Kirkdale, near Liverpool, destroyed by fire on the previous Tuesday. The jury, in returning a verdict of "Accidental death," considered that some blame attached to the district building surveyor in not taking more immediate means for the removal of the wall or the security of it than directing the owners "to pull it down or secure it within 48 hours."

New Sunday-schools are in course of erection at Florence, near Longton, Staffs, in connection with St. Luke's Church. They are built of brick, and will accommodate 250 children. Mr. C. Lynam, of Stoke-on-Trent, is the architect, and Messrs. H. and R. Inskip, of Longton, are the contractors.

The tower of St. Martin's Church, Coney-street, York, is undergoing restoration. Mr. Keswick, of that city, is the builder.

Viscount Portman, now in his 89th year, laid last week the foundation-stone of a mansion at Childe Okeford, now in course of erection for his grandson, Mr. Claud B. Portman. Preparations for the ceremony were made under the supervision of Mr. Hunt, of London, the architect, and Mr. Green, of Blandford, the builder. The foundations of the mansion are completed. The building will be of brick, with Bath-stone dressings, iron girders being used as supports for the floorings.

The new south transept window at Chester Cathedral, which has been reconstructed at a cost of over £3,000 (the gift of Lord Egerton of Tatton), was dedicated on Saturday afternoon. The old window, which was a very plain one of the Perpendicular style, has been replaced by a richly-traceried window, designed by Mr. A. W. Blomfield, the cathedral arehitect. The subjects of the three central panels are the Ascension, the Crucifixion, and the Annunciation. The artists are Messrs. Heaton, Butler, and Bayne. There are 16 subsidiary subjects from the Scriptures occupying the side panels. There is a good deal of silvery white in the composition associated with various shades of green and yellow. The window is in memory of the late Lord Egerton.

Damage to the extent of £1,200 was caused by fire on Friday at the works of Mr. Peter McCormack, glass stainer, Hilltown, Dundee.

The Bodleian Library purchased at a sale at Messrs. Sotheby's last week, a small volume which has since been identified as the Evangelistarium, or portions of the Gospels recited during the Mass, which belonged to St. Margaret, Queen of Scotland (ob. A.D. 1093), the granddaughter of Edmund Ironsides and mother of Matilda, the wife of Henry I., and the foundress of Dunfermline Abbey. It is beautifully illuminated with four full-page pictures of the Evangelists, in the English style of the first part of the 11th century. The MS. was subsequently in the possession of Lord William Howard, of Naworth, who gave it its present binding.

The city council of Salisbury have appointed Mr. G. Cary inspector of nuisances in succession to Mr. J. White resigned.

The Worshipful Company of Carpenters will hold a second exhibition of works in wood at their hall, London Wall, London, in the early part of next year. Full particulars as to time and conditions will be advertised as early as possible in October.

STAIRCASE, GOSFORD HOUSE.—POOLE FREE LIBRARY.—SCULPTURE FROM THE ROYAL ACADEMY.—ART METAL WORK.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES, 1887.

OUR LITHOGRAPHIC ILLUSTRATIONS.

STAIRCASE, GOSFORD HOUSE.

THIS staircase is now in course of erection. Mr. William Young is the architect. The materials are veined marble, alabaster, and stone. The drawing was exhibited at the Royal Academy exhibition.

POOLE FREE LIBRARY.

IN giving a description of this building, of which this week we furnish an illustration, it might be well to say, first, that the main entrance is approached by ascending a few steps from the level of the footpath, and passing under an arch which leads to the porch or open vestibule. A framed wood screen fitted with leaded lights divides this space from the main hall, which is oblong in form and measuring about 26ft. long by 13ft. wide. At the farther end of this apartment to the left rises the public staircase, and on each side are ranged the doors leading to the several rooms on the ground floor, the lavatories, &c., being arranged at the back, partly under the stairs, and entered by different channels. The general reading-room on the right is the principal feature in the building, and measures 44ft. long by 24ft. wide and 15ft. high, with a coved wood ceiling springing from a wood cornice, 11ft. from floor, and divided into panels of appropriate character by moulded beams and ribs; Wenham burners depending from the centre of the three principal panels, and surrounded by a large fret centre flowers for top ventilation. This room has a south and west aspect, and is lighted with lofty mullioned windows, and of such proportions that a row of tables may be placed on each side with ample space in the centre for access to any part. It is heated, like the rest of the building, with hot-water coils, supplemented by open fires, the whole of the fireplace and chimneypieces being formed in local tiles, moulded, embossed, and plain, according to their position or purpose, supplied by Messrs. Carter and Co., of the Poole Pottery. The ladies' reading-room, being entered on the left of the hall, and similarly appointed, measures 32ft. by 20ft., but ends in an octagon bay, with windows of the same character overlooking the main street, and is provided with a small gallery in a recess on one side for additional accommodation in the event of the room being used for any other purpose than that for which it is mainly intended. The library proper consists of a room of 27ft. by 16ft., and the same height as the others, fitted with shelves, forming bays on one side, with a gallery over and shelves over this again up to the ceiling. Ascending the staircase, the caretaker's room is entered from the half-landing, forming a mezzanine floor, with windows overlooking the staircase, hall, and different openings. Reaching the first floor the reference library is entered on the left, and is of the same dimensions as the lending library below it. The School of Art is also situated on this floor, and consists of two large rooms immediately over the two reading-rooms just described below; the larger of the two, for male students, being ceiled in panels, with the principals showing half-way up the roof to admit of as much top-light as possible, and both being provided with separate lavatory accommodation. A third room is also provided over the hall, with an oriel window, for the use of committees or other business connected with the institution. A second and smaller staircase from this floor leads to the librarian's domestic apartments, consisting of kitchen and scullery, living-room, two bedrooms, and offices. A third attic staircase leads to the observatory turret over the octagonal roof at the north end of the building, and commands extensive and beautiful views of Poole Harbour. The style of architecture adopted may be classed as Queen Anne, suggested in the first instance by most of the best buildings in the town being contemporaneous with this reign, and also by its general adaptability to brick treatment with stone dressings—the materials most readily at hand. The foregoing is an outline of the general features of the building; but as the entire cost, with the exception of the fittings, has been generously borne by one private individual, no description, although chiefly for technical information, would appear fair and complete without mentioning the name of Mr. J. J. Norton as the donor of this important addition to the opportunities for instruction in the town of Poole; the expense of the library and fittings being all that is left to be subscribed for by the public. It only remains now, therefore, to add that the building has been erected from the drawings and under the entire superintendence of the architects, Messrs. Lawson and Donkin, of Bournemouth; Mr. J. W. Mannell, of the same town, having executed the stonework; Mr. Bacon, of Poole, having supplied, as well as defrayed the cost of, the hot-water fittings; as Mr. Bailey, in a similar way, the gas. The whole building has been completed in little over four months from the time of commencement, and will be ready for opening by the end of this month.

SCULPTURE FROM THE ROYAL ACADEMY EXHIBITION, 1887.

THE most important piece of statuary shown on this sheet of drawings from this year's Royal Academy Exhibition is that of General Gordon, to be erected by Mr. Hamo Thornycroft, A.R.A, in Trafalgar-square, as a national memorial to the great soldier. The monument is a truly dignified design, and in so able a sculptor's hands may safely be looked for as an unquestionable addition to the statues of London. The marble effigy of the late Bishop Ollivant, to be placed in Llandaff Cathedral, is by Mr. H. H. Armstead, R.A. The late Bishop is represented in his robes in an attitude of prayer, and the portrait is both truthful and sculpturesque. For the unmeaning and ugly costume adopted, the sculptor is not answerable, and the sofa cushion as well as sheet on which the Bishop reposes are only in harmony with the style of his dress. Mr. Armstead's second exhibit is the figure of "Ladas," designed for bronze. The subject thus selected is well fitted to remind workers that victory to be won requires no half-hearted, but the utmost efforts of any man, and this ideal of human effort is graphically expressed by this statue. The subject also has another meaning; but this is left by the author for our readers to guess. The Spartan runner is represented dying at the goal. Mr. W. Reynolds Stephens has a pleasing study in wax, a statuette called "Pigeons"; and Miss Henrietta Montalba shows a portrait of a girl in terracotta. Both illustrations are from the artists' own sketches.

ART METAL-WORK.

WE illustrate in this sheet some examples of art metal-work of good character by various architects, including Mr. Alfred Waterhouse, R.A., Messrs. Carpenter and Ingelow, Mr. Blomfield, and others, and made by Messrs. Singer and Co.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

FOR description see page 240.

"THE MOUNT."

THIS house is built on the Westerham Hill Park Estate, Westerham, Kent, from designs by Mr. A. A. Higgins, architect, 28, Budge-row, E.C. It is of red brick, with York stone dressings, the external timbering being of pitch pine; the roofs are covered with red tiles made in the neighbourhood. It stands in seven acres of ground, artistically laid out with sunk and winding paths, tennis lawn, fruit, vegetable, and flower gardens, and is approached by a winding coach-road, through an avenue planted with very choice trees and shrubs.

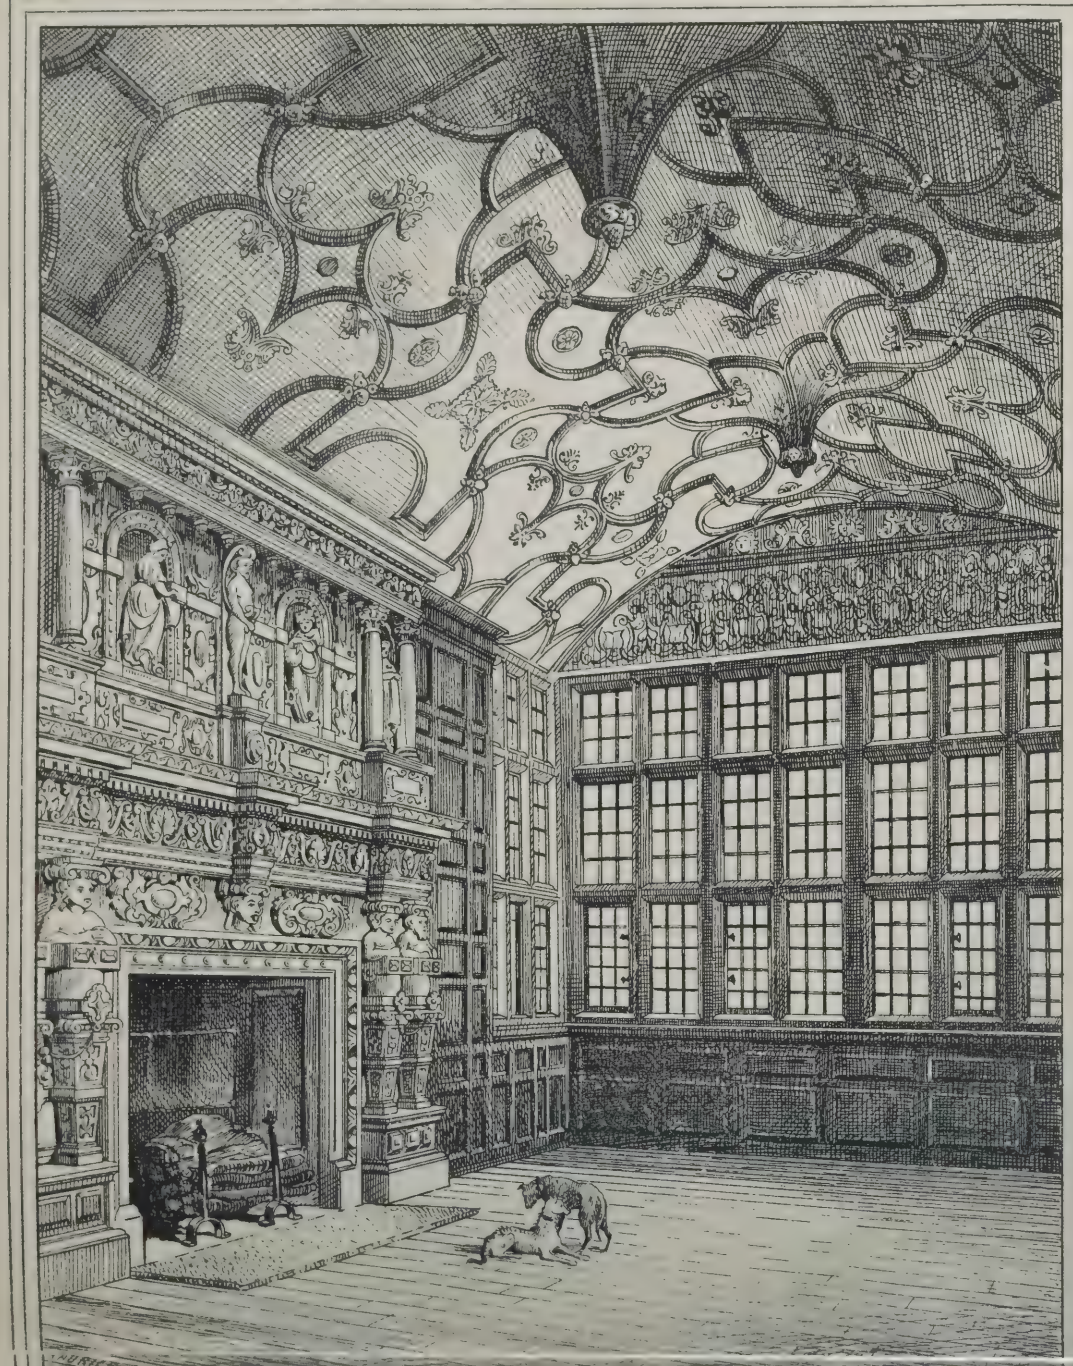
The house, stables, and conservatory form a very picturesque group on the south side of the hill, from whence lovely and extensive views are obtained of the beautiful Homesdale Valley and the great Surrey and Sussex landscapes. The cost of the house and stables is about £10,000, and the work has been well carried out by Mr. W. Smithers, of Westerham.

The estate, which is within one mile of the town of Westerham, is laid out with pretty winding roads, for the development of choice and snug sites in sheltered positions, on which are now being built houses of a similar description.

Pure spring water is obtained from a deep well on the estate, and pumped by powerful engines into a reservoir on the top of the hill, from whence the houses are supplied by gravitation.

ST. PAUL'S CHURCH SCHOOLS, HEATON CHAPEL, NEAR STOCKPORT.

THE schools are to be built in connection with the church, which has been erected some 10 or 12 years, the architects being Messrs. Bird and Whittenbury, of Manchester. The site has been generously given by Lord Egerton of Tatton, together with a donation of £400. The building will be faced with white-pressed bricks and buff terracotta dressings. A large room will occupy the front portion of the building, with a class-room on either side for boys and girls. An infants' room is provided at the back, with a separate entrance leading to the playground. The estimated cost of the work is £1,500. Messrs. Darbyshire and Smith, of Manchester, are the architects.



COMPETITIONS.

BRUSSELS.—The committee of the "International Exhibition of Sciences and Industry" invite competitive designs and plans for cafés and refreshment-rooms, also for waterclosets and urinals to be built on the grounds. Plans, elevations, and sections are asked for. Each competitor is to erect his buildings at his own cost on the ground with all accessories, and the plans and descriptive estimates are to be exhibited. Premiums in money, medals, and diplomas are offered, and each competitor may nominate two architects as members of the awarding jury. Offers to compete must be sent in to the offices, 22, Rue des Palais, Brussels, not later than Oct. 1st.

GRAVESEND BOARD SCHOOLS.—The Education Department have approved the proposal of the Gravesend School Board to purchase Baynard Castle and grounds for £1,450, in order to allow of a one-story, instead of a three-story school being built for the accommodation of 1,000 children. Accordingly instructions have been issued to the competing architects to proceed with the preparation of plans forthwith, the cost not to exceed £6,000, or £6 per head. The plans are to be in by the 31st inst.

OLDHAM CEMETERY.—The first premium for competitive designs for the new cemetery at Hollins, to be formed by the Oldham Corporation, has been awarded to Messrs. Potts, Pickup, and Dixon, architects, of Manchester and Oldham. It will be remembered that the conditions of the competition gave rise to a long correspondence in our columns in April and May last.

Referring to the notice in our issue of the 29th ult. respecting the opening of portions of Messrs. Lewis's new premises, Ranelagh-street, Liverpool, also of the consecration of St. Barnabas Church, Pendleton, in our issue of the 5th inst., it should be noted the floors of both buildings have been laid on Lowe's patent system of wood-block flooring.

WAYSIDE NOTES.

OF late we have had an abundance of fires of one kind or another — mountains, moors, and commons blazing, and houses and shops burnt to the ground, and now a really big affair at Westbourne-grove. Nothing so plainly indicates the ephemeral nature of our modern street architecture as an extensive conflagration. There are no elements of beauty or picturesque in the ruins of such buildings as shops and offices — no mobility in twisted girders and cracked stancheons and columns. Fire has, in past ages, tried the strength of faith of mankind, and has often been found powerless against the resolute will of many; gold may be tried by fire, and so, also, in a measure, may be a true public building. In a noble edifice the vital portions would suffer last. But observe the baseness of a construction whose very supports are the first to crack, twist, and bend, and thus let down the superimposed masses of brickwork and masonry.

However, as we are well in for a second Iron Age, we must make the best of the present state of affairs. It is useless to clamour for architectural piers when the builder demands flimsy-looking iron columns. The shopkeeper must have his vast sheets of plate-glass and the iron stancheon must be substituted for the enduring pillar of brickwork or masonry, to be in keeping with the new axiom for traders, that a man's business bears a direct ratio to the area of his plate-glass front. The capitalist, too, demands the greatest amount of space with the least possible area of support for his blocks of offices; and it is probable that if an architect, out of due regard for the claims of architecture, were to sacrifice the floor space to the area of support, he would run considerable danger of losing his client, who would look with favourable eyes on some of his more juggler-like brethren who can perform the feat of balancing a vast mass of building upon a few square inches of cast-iron. So it is necessary to move with the times; and as a matter of fact nothing is more valuable to the young architect of the present day than a thorough theoretical and practical knowledge of iron construction. They that run may read a lesson from the subjoined, which I take from the last issue of the late John Leech's excellent "Pictures of Life and Character."

"Jack Armstrong has painted a modern subject from real life, and painted it uncommonly well. Strange to say, he has sold his picture. Messrs. Feeble and Potter (*very high art men, who can't get on without Mediæval costume and all the rest of it*) think it a mistake. Curiously enough, *their* pictures are unsold!"

The particulars of the Gloucester Public Baths competition are well drawn up; but intending competitors will have to possess a thoroughly sound knowledge of baths and bath-fitting—swimming, private, and the so-called Turkish baths. It will be purely a matter of plan and arrangement, and knowledge will certainly be power in this competition. The Corporation say they require a simple, though effective, style of design for the elevations. They mean, in other words, a building whose appearance shall not depend on meretricious detail enrichment, but one whose unadorned composition shall be interesting and masterly.

A very peculiar set of particulars is that of the Denton Free Library competition. There are several objectionable features in the stipulations. The architect will not be required to superintend the erection of the building; £26 5s. will be paid to him as full compensation for the drawings and specifications; the building is not to cost more than £1,500, *and a tender to that effect must accompany the drawings.* I trust the committee of the D. and H. F. L. and S. C. will receive some good designs.

It is remarkable that so few towns or boroughs have so far availed themselves of the Free Libraries Act. The tax upon the ratepayers, which, I believe, cannot exceed one penny in the pound, is really very slight. A gradual awakening to the advantage of the Act may, however, be noted; and it behoves all architects, especially competing ones, to become thoroughly acquainted with the necessary features and details of such institutions.

Another peculiar class of buildings that are now frequently, and will probably in future be still more, in demand is the Technical School. We may expect many competitions for such edifices. I have not seen Mr. E. C. Robins's book, but should think it would be valuable to the architect. There has been lately a good deal of talk about technical education, both in and out of Parliament.

I note a question in the House touching the condition of the Church of St. Mary-le-Strand. The building is reported to be in such a state that it had been declared by the Metropolitan Board of Works to be a dangerous structure. Rather a surprise this to many of us, though the stone that was employed in the construction of the church appears to be very untrustworthy. Some time back, it will be remembered, one of the stones in a column of the semi-circular west porch cracked, and had to be replaced. The building may be said to be constantly in fear of being swept away by the ever-increasing traffic, through the medium of the Board of Works. The Board, it appears, have before them suggestions for the widening of the Strand, hereabouts, "either by the removal of the south side of Holywell-street or by the removal of the church." We may be prepared, before long, for the wholesale disappearance of this thoroughfare, and also the two Classic churches that guard either entrance to the street. It would be absurd to take away the block of buildings at the end of Arundel, Norfolk, and Surrey-streets, without the churches, as by so doing a regular *cul de sac* would be formed for vehicular traffic.

The Sanitary Institute of Great Britain holds its tenth Autumn Congress this year at Bolton, from September 20th to 24th, under the presidency of Lord Basing. Let us hope the S.I. will turn their attention to the ventilation of public sewers. It is not easy to see what benefit those who dwell in towns can derive from "sanitating" their houses, if the effluvia from the street ventilators be unluckily near their abodes.

There has been a good deal of talk lately about the insanitary state of Margate. To those who know this breezy watering-place, it would appear that there is a good deal of imagination called in to exaggerate the evils complained of, although, certainly, some startling facts were disclosed with regard to the town. But I sympathise with the place in its troubles, and must confess that, be its sanitary condition what it may, it seems to me pleasanter to stroll along its sea-shores than to walk down a London street with one's weather eye open to enable one to steer clear of the pestiferous breath of the sewer ventilators!

The gondoliers of Venice have followed the lead of the Midland Railway drivers, and gone out "on strike." Their grievance is said to be the establishment of a night service on the Grand Canal. Further, the journeyman bakers have struck, and there is a threatened strike of waiters at hotels and cafés. How pleasant! The travelling architect who may be engaged in sketching in the glorious old city will bless the gondoliers. Touching the old architecture of Venice, I can only conclude that it is absolutely necessary to *see* St. Mark's and the adjoining Palace in the Piazza, in order to be able to appreciate their wonderful beauty; as, with all my admiration of Mr. Ruskin, I cannot, by the aid of paintings or photographs, grasp the principles that should lead one to understand the good points in the composition of St. Mark's or the skyline of the Palace. Perhaps it is that in the sunny South colour and detail are of infinitely more moment than that effect of mass and outline which is so necessary in our duller Northern climate. GOTH.

A stained-glass window in the side chapel of Helmsley Church was unveiled on Sunday week. It has been executed by Mr. M. Milner, of London, from designs by Mr. R. Temple Moore, of Hampstead.

A new organ built by Messrs. Duncan and Son, of York, was opened at Airmyn parish church, near Goole, on the 4th inst.

Building Intelligence.

CARDIFF.—The first Unitarian church erected in Cardiff was opened on the 3rd inst. It is situate in West-street, Tredegarville, is Free Classic in character, and has been erected from designs by Mr. Bruton, of Cardiff, at a cost of £2,700. It seats 160 worshippers, but extra seats affixed to hinges on the walls increase the accommodation to 212. The materials used are red pressed brick, with dressings of Hamhill stone. The schoolroom below the church accommodates 180 children. The floor of the upper vestibule is of fireproof construction, carried by rolled iron joists supplied by Messrs. Homan and Rodgers, of London and Manchester. The seats are of pitch-pine. The contractors were Messrs. D. C. Jones and Co., of Gloucester.

DODDISCOMBSLEIGH. — Doddiscombsleigh Church, which was restored about nine years ago, at a cost of £1,000, possesses features of much interest. Its chief attractions are the fine old glass windows in the north aisle. The work just completed consists of reseating the whole of the interior from plans by Mr. Harbottle, of Exeter. The rough forms have been removed and appropriate wainscot oak seats have taken their place. On each side of the chancel aisle are choir seats and carved oak reading-desks, and on the north side of the chancel there is a carved oak parclose screen. Some of the very old seat ends have been restored and refixed by the contractor, Mr. John Periam, of Topsham. The organ, which is at the west end of the south aisle, has been much improved and new pedals added by Mr. Guest, of Exeter.

EXMOUTH.—The scaffolding is being removed from the new Public Hall, which is rapidly approaching completion. It is being built from designs by Mr. John Johnson, of Queen Victoria-street, E.C., selected in competition, and fronts the Strand Public Gardens at the corner of Rolle-street. The style is a French type of Renaissance freely treated. The hall is faced with Exmouth red bricks, with dressings of Beer-stone, from the old quarries near Seaton. The frontage towards Rolle-street is 66ft. wide, and is three stories high, with hipped mansard roofs at each end. These roofs are covered with Welsh blue slates, and have metal crestings, by Messrs. Downey and Co., of London, and in the centre is a timber and lead turret containing a clock. The great hall is 50ft. by 80ft. by 40ft. high. Its windows are circular-headed, and it has a stage. There is also a lesser hall adjoining the bigger one, measuring 44ft. by 23ft. The main staircase and landings are of Portland stone. The lower set of rooms will be used as general offices, and above will be the Local Board offices, and offices for the town clerk and surveyor. There are also a school of art, measuring 23ft. by 21ft., and other rooms. The general contractor is Mr. W. H. Perry, builder, of Exmouth; Mr. Henry Passmore, of 63, Victoria-road, Exeter, is the clerk of works; and Mr. Harry Hems, of Exeter, executed the carvings. The entire cost will be about £5,000.

FAZACKERLEY.—The foundation stone of new cottage homes for children, about to be erected in Long Moor-lane, Fazackerley, by the guardians of West Derby Union, was laid on Tuesday. The land covers 38½ acres, and cost £5,555. The plans were prepared by Mr. C. H. Lancaster, of Liverpool, and tenders were obtained from about 50 contractors, with the result that that of Messrs. Kelly Brothers for the building has been accepted, amounting to £53,550, and that of Messrs. Catterall and Co. for the road making and drains, amounting to £6,744, making a total of £60,299; the architect's estimate being £61,000. The various buildings, leaving out the Probationary Homes and the Infirmary, will accommodate 570 children, equal to about £105 per child for structural cost. The scheme has been arranged to represent a small village. A main road, 80ft. wide, runs off at right angles to Long Moor-lane. On the left of entrance gates will be the entrance lodge, and also clothes stores; and on the right will be the probationary homes, capable of holding forty children. On either side of the main road will be the cottage homes —one side for boys and the other side for girls,

each under a father and mother. Each home will accommodate 30 children, and contain sitting and bedrooms for foster parents, dining and day rooms, entrance hall, kitchen, scullery, pantry, lavatories, bathroom, and three large dormitories on the first floor. There will be a laundry and a wash-house attached to each girls' home, in an outbuilding. Centrally situated are the workshops, stables, coach-house, office, small laundry, and a swimming bath, 60ft. by 25ft.; the infirmary, superintendent's residence and committee room, the Kindergarten school, and the central hall. The building will be carried out in red pressed brick, with Storeton stone dressings.

Hanley.—The theatre was reopened last week, after remodelling from plans by Messrs. C. J. Phipps, F.S.A., and F. Matcham, of London. Mr. J. Turner, of Hanley, was the builder. The pit, which is paved with wooden blocks, will accommodate 1,100 people, its dimensions being 56ft. by 52ft. There will be, in connection with it, a refreshment bar and ladies' cloak-room. The circle will contain four rows of easy chairs, and behind these is a promenade and upper circle, each seating about 250 persons. Refreshment rooms are provided at each of the tiers. The gallery will hold 1,000 people. The old entrances will be used at present; but when the building is completed the entrances from the pit and boxes will be from Pall Mall. In the case of a crush, all the doors can be at once thrown open. The stage contains ample accommodation for actors and actresses, there being 12 new dressing-rooms. The depth of the cellar containing the appliances for the lifting of heavy scenery, &c., is 18ft., and the stage, which is laid in 20 sections, is 92ft. in width and 46ft. deep.

Pimlico.—The foundation-stone of St. Philip's Church, Buckingham Palace-road, was laid on Wednesday last by Lady Grosvenor, as proxy for her Grace the Duchess of Westminster, who was prevented by illness. The parish is to be formed out of St. Michael's, Chester-square. The Duke of Westminster has given the site and £3,000, and it is expected that the Ecclesiastical Commissioners will augment the endowment. The church will consist of nave and chancel, north and south aisles, transepts, and morning chapel, and will accommodate 750 persons. Clergy and choir vestries, to be used also together as a parish room, with organ chamber over, are arranged on the north side of chancel. The materials used are Gainsbro' bricks for outside facing, with Lawrence's brick strings, &c., and Doulting stone for sills. The core of the walls is of concrete, inside Corsham stone is used for dressings, and the walls are plastered, the roofs are of pitch pine, with boarded ceilings and covered with Broseley tiles, and there is a flèche 100ft. high above the nave floor, covered with copper, at the crossing. The cost of the fabric, exclusive of fittings, is about £6,000. Messrs. Demaine and Brierley, of York, are the architects; Messrs. Macey and Sons, Strand, are the contractors; and Mr. T. W. Creed is clerk of works.

Preston.—A new chancel, reredos, and additions to the carved altar at St. Ignatius' Roman Catholic Church, Preston, were inaugurated on Sunday week. The old altar, which is richly carved and panelled with statuettes of our Lord and the Apostles, was designed by Scoles when the church was completed over half a century ago, and is a work of considerable merit. It has been added to by the construction of a carved retable and tabernacle of polished Hopton Wood and Derbyshire fossil marbles, and a canopy of Caen stone, rising to a height of 10ft. The reredos, completed last year, except the return compartments next the side chapels, which have just been erected, is designed on the model of the Mediæval works seen in the Oxford College Chapels, St. Alban's and Winchester Cathedrals, having a series of niches for statues, and being a portion of the architectural construction of the church. The works have been carried out partly by Mr. Tory and Mr. Webster, of Sheffield, and Mr. Wall, of Cheltenham, from the drawings, and under the supervision, of the architect, Mr. Hadfield, of Sheffield. The tabernacle door, richly chased, gilded, enamelled, and jewelled, is in hand from the designs of Mr. Bentley.

Shah Jehan Mosque.—It is proposed to erect a mosque at the Oriental University, Woking, and the designs of Mr. W. I. Chambers have been selected and approved, and he has been instructed to proceed with the building forthwith. The design is in the Saracenic style, comprising the usual courtyard, sacred tank, and pavilions. The building is crowned by a magnificent dome surrounded by minarets. The interior will be panelled in marbles. The site adjoins the Indian Memorial House to Sala Jung, in course of execution from the designs of the same architect. This building is in a refined type of Northern Indian architecture.

Warminster. — The parish church of St. Denis was originally built about the time of Edward III.; but the main body and aisles were rebuilt upon the old foundations in 1724. It is contemplated to again rebuild all the work of last century, and designs have been prepared for this purpose by Mr. Arthur W. Blomfield, M.A., of London. The first section of this work has just been completed, and consists in the renovation of the chancel. The old walls still remain, but an organ chamber and a vestry have been added on the north side. The Norman remains in the east side of the north transept, and in the eastern end of the south aisle, have been preserved. The stone used in rebuilding the walling is from Frome, and the dressings are of Box Ground stone. The roofs are of oak, supported by carved corbels, the intersections of the ribs and purlins being stopped by bosses, and the wall plates have carved pateræ. The internal walls are stuccoed. The stalls are carved in oak. There are dwarf parclose and chancel screens in wrought iron by Messrs. Singer and Sons, of Frome. The steps are of Purbeck, and Godwin's tiles are used. The reredos is of stone, and has a double super-altar. This has five recessed panels, and contains much canopied and pinnacled work. It is surmounted by a pierced cresting, and statuettes of angels are carved at either end of the centre part. The general contractor for the restoration is Mr. W. Strong, of Warminster, and Mr. T. Simpson is the clerk of works. Mr. J. Gaisford, of the same town, has executed the wood-work, which is all in oak. The carving in wood and stone and all the sculpture is the handiwork of Mr. Harry Hems, of Exeter.

CHIPS.

A memorial of the late Mr. Thomas Dudley Ryder, first registrar of the diocese, was placed on Wednesday in the south aisle of the chancel of the Manchester Cathedral. The memorial, which has been raised by Mr. Dudley Ryder's younger brother, Admiral Sir A. P. Ryder, consists of a bordered brass, mounted on an enamelled black marble slab, and has been executed by Mr. Thomas J. Gawthorp, of Long Acre, London. It has been placed on the wall of the south-east bay of the chancel aisle, in immediate proximity to the chapel just raised in memory of Bishop Fraser.

Extensive additions to the Oakbank school of the Glasgow School Board were opened on Friday. The new building accommodates on the ground and first floors 600 scholars. On the second floor are the science, art, and cookery rooms, together accommodating 150 pupils. The accommodation of the old school was 930, and with the addition of 600, there will now be places for 1,530 scholars in the ordinary branches, and for 150 in drawing, science, and cookery. The cost of the additional new ground was £2,500, and the building cost £9,000.

A new Wesleyan chapel is about to be built at the corner of the Parade and Newhall-street, Sutton Coldfield. It will be seated for 400 persons, and in the basement will be school and classrooms. Mr. T. Guest, of Corporation-street, Birmingham, is the architect.

The foundation-stone of new Salvation Army barracks was laid at Kettering last week. The building will be erected in brickwork with stone dressings, and will measure 100ft. by 46ft., and 36ft. in height. Messrs. Saunders and Gotch, Kettering, are the architects, and Mr. F. Barlow, of Rothwell, is the contractor.

A Congregational church, erected at a cost of £2,200, was opened in Langate, Beverley, on Wednesday week. Mr. R. Potts, of Beverley, was the contractor.

The Dundee Police Commissioners adopted on Monday a modified scheme prepared by the burgh engineer for the erection of a fever hospital, and instructed the engineer to prepare plans for the first section, consisting of two pavilions, each for 18 patients, and half the administrative department, the cost of this portion not to exceed £9,000.

Engineering Notes.

Aberdeen.—At a meeting on Monday of the Aberdeen Harbour Board, Mr. William Smith, the engineer, submitted an additional report on the damage caused by chemical action of the sea water on the concrete entrance works of the graving dock, in which he suggested the appointment of a consulting engineer in connection with the matter. Mr. Philip Messent, engineer to the Tyne Commissioners, to whom it was remitted to examine and report on the condition of the graving dock, also had an interview with the Commissioners on the same day. The engineer said there was about one-third of the work completed, and there was immediate danger to the pier. The board decided to allow the work to proceed.

The Inventors' Institute.—A large party of members made an excursion down the Thames on Monday. The Thames Subway was examined under the direction of Mr. Greathead. Both tunnels are completed the whole way across for a distance of 1,500ft., and are proceeding rapidly towards the Borough. The cantilever bridge for the passage of the Indus at Sukkur, intrusted to Messrs. Baillie and Westwood, of Poplar, was also seen. The torrential character of the stream necessitates the whole span of 790ft. being accomplished without support. The first section is a heavy erection at Sukkur. A second is finished, and now stands erected at Poplar. Every piece is numbered and stamped, and the portions variously painted so that each may be selected and put in place in the permanent erection. The ascent was made to the top, 180ft., whence a fine view of the Thames and of this structure was obtained. The Victoria Docks, under permission from Colonel Martindale, were visited, the resident engineer, Mr. Thomas, drawing special attention to the new pumping station for supplying from the river the loss of water by the locking of vessels. The pumps throw into the Docks 125,000 gallons per minute, and raise the whole 180 acres of water 1½in. per hour. Some interesting experiments were afterwards made with the respirators in use in the German Navy, a man remaining in a closed building for ten minutes enveloped in dense smoke, and being able to endure this for even a longer period, the air being perfectly filtered by the apparatus.

The Crystal Palace School of Practical Engineering.—The annual presentation of certificates to the successful students took place on Saturday, being made by Mr. William Shelford, M.Inst.C.E. Mr. F. K. Shenton, superintendent of the school, read the examiners' reports. The examiners, Mr. W. W. Colman, A.M.I.C.E., and Mr. Henry Law, M.I.C.E., stated that in the mechanical engineering section of the school the results of the examination had been very satisfactory, and in the drawing office and fitting shops surprisingly good. It was to be regretted, however, that the students had not properly appreciated the necessity of working harder in the pattern shop, a department of great importance. In the civil engineering section undoubted progress had been made. The manner of work among the students was very satisfactory. There were in the first and second years' course over 70 students who received awards of merit. The first places were secured respectively by H. G. Lloyd for the lecture examination on Railway Work, A. W. Pearson in the Drawing-office, E. A. Glover in the Pattern Shop, H. P. Miles in the Fitting Shop, and E. J. Bowman, W. E. Underwood, E. J. Prew, and W. Bosman in the several sections of the Civil Engineering Division. To the latter student, who is the scholar of the Government School of Hongkong, the bronze medal of the school has been awarded, he having obtained during his course of study the necessary nine certificates, the largest number obtainable. Mr. Shelford observed that in the engineering profession many young men, no doubt, wished for permanent appointments at fixed salaries; but in the higher branches of the profession these positions were scarce, and though in the lower branches they were probably as common as in most other professions, the young man with ambition and a consciousness of power would avoid permanent appointments as being less independent and

ss remunerative on the whole. The profession of engineering had a great future before it, e necessity for development of the means of mmunication at home and abroad and the neral expansion of England being sure arantees of employment to the engineer. He uld urge the students to continue to do their st, and then they would find how true was e maxim that there was a square hole for ery square man.

The Mersey Subway.—Consequent on the ccess of the Mersey Tunnel Railway, which s now been in operation for a year, steps are ing taken to construct a subway between verpool and Birkenhead under the powers of Act obtained some time since. Operations ve just been commenced. The subway comny have purchased a piece of land in Johneet, Birkenhead, from Messrs. David Roberts, n, and Company, timber merchants, close to e Hamilton-street Station of the Mersey railay. This ground (which is about 30ft. from e Mersey Tunnel works) has been inclosed, d already a number of men are employed in king a shaft through the red sandstone, hich is taken up in large blocks. These blocks e carted away and used for building purses. The shaft, which is eight yards square, s been already sunk to a depth of about 60ft., t the intention is to carry it to a depth of 0ft. The contractors for sinking this preliinary shaft are Messrs. William Maddocks d Company, Corporation-road, Birkenhead. ie main shaft, through which the heavy affic will pass by means of a lift or lifts, will contiguous to the small shaft, and will be 0ft. long by 30ft. wide. On the Liverpool le the shafts will be at the Goree Piazzas. It expected that the undertaking will be cometed in about three years.

CHIPS.

The first stone has been laid at Storrington of a ilding which is to serve temporarily as a Priory the Sons of St. Norbert. The future building ill comprise cellars in the basement, and on the ound floor, flanked by a long corridor, kitchen, fectory, and three reception rooms; on the first or the rooms of the religious and four bedrooms guests; on the second floor store-rooms, &c. e material will be red brick with white brick ings; with the exception of the Gothic arched orways the style will be plain; under the centre ple facing the old parish church will be a niche ntaining a statue of the Blessed Virgin holding e Divine Infant.

It has been resolved that the memorial to the e Bishop of Sodor and Man at Sheffield shall e the form of a "Rowley Hill Chapel" and a ained-glass window in the parish church.

At the recent congress of the British Medical sociation in Dublin, Dr. T. Churton, of Leeds, ad a paper on "The Registration of Plumbers ad of Plumbing Work," showing the evil result of fective work, and as a result of the subsequent scussions, a resolution was adopted expressing a ong opinion that an organised efficient system of gistration of plumbers and plumbers' work ould be put into force in all parts of the United ingdom.

A lecture-hall in connection with and contiguous the Hamilton Presbyterian Church, Lairdset, Birkenhead, was opened at the end of July st. The size of hall is 40ft. by 24ft., with waggonhaded ceiling, finished in pitch-pine, and has ating accommodation for nearly 200. Mr. W. H. rde was the contractor, and the cost about £450. r. James N. Crofts, of Liverpool, was the archit t, who also designed and carried out the church a ew years ago.

A copy of the design for the Imperial Institute Messrs. Deane and Son, as produced in photolio. by the Building News, has been introduced into the Museum of Science and Art in Dublin. The authorities may have been in doubt as to where to classify and locate a novel form of exhibit in a museum, but for the present it is to be found among "Ornaments of Savage Tribes" in the Quadrant Gallery.

A new reredos, Perpendicular in style, is being placed in Welby Church, Lincolnshire. It is entirely of oak, and has been carved and constructed by Mr. Harry Hems, of Exeter, from designs by H. Withers, F.R.I.B.A., of Adam-street, Adelphi, WC.

The Nantwich Local Board have received a report from Mr. Balwin Latham, M.I.C.E., of Westminster, on the improvement of the water-supply, in which he suggests the immediate execution of new works estimated to cost £1,100.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Association of Municipal Engineers.—A Northern Counties district meeting will be held at Newcastle-on-Tyne to-morrow (Saturday). The members will assemble in the Council Chamber at the Town-hall at 11.30 a.m., when a paper on "The Floating Hospital of the Tyne Port Sanitary Authority" will be read by Mr. W. G. Laws, city engineer, Newcastle. The members will afterwards adjourn to the Exhibition, where the rest of the day will be spent.

Bristol and Gloucester Archæological Society.—The twelfth annual meeting of this society was opened on Monday, and will close to-day (Friday). The party, over 100 in number, arrived by Midland train, and the opening meeting was held under the chairmanship of Sir Henry Barkly, K.C.B., who introduced the new president, Lord Sherborne. The annual report, which was read by the general secretary (the Rev. W. Bazeley), dealt with a variety of topics connected with old Gloucestershire. Lord Sherborne then delivered his presidential address, which had reference chiefly to manuscripts and antiquities of the Manor of Sherborne, and of the cartulary of Winchcombe Abbey, recently discovered after being mislaid for many years. The members afterwards went to the parish church, where the Rev. F. Smith gave an account of the ancient collegiate foundation, and showed the tombs of the Shakespeare family, the old register, monuments, &c. Thence the party went to the Guildhall, the Grammar School, and the Chapel of the Holy Cross, which were described by the Rev. R. S. de C. Laffan, who, in the latter place, gave an account of the frescoes and allegorical paintings discovered many years ago. At New Place, the last residence of Shakespeare, Mr. Sam. Timmins took charge of the party, and under the same guidance they inspected the poet's birthplace and the collection of books and relics in the museum. The annual dinner took place in the Town Hall in the evening, and subsequently a meeting was held for the reading of papers. The members made an excursion on Tuesday to Warwick, where the castle, museum, St. Mary's Church, and Leycester Hospital were seen under the guidance of Messrs. F. H. Moore and T. Lloyd, and on Wednesday they visited Compton Wyngates, the Early 17th-century seat of the Marquis of Northampton.

Bristol Master Builders' Association.—The members of the Bristol Master Builders' Association had their usual outing on Tuesday, when they visited Frome and Longleat. At Frome they visited the parish church, under the guidance of Mr. W. Singer, who next invited the members to see the art-metal works of his firm, in which about 100 men are employed. Among the works in progress in the shops are iron gates for St. Mary Redcliff, Bristol, fittings for St. Mary's, Tyndall's Park, and a reredos for a church in London. The members were then conveyed in breaks to Longleat, the seat of the Marquis of Bath, about four and a half miles from Frome. Both the exterior and interior of the reservoir were examined. In the evening the party dined at the George Hotel, Frome, under the presidency of Mr. W. Brock, the vice-chairs being taken by Mr. T. R. Lewis and Mr. G. Humphries. Among those present were Messrs. J. Yalland, A. Krauss, W. Singer (Frome), J. Bastow, A. Barratt, R. Bancroft (Bancroft and Harris), Bradshaw, Jabez Eastabrook, Church, J. Cox, Geary (A. Gardiner and Sons), J. Hill, E. T. Hatherly, C. A. Hayes, Johnson (Jones and Wainwright), Kepple (John Hall and Sons), J. Perkins, G. H. Perrin (Taylor and Low Brothers), B. Price, Bryant, H. J. Rossiter, G. Bessell, A. Scull, P. Triggs, G. F. Jones, J. Wilkins, E. Walters, G. Wilkins, and A. Beacham (King Brothers). After dinner "The Mayor and Corporation of Bristol" was proposed by Mr. P. Triggs, and acknowledged by Mr. J. Bastow. Mr. J. Yalland gave "The National Association of the Master Builders of Great Britain." Mr. A. Krauss responded. Mr. G. H. Perrin proposed "Success to the Bristol Master Builders' Association." Mr. W. Brock (the president) responded. Mr. T. R. Lewis submitted "The Merchant Traders connected with the Building Trades." Mr. Bancroft responded.

National Association of Master Builders of Great Britain.—The half-yearly meeting of this association was held last week at the Grand Hotel, Glasgow, when representatives from the following local associations were present:—London, Liverpool, Manchester, Birmingham, Leeds, Bolton, Bradford, Lancaster, Glasgow, Edinburgh, and Greenock. The report and accounts for the past half-year were approved and adopted, and other business relating to the building trade was discussed. The representatives attending the meeting accepted an invitation from the master painters of Scotland to a trip through the Kyles of Bute, and on their return in the evening were entertained at a banquet at the Grand Hotel.

Northern Antiquarian and Scientific Societies at Elgin.—A joint meeting of the above societies took place on Friday and Saturday at Elgin. On the former day the visitors inspected the Museum and the Bishop's Palace, which Colonel Culbard described. A meeting was afterwards held in the Gordon Arms hotel, under the presidency of Dr. Duff, Elgin. Mr. Wallace, rector, High School, Inverness, gave an interesting address on the archæological remains to be found in the basin of the Beauly Firth. Regarding vitrified forts, he pointed out that there was no doubt they were used for military purposes. Aided by drawings of a number of these forts in the parish of Kirkhill, and also near Beauly, Mr. Wilson described them at considerable length, pointing out that at points where they were easily accessible to the enemy special pains had been taken to make the fortifications safe and complete. Mr. Mathieson, head master, Elgin Institution, read a paper on "Celtic Place names in Morayshire." Subsequently a supper was held, at which Dr. Duff, president of Elgin Association, presided. On Saturday, the party drove by Cutties Hillock quarries to the old castle at Duffus, and from thence to Burghead and along the coast to Lossiemouth.

CHIPS.

At the Birmingham Assizes on Friday, before Mr. Justice Wills, an action was brought by Harriet Timmins, a single woman, living at Leicester, against Thos. Croft Furnace, builder, of Tipton, to recover £5,000 damages for breach of promise to marry. The Jury returned a verdict for the plaintiff—damages £500.

The local board of Swanage have adopted plans and a scheme prepared by Mr. Heward, C.E., for the sewerage of the district.

Mr. Edwin Richardson, the Mayor of Sunderland, has presented to the Art Gallery of that town Mr. C. Pettafer's picture, "Fishing Boats leaving Harbour, Polperro, Cornwall," which was exhibited at the Royal Academy.

The framework of the Glasgow Exhibition Buildings is being rapidly put together on the ground at Overnewton, and on Monday the first arch was raised into position. The contractors for the stand, pavilion, outer and inner palings, gates, and all other wood and iron work are Messrs. F. Braby and Co. (Limited), of Glasgow.

A font has been presented to St. Anne's R.C. Church, Rock Ferry, Liverpool. It is constructed of Derbyshire alabaster, supported by Rouge Royale and Irish green marble columns and brown Belgian marble base, the whole resting on a Mansfield plinth. The cover is of dark English oak, ornamented with Gothic ironwork. There are four carved panels. The font is the work of Mr. J. Currie, London.

To a new parish church dedicated to St. Lawrence, at Burwarton, Salop, built at the expense of Viscount Boyne some years ago, close by the remains of the original Norman edifice, an addition has just been made through the generosity of the same donor. The organ has been enlarged by Messrs. Nicholson and Co., Worcester, and during the past week a front of carved oak in the Decorated style of Gothic art has been erected by Mr. Harry Hems, of Exeter. The lower part of the case is of tracery panelling with sliding doors, flanked at either end by buttresses. These are gabled and carved, and are carried up the full height of the pipes, terminating in crocketed pinnacles. The pipes show through the woodwork, whilst the upper work is supported by brackets carrying an embattled cornice, the whole being surmounted by a pierced cresting.

At Eastleigh, Hants, last week memorial stones were laid of a new Bible Christian hall. Mr. Harris, of West End, Southampton, is the builder of the hall, which will seat 200 persons.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

RECEIVED.—J. and Co.—C. and G.—T. N. D. and Son.—W. G.—M. R. Co.—W. G. B.—M. C. and Co.

HUDSON EARLE. (Yes.)

Correspondence.

THE CARPENTERS' COMPANY AND CLERKS OF WORKS.

To the Editor of the BUILDING NEWS.

SIR,—I notice that Mr. Potter, in that portion of the paper on Clerks of Works which appeared in your issue for 5th August, supports the desirability of examinations for those useful members of the building craft.

Permit me to draw the attention of your readers—especially such of them as are Clerks of Works—to the examinations and certificates in carpentry and joinery just instituted by the Worshipful Company of Carpenters, of which I have the honour to be a member and an officer. We did at one time entertain the idea of constituting this an examination with a wider scope; but it has been thought prudent to limit it to the trades with which we are specially connected. But within these limits no pains will be spared to make the examination very searching, so that the certificate shall be a valuable testimonial to the skill, knowledge, and experience of the holder, as far as work in wood goes. As you have already pointed out, copies of the programme and of the specimen questions can be had by applying at Carpenters' Hall, and I hope any person obtaining them and making himself familiar with their contents will be satisfied that the Carpenters' Company's certificate will be a most valuable testimonial for every Clerk of Works who can obtain it.—I am, &c.,

T. ROGER SMITH.

POST-OFFICE, KNUTSFORD.

SIR,—How far the concession that the "upper portion of façade was suggested by an old house at Ipswich," and the admission of "the slight similarity" to the New Zealand Chambers will content those who have compared the designs in question, I cannot, of course, judge. To me there is no similarity between the Post Office at Knutsford and the Chambers in Leadenhall-street. The one is a translation from the other, point by point, from the ground to the sky line, so far as it was applicable. Of resemblance, there is truly none.

Mr. Owen claims that his building was "designed to harmonise with the surroundings, the style selected being somewhat typical of the various examples to be found in the neighbourhood"; and going for a *motif* to Ipswich to secure this local feeling, he has naturally to prune away what was Suffolk in character and spirit. But was he serious in describing his clarified design as being in a style selectedly typical of Cheshire houses, or is it only his fun?—I am, &c.,

HALSEY RICARDO.

13, Bedford-square, Bloomsbury, W.C.,
Aug. 10.

EAST GRINSTEAD COMPETITION.

SIR,—Some three weeks ago the East Grinstead Local Board invited competitive drawings for their proposed new offices, &c., and I applied for particulars, which I received (and which are worthy of your perusal as being a fairly good specimen of the very vague and uncertain—and, if I may be allowed the expression—"empty" set of particulars now and then issued for the guidance of competitors).

My drawings were accordingly prepared, duly packed in a case—not having the time at my disposal to mount them on stretchers—and forwarded the Saturday preceding the Monday, at which time they were to be in (Aug. 1st).

They were returned to me on August 6th, having been sent by book post; but the Post-office, in the transmission, sent them on by parcel post (the rubber stamp on them telling me they were too long for book post), for which I had to pay 2d., and have my drawings written on with blue pencil, and with the prints of an indiarubber stamp, the postage stamps, date stamps, and other official markings—the board not taking the trouble to place them in a cover or protection of any description, or even to return them in my own case, or to trouble themselves to find out whether or not they would go "book post" or "parcel post," or what not, or even to protect them in the slightest degree; and I need hardly say there was no sign of even the ordinary letter of thanks in returning my crumpled and crushed drawings, or the least sign of where on earth they came from. I leave your readers to form their own opinion of this, I hope, unusual treatment received from a public body, such as the East Grinstead Local Board.—I am, &c.,

London, E.C., Aug. 9. F. W. F., M.S.A.

FIRE!

SIR,—The tremendous destruction wrought last Saturday upon Whiteley's gigantic premises is surely sufficient, without the other conflagrations round London, to create much matter for consideration—whether we are erecting the enormous buildings that the present condition of trade seems to require in a safe manner, and whether we have any means of stopping the spread of fire if it once takes hold of these great buildings.

The buildings which were consumed last Saturday were for the most part of the most approved construction; nothing that is called combustible entered into their composition—bricks, stone, iron, and cement are not generally supposed to "burn"; but what was the result? That the place was almost as readily consumed as if it had been the work of the jerry builder!

But the worst of it is, that although this great fire transcends in its magnitude any calamity that has taken place in London for many years, it only repeats on a large scale that which takes place daily on a smaller scale. I can find no instance, when the structure has become what the firemen call "well alight," where they have been able to stay or put out the fire. The firemen, with their beautifully-constructed engines, and the men, agile as cats and brave as seamen always are, direct their hoses in the midst of the burning building, apparently valuing their lives as nothing, and doing their duty as brave men, but with what result? They can certainly shower water upon those adjacent buildings that are not already on fire, and thus prevent the spread of the conflagration; but in no instance do they grapple successfully with a building in which the contents, heated like a furnace seven times, give out so much caloric that the streams of water turn to steam before reaching the blazing structure, being utterly incompetent to cope with the great heat evolved.

The true meaning of this utter insufficiency on the part of our fire brigades appears to me to lie for the most part in the false security that is given by the term "fire-proof." We know that when iron, bricks, plaster, or cement are subjected to ordinary heat they do not burn so we hastily call them incombustible, and call any buildings composed of them fire-proof. We then fill these buildings with wood, paper, grain, jute, and other inflammable substances which, when "well alight," produce a heat which no ordinary building is calculated to defend, and the whole place burns down together. Not satisfied with which, we also permeate these said "fire-proof" structures with gas-piping, which constantly feeds the flames with a steady flow of inflammable gas.

Let us acknowledge at once that no building that contains inflammable matter can be fire-proof. All sublunary substances will burn if they are submitted to a sufficient heat, and, therefore, a carefully constructed building is only less combustible than one constructed without any regard to such disasters, and, indeed, can only be considered to be so when none of its contents will readily burn.

If we are quite ready to face the truisms, which I only venture to have inflicted upon the readers of the BUILDING NEWS because they do not seem to be generally appreciated or grasped, we shall be more in the humour to face the problem that still lies before us, which is this: As all buildings, without exception, are in danger of burning, what is the best means of extinguishment when their contents become alight? Water will not put it out; chemicals cannot be used, because any chemical that will utterly destroy fire will also destroy any life that may be waiting for rescue in the burning building. Has steam been tried on a large scale? Surely, with the means and appliances at hand, steam, even super-heated steam, which by its own force could be ejected to great distances, would be more effectual that streams of cold water.

Please accept these crude remarks, the importance of the subject being my best apology for them, and I hope that they will call forth the attention of some of your readers who have already given attention to the subject, and who can give the world the benefit of their experience through your columns.—I am, &c.,

FREDK. ROGERS.

STONE THE WRONG WAY OF ITS NATURAL BED.

SIR,—It seems to me that the case referred to in your last issue by Mr. Stevenson is not exactly similar to that mentioned by Mr. Percival, but is capable of easy explanation.

I should imagine that the corner stone is laid having the natural bed facing the south, and the section through the layers facing the west, and if this should be the case, would not the casting of the layers off the south face be quite accounted for by the action of the frost? Probably perpendicular "furrows" might be found on the west face.—I am, &c.,

F. R. OGLESBY.

Mablethorpe, Aug. 6.

SIR,—Mr. T. Gilbert Stevenson, LL.D., architect, referring to stones not set on their natural bed, instances a quoin stone in St. Jude's Church, Southsea, improperly set, and wonders why only one face is "peeling off." Can he not easily see that only one "natural bed" has been made a face? The other is a joint, and consequently not exposed.

The south, in my experience, has always been the exposed side for stone.—I am, &c.,

JOHN FERGUSON.

SIR,—The case of the stone in St. Jude's Church, Southsea, as reported by Mr. T. Gilbert Stevenson, LL.D., in your issue of to-day's date, surely differs from those mentioned in yours of 22nd ult.

As I take it, the stones in the Langham-place Church are *both* on their wrong bed, one showing signs of decay, the other not. The reason for this peculiar action of the weather on one, while the other escapes, has yet to be given. But in the case of the Southsea stone the reason is not far to seek, seeing that the side which shows no sign of decay is *end grain* to the weather, and will (unless enough weight come upon it to split it) show none for some time yet. Though a stone is not as strong so

laced (being to one placed as in the quarry s ¢ : 1), yet Dr. T. G. Stevenson should be, and o doubt is, aware that the practice of putting hem end-on to the weather is often resorted to n the case of cornices with deeply undercut nouldings, and when so placed show no more igns of weathering badly than those beside hem placed with strata horizontally.—I m, &c.,

Portsea, Aug. 5. VECTIS.

SIR,—I am surprised at Mr. Stevenson's etter on this subject in your issue of the 5th nst. To me there does not seem to be anything extraordinary in the example he quotes.

There are two ways to set a stone—(1) "tooth ut," or on its natural bed, which is the correct ray; or "bed out." When a stone of which wo faces (an end and side) are seen is set in he latter manner, one side (the west, in your orrespondent's case) must be "tooth out," lthough it is at the same time laid on edge.

When a stone decays from the above-named ause, it is invariably on the side of the natural ed (the south side in the example under dis-ussion).—I am, &c., SALTARIES.

ARCHÆOLOGICAL SOCIETIES AND THEIR USELESSNESS.

SIR,—I can truly sympathise with Mr. ands in the difficulty he labours under in not eceiving the right stand of fellowship from he learned societies in Scotland, to further his esearch in studying Scottish archæology; but uch is unfortunately the case from my ex-eriences as a Scotchman.

I would advise Mr. Sands, however, to consult Rev. Dr. Gordon, of St. Andrew's Episcopal Church, Glasgow, in whom he would find a friend and scholar in Scottish archæology.—I m, &c., J. REID.

Late Student of Royal Institution and College of Arts, Edinburgh.

8, Berners-street, London, W.

BY ORDER OF THE CHURCHWARDENS.

SIR,—May I call your attention to the fact hat sketching in St. Bartholomew the Great s now only allowed, by order of the church-vardens, on payment of a "moderate charge f from 5s. to a guinea," to be paid by the ap-licant "in the form of a subscription," commensurate with the position of the ap-licant"?

London students of architecture are not so well off for subjects to sketch that they can afford to have such national memorials taken from them without expostulating, and I think it is very hard on us that such rules should be imposed by churchwardens just because a fine specimen of architecture happens to be in a poor parish.—I am, &c.,

STUDENT.

THE NUISANCE FROM SEWER VENTILATORS.

SIR,—Mr. Buchan, on page 230, has denied my statement, without giving any proof that his denial is correct. To prevent wasting your space in writing *what we think*, will Mr. Buchan say what additional pressure per square foot could be obtained by adding 10ft. of extra pipe to shaft and fixing *any ventilator* on the top, as he suggests?

Also, what is the motive power that causes air to flow up shafts when the inlets and outlets are at different levels? If it is not the difference in the height of air as registered by the barometer and thermometer, what is it?

If additional lifting power is gained by any other source, give proof of it.—I am, &c.,

R. H. REEVES.

Cedardale, Putney, August 9th.

A WONDERFUL FALL.

SIR,—In your current issue you quote in a paragraph a wonderful fall of a man from a chimney shaft of over 70ft. I do not know whether it may interest your readers to know that a foreman in the employ of Messrs. Howell and Son, of Bristol and London, when they were building the new Wesleyan chapel, fell from the spire, a height of 25ft. In his fall he broke a scaffold pole which measured 6in. through, and also went through a board-and-felt roof of the engine shed. He is now quite well, and apparently none the worse for his flight through the air. I am not writing this for the sake of competition, but for the sake of those who may intend to equal the feat.—I am, &c.,

JOSEPH WHITE.

Lincoln-avenue, Bournemouth, Aug. 6.

Intercommunication.

QUESTIONS.

[9363.]—**Alphabets.**—Can any reader kindly recommend me a suitable work upon alphabets for letter-cutting on monumental work, and oblige?—APPRENTICE.

[9364.]—**Main Drainage.**—What are considered to be the best textbooks on this subject in relation to the sewerage of towns of, say, 10,000 inhabitants and upwards?—SANITAS.

[9365.]—**Adjustable W.C.s.**—Should be pleased if any of your readers could recommend a form of seat to be used by adults, and at the same time to have some convenient mechanical arrangement so as to enable the seat to be adjusted for the use of infants.—T.

[9366.]—**Cement on Tiles.**—Will any of your correspondents kindly inform me how I can best remove from some encaustic tiles I have recently taken up the cement adhering to the sides, in order that they may be relaid? I have tried soaking them in water, but this appears to have no effect.—W. C. HAYES.

LEGAL INTELLIGENCE.

IN RE ESDAILE AND PEATY.—The bankrupts, who had traded as machine sawyers and timber merchants, in Nicholas-lane and Wenlock-road, under the firm of Esdaile and Co., applied to Mr. Registrar Brougham on Friday for their discharge. They filed their petition in January last, and their accounts showed joint liabilities amounting to £38,932, and assets estimated at £10,446. The Official Receiver reported that the business was originally established about 1810, and the bankrupts joined the firm without introducing capital. They stated that the business was profitable down to 1878, but that in the following years the trading profits were swallowed up by the payment of heavy interest, annuities to partners, and bad debts, the result being that in 1884 there was a deficiency shown of about £16,000. The Official Receiver submitted that the financial position of the firm was not sufficiently disclosed by the books since June, 1884, although they contained the materials from which the same could with some clerical labour be ascertained. The failure was attributed in a great measure to the decadence of the veneer and other branches of the mill trades which had set in prior to 1884. The Official Receiver was, however, of opinion that if the bankrupts had looked sufficiently into their affairs and made due allowance for bad debts and other losses it would have necessitated their stopping at an earlier period. The Registrar granted a discharge subject to a suspension for six months.

EAST AND WEST INDIA DOCKS COMPANY V. KIRK AND OTHERS.—(Before the Lord Chancellor and Lords Watson, Bramwell, Fitzgerald, and Macnaghten).—This was an appeal to the House of Lords from an order of the Court of Appeal affirming a judgment of the Divisional Court. It appeared that Messrs. Kirk and Randall, contractors, had, in June, 1882, entered into a contract to construct new docks at Tilbury, which involved a vast amount of excavation. The soil turned out to be different from what was expected, and the cost of executing the works was enormously increased. The sum now in question was said to amount to £335,000. A dispute having subsequently arisen between the parties, the matter was referred to an arbitrator, Sir Frederick Bramwell, who decided that as the excavating work under the contract had turned out to be wholly different from that for which the schedule of prices had been agreed upon, he had power to say what was the proper price to be allowed for it. An application was made to the Divisional Court to revoke the submission to arbitration on the ground that the arbitrator had received evidence which was not admissible, and had exceeded his jurisdiction; but the application was refused, and that decision was upheld by the Court of Appeal. The Lord Chancellor said their lordships were of opinion that the arbitrator should state, as part and on the face of his award, all the purposes for which he had received, and the effect of any which he had given, to five different classes of evidence specified in the paper handed in by Sir Henry James. If, therefore, before Tuesday morning Messrs. Kirk and Randall consented to an order being made to that effect, the rule would be discharged, without costs on either side. If such consent were not given within the above time, the rule for leave to revoke the submissions to arbitration herein would be made absolute. The Lord Chancellor announced on Tuesday that there had been forwarded to him the consent of Messrs. Kirk and Randall to the course proposed. The rule would be discharged without costs on either side.

IN RE ROBERT A. AND J. STEWART.—(Sittings in Bankruptcy, August 9, before Mr. Registrar Linklater.)—The debtors, who were timber merchants carrying on business in Fenn-court, City, as Stewart Brothers, and at St. John and Bathurst, New Brunswick, as R. and J. Stewart, applied to pass their examination. The statement of the joint affairs showed liabilities £389,817, of which £158,102 were entitled to rank against the estate, with assets estimated to realise £119,977. Mr. R. A. Stewart, the senior partner, who has arrived in this country from Canada, was examined, and stated that he was prepared to swear to the accuracy of the statements filed by his partner. The failure was attributable to losses on the trading during the last two years. A surplus of £46,400 had been lost, and there was a deficiency of £138,000. The debtors passed their examination.

EMPLOYERS' LIABILITY ACT.—On Friday, before a jury at the Clerkenwell County Court, a trial was concluded, in which Samuel Fairall, a carpenter, sued the American Exhibition Company, West Brompton, for damages for personal injuries sustained while in the employment of the defendants. The evidence for plaintiff was that on March 27 he was working with a number of other men constructing a bridge between the American Exhibition and Buffalo Bill's show. The work had to be done on a Sunday and at night, so as not to interfere with the traffic on the Metropolitan District Railway, whose line the bridge spanned. The plaintiff was acting under the orders of the two head carpenters of the defendants (Wingate and Evans). While standing upon the end of a 12in. plank he was struck by a beam which swerved on being hoisted, thrown on to the railway metals beneath, and received such injuries as to incapacitate him from further work as a carpenter. The defence was (1) that the plaintiff jumped off the plank; and (2) that he had received £5 in settlement of all claims he might have upon the defendants. The plaintiff alleged that the receipt for this £5 was obtained from him by a device. For defendants it was argued that the plaintiff could not claim, because, under the Lord's Day Observance Act, no contract to work on Sunday was valid. The Judge overruled this objection, and the jury gave the plaintiff £300 damages and costs.

GRINDING MONEY.—At the Hampstead Petty Sessions on Wednesday, Messrs. M'Cormick and Sons, builders, of Redington-road, Hampstead, were summoned by George Kirby, carpenter, for 1s. 6d. for two hours' "grinding money." Complainant deposed that he was a non-society man, and was in the employ of the defendants as a carpenter at 9d. an hour for ten days up to and including July 28. No complaint was made to him until that day, when at forty-five minutes past five p.m. defendants' foreman gave him notice that he should not require him after half-past six p.m. that night. He worked till half-past six, and was paid up to that time, but the foreman refused to pay him "grinding money." It had been the custon of the trade for twenty years to allow "grinding money," and he produced a copy of the rules upon the subject, agreed upon between the men and the Masters' Association. Charles Cross, builder, of Allcroft-road, Kentish Town, gave evidence that it was the custom of the trade to allow two hours' "grinding money" alike to society and non-society men. Defendant said his firm did not recognise these rules. They did not employ society people. These rules were made during a strike in the trade when they did not stop their works. All they did was to give a man one hour's notice; but if he was a good workman, and had done them justice, they did not object to pay "grinding money." Thomas Morgan, defendant's foreman, having given evidence, the Bench ordered payment of the 1s. 6d. claimed, with 12s. costs.

IN RE J. B. AXFORD.—The bankrupt, who was a builder carrying on business in Henry-street, Gray's Inn-road, and at Crouch-hill, applied for an order of discharge. The receiving order was made in March last, the liabilities being given at £3,546, and the trustee certified that the assets had produced the sum of £1,641. The bankrupt commenced business about 20 years since, and in 1874 he presented a petition for liquidation, and paid a composition of 5s. in the pound on liabilities amounting to £7,004. Again in 1879 he presented a petition when they amounted to £7,986, and a composition of 5s. in the pound was paid. He attributed his present failure mainly to losses on contracts, stated in the deficiency account at £1,100, and to depreciation in the value of plant and effects £1,025. The Official Receiver reported that the books did not sufficiently disclose the bankrupt's financial position from time to time, and the bankrupt stated in his examination that he took stock once only—namely, about three or four years before his present failure, and from that time he did not know how he was going on. Mr. Registrar Linklater on Wednesday suspended the bankrupt's order of discharge for twelve months.

Messrs. William Ramsey, jun., and Co., Argyll-street, Glasgow, have been awarded the gasfittings contract for the new municipal buildings, Glasgow. The contract is probably the largest of the kind ever yet placed in Scotland, as over eleven miles of piping will require to be laid.

WATER SUPPLY AND SANITARY MATTERS.

Deodorisation Works at the Metropolitan Sewage Outfalls.—In consequence of increasing complaints relative to the condition of the Thames, Sir Joseph Bazalgette, engineer of the Metropolitan Board of Works, has prepared a report upon the remedial works now in progress. It states that the process of precipitation experimentally tried at the sewage outfall for South London at Crossness will be put into full operation at the northern outfall, near Barking Creek, in August, 1888; Messrs. Mowlem and Co., contractors, having, in February last, undertaken the works for £406,000, and agreed, subject to a penalty of £300 per week, to complete them in eighteen months. The works consist of precipitation reservoirs or tanks, sludge-settling channels, engine and boiler houses, superintendent's house, and twelve workmen's cottages, pier and jetty for shipping the sludge, &c. There will be thirteeen precipitating tanks, into which the sewage will be conveyed in succession, and allowed to remain quiescent until the solids are deposited, when the effluent water will be run off into the river if the tide is favourable, or into the existing reservoir until the tide permits. The sludge will then be conducted into settling tanks and more of the liquid removed, to be mixed with lime-water to form the precipitating agent for future use, and the settled sludge will then pass through pipes to the pier-head, falling into ships and being carried away to sea. The works already executed are valued at £54,000, and the men now employed upon them number 1,500.

Hamilton Water Supply.—The Town Council of Hamiltcn, N.B., met on Thursday, the 4th inst., to consider reports submitted by Mr. W. R. Copland, C.E., to whom the question of the extension of the present waterworks had been referred, recommending the raising of the reservoir embankment 6ft., which, at an outlay of £3,800, would give additional storage capacity for 25,000,000 gallons of water. As an alternative scheme, he recommended the construction of a reservoir on Kype Water, Avondale, to be connected with the present works by means of a conduit. At an outlay of £22,000 it would afford a supply of 70,000,000 gallons; but Parliamentary powers would be required. The committee recommended that the heightening of the embankment of the reservoir be at once proceeded with.—The report was adopted.

Peterhead, N.B.—At a meeting of the Peterhead Police Commissioners on Monday a scheme for a new water supply was submitted. This is rendered necessary in consequence of the present supply having to be given to the harbour of refuge works and the convict prison. Messrs. Leslie and Reid, Edinburgh, submitted a report proposing to take water from the South Ugie, near Mill of Fedderat, some sixteen miles distant from Peterhead, at a level of about 285ft. The pipes would be laid alongside of the public road to Richmond, where there would be a reservoir at a level of 150ft. A main of 8in. diameter would deliver 300,000gals. in 24 hours. The cost of the scheme would be, for an 8in. main, £17,500; for a 9in. main, £19,000; and for a 12in. main £27,150, and the last would give 800,000gals. in 24 hours. The Commissioners remitted the report to the Water Committee for further consideration.

St. Helen's Water Supply.—At the meeting of the St. Helen's Town Council, held on the 3rd inst., the tender of R. Daglish and Co., of St. Helen's, was accepted for the erection of a compound rotative beam pumping engine, with boilers, pumps, &c. The engine is to be erected at their Kirkby pumping station. The works there consist of two 11ft. wells 150ft. deep, and a 24in. and 18in. bore-hole, which is at present a depth of 400ft. from the surface of the ground. The yield at this depth is so large that the whole of the plant of the well contractor (Mr. J. Villiers, of Beverley), pumping at the rate of 2,100,000 gallons per 24 hours, is unable to reduce the column of water in the well under 105ft.; there can scarcely be any doubt that the yield at present is at least from 3 to 3½ million gallons per 24 hours. The strata in which the work is being carried on is that of the pebble beds of the new red sandstone, and it is proposed to continue the boring to a depth of 500ft. from the surface. The engineer for the works is Mr. D. M. F. Gaskin, M.Inst.C.E., water engineer to the corporation.

Stafford Waterworks.—The town council of Stafford have met with an unexpected check in obtaining a supply from their deep boring on Enson Moor. As the boring proceeded to a depth of 900ft. the quantity of water gradually increased so as to yield 500,000 gallons per day of good water. Upon going a few feet deeper the quantity of water suddenly increased to nearly double the former yield, but on examination it was found that it was impregnated with salt. Inasmuch as the salt measures in the upper strata had been effectually excluded, the discovery of water being impregnated with salt at a depth of 900ft. occasioned the greatest surprise. The boring had been made through 430ft. of sandstone, and all geologists and engineers who had been consulted were of opinion that when the Bunter beds of the sandstone were reached an abundant supply of excellent water would be obtained for Stafford, as at other places, from the Bunter sandstone. The committee at once decided to consult Mr. de Rance, of the Geological Survey Department, before whom the matter was brought by the Local Government Board many months since, and he reports that the salt now met with in the lowest strata can easily be dealt with.

PARLIAMENTARY NOTES.

Northern Outfall Sewer.—Colonel Makins last week asked the Secretary of State for the Home Department whether it was true that the sluices of the northern outfall sewer had been opened daily from the 11th to the 28th of July inclusive for two or three hours before the tide turned; whether the effect of such premature opening of the sluices was that the sewage was sent up the stream and polluted the water at Woolwich and other places higher up; whether such pollution had caused much complaint as being dangerous to the health of the residents; and whether he would take steps to induce the Metropolitan Board of Works to discontinue the practice of opening the sluices before high water. Mr. Matthews: Yes, Sir, it is a fact that these sluices are being opened before the tide ceases to flow, and that accordingly a certain quantity of sewage goes up the river, thus causing much complaint. I am informed by the Metropolitan Board of Works that extensive works are being carried on at the northern outfall for the purpose of purifying the sewage, and in order to carry on this work with safety it is necessary to keep one of the four compartments of the reservoir empty, and to maintain the sewage in the other three compartments at a lower level. The reservoir space being thus restricted the sluices have for the present to be opened before the tide has ceased to flow. I am assured that the works are being actively pressed forward in order that the necessity for thus opening the sluices may terminate as soon as possible. I regret, on behalf of the inhabitants of the bank, that the necessity entailing such consequences should have arisen.

Compensation for Messrs. Leeming and Leeming.—Included in the Supplementary Estimate in connection with the Civil Services and Revenue Departments, issued on Monday, appears the item of £8,000 to Messrs. Leeming and Leeming "in full satisfaction of their claims upon Her Majesty's Government in connection with the preparations of plans for the erection of new offices for the Admiralty and War Departments."

The Salary of the Receiver of Crown Rents.—Mr. Molloy called attention on Monday to the sums paid to Mr. Clutton for the collection of Crown rents. As receiver of Crown rents, Mr. Clutton was paid £5 per cent., by which he obtained as much as £8,000 to £9,000 a year, whereas the whole of the work could be performed by an intelligent clerk at £200 or £300 a year. In addition to these emoluments Mr. Clutton was paid considerable sums for work done for the Ecclesiastical Commissioners, which never appeared in the votes at all. Mr. Jackson explained that the estates which Mr. Clutton managed represented 52,500 acres of land, scattered over 18 counties, many of them situated at a considerable distance from each other. They represented something like 1,850 holdings, exclusive of garden allotments and manorial tenants. It was Mr. Clutton's duty to visit the estates several times a year, and to advise as to the drainage and the management of the estates generally. For this service Mr. Clutton received a commission of 4 per cent. The rental on which Mr. Clutton received a commission amounted to about £80,000 a year. The hon. member spoke as though this commission was all net money to Mr. Clutton, whereas that gentleman, in order to discharge the duties which devolved upon him, had to keep up a large establishment and to employ a considerable number of clerks. Mr. Beadel said he had an intimate knowledge of Mr. Clutton's business, which rendered it necessary to keep a very superior staff of clerks. Mr. Jackson explained that when new buildings were erected Mr. Clutton received a fee for making the plans and superintending the progress of the works. Mr. Conybeare inquired whether it was not possible to get the work done for considerably less than £6,000 a year. Mr. Isaacs said the surveyor to the Woods and Forests had to maintain a very large establishment. He had to keep in his employment between 30 and 40 clerks, whose salaries were paid out of the £6,000. On a division, a motion to reduce the vote by £5,000 was rejected by 150 votes to 78.

The name of the architect appearing in connection with tenders for new Wesleyan Sunday-school, Newbury, last week was not Ball, but Bell.

Our Office Table.

We regret to announce the death of Mr. John Roddis, of Aston, which took place at his residence, at Aston-road North, on Wednesday week. Mr. Roddis was 48 years of age, and had been in a hopeless state of health for some months. It is stated that Mr. Roddis, whose work as a sculptor was largely in connection with church decoration, suffered considerable pecuniary loss in consequence of the ardour of his attachment to Liberal principles and his enthusiasm in their advocacy. The whole of the carving on the exterior of the Birmingham Art Gallery, with the exception of the pavement, was the work of Mr. Roddis. Much of the carving in the Goulburn Cathedral in South Australia is his, and at the time of his death he was executing a commission for the Christchurch Cathedral in New Zealand. He was the sculptor of the reredos in Wretham-road Church, of the carving in St. Augustine's Church, Edgbaston, and of the pulpit and font in St. Martin's. There are many other churches in Birmingham which are decorated with Mr. Roddis's work. Mr. Roddis executed the St. Augustine memorial erected by Lord Granville in the Isle of Thanet. Among the many monuments which were executed by him was the Earl of Derby's tomb at Knowsley. Mr. Roddis was one of the founders of the Midland Arts Club, and was its president in 1885. He was an occasional contributor to our own columns.

The firm of Wilcock and Co., Burmantofts, Leeds, manufacturers of faïence, pottery, glazed bricks, terracotta, &c., has been reconstituted under the Companies Acts, and will in future be carried on as Wilcock and Co., Limited. The share capital of the company is £100,000, and the debenture capital £50,000. Those interested in the business have taken up the whole of the present issue of share capital, and no shares will be issued to the public. The business, as heretofore, will be under the direction and management of Mr. Jas. Holroyd, and the other directors are Mr. Thos. Holroyd, Mr. E. E. Holroyd, and Mr. J. H. Hustler. As there is no break in the management of the business, no doubt that in the future, as in the past, the specialties of the firm will maintain the high artistic and technical excellence for which they deservedly have so high a reputation. Mr. Holroyd may be congratulated on the success which has so far attended his spirited efforts to establish and develop a higher standard of excellence in ceramic productions, making them not only utilitarian and practical, as they undoubtedly are, but also applicable to the highest and widest artistic expression of form and colour. No one has worked harder at this ideal than Mr. Holroyd, and it must be a satisfaction to him to know that his efforts are appreciated by the profession and by those of the public who understand that artistic expression and decoration does not consist in elaboration of ornament or a complication of "pretty colours," two common faults which have done much to condemn ceramic decoration as often carried out, and from which the Burmantofts productions are conspicuously free.

Two months ago we referred to the extraordinary decision made by the local board of Ventnor, to give the whole of their officers three months' notice to terminate their engagements, reduce the wages of all workmen and labourers by some shillings a week, and suspend the flushing of the sewers. They followed this so-called economy up by offering the offices to the clerk at £20 less per annum and the surveyor at £50 less; but the latter officer, Mr. R. S. Scott, who had served the board faithfully for eight years, obtained a better engagement at Bishop Stortford out of 114 candidates. The board then advertised the surveyorship, offering no less than £75 a-year—nearly 30s. a week—as salary, and obtained several replies. Three of the candidates were invited to come down to Ventnor, payment of expenses being promised, and a local man was also included in the short leet, and the four duly appeared before the board. The selected candidates were Mr. Robert Coates, Birmingham; Mr. Thomas C. Softhouse, Stroud; Mr. C. J. Howe, Barnstaple; Mr. G. E. Horton, Birmingham; and Mr. E. J. Harvey, Ventnor. As might have been anticipated, the local candi-

e was elected by a majority of 7 to 3, and the nywise members of the board then had the sfaction of voting from the money they re scrimpingly saved the ratepayers £15 as velling expenses to the gentlemen they had dlessly brought down for a few hours at the side from Birmingham, Stroud, and Barnple. It is unfortunate that the economists not be personally saddled with the money s thrown away.

THE tenth congress of the Sanitary Institute l be held at Bolton from the 20th to the 24th next month, under the presidency of Lord ing, better known as Mr. Sclater-Booth, sident of the Local Government Board in six years of the Beaconsfield Administra-. The Congress is divided into three tions—viz., Section I., Sanitary Science and ventive Medicine; Section II., Engineering Architecture; Section III., Chemistry, teorology, and Geology. Each section comnces on a separate day. The inaugural ress will be given by the president at the bert Hall at 8 p.m. on the first day, Tuesday, 20th inst., and on the following day the tings of the first section will be held in the wn Hall, being opened at 10.30 by an address Professor J. Russell Reynolds, F.R.S., the ers and discussions being continued on the lowing day. On Tuesday, the 22nd, Proor T. Hayter Lewis, F.S.A., will open the nd section with an address, and papers to followed by discussions will be read on ious subjects connected with engineering architecture on that and the following day. third section will meet on Friday, Dr. gust Dupré, F.R.S., in the chair; and on urday addresses will be delivered to the rking classes in the Albert Hall by Major nrock Flower, Dr. A. Wynter Blyth, and Henry Law, M.Inst.C.E. A health exhibiwill be held in connection with the conss in the Drill Hall, Silverwell-street, and l remain open from September 20 to ober 15.

THE Right Hon. Sir W. H. Gregory writes ngly protesting against the utter neglect the National Portrait Gallery by the vernment. This invaluable collection of traits was avowedly temporarily removed to hnal Green Museum from the sheds at South nsington until a new and safe permanent lding could be provided for them; but no ps have thus far been taken towards housing m in a safe gallery. The portraits are not preciated by visitors to Bethnal Green seum, which does not even afford them quate protection from snow and rain, and, Sir William points out the plea for delay on ground of economy is not now available, as re is no costly public building in progress present. The new Admiralty and War Office ns have been rejected; the National Gal- is finished. "It is not," he justly remarks, onomy to leave public buildings during a g period unfinished and unsightly, and to d into banishment and to a place where they ig unappreciated these national portraits lected with such unremitting care and outg. It would be just as rational and more nomical to lock them up in chests and osit them in some fireproof establishment. re would then be room at Bethnal-green for more popular exhibition of works of art." ing his long experience as a member of liament, Sir W. H. Gregory never remembers utcry being raised against the erection of lic buildings which were shown to be essary, although the House has expressed pproval of sites and of crude unsatisfactory hs. He doubts, indeed, whether a Governnt is likely to gain popularity or respect by ble parsimony.

THE report of the City and Guilds of London titute for the Advancement of Technical cation states that the ninth annual examions in technology were held in May and ne. A special feature of this year's examion is that 48 candidates were examined in e subjects, under the direction of the Inute, in New South Wales. Examinations e held in Sydney, Bathurst, and Newcastle. question papers were sent out to Sydney, the answers of these colonial candidates e forwarded to London, where they were mined, together with those of other candis, the date of the examination having been imed as to render the arrangement possible. The increase in the total number of candidates examined and of those who have passed is satisfactory. In 1886, 4,764 candidates were examined, of whom 2,627 passed; in 1887, 5,508 were examined, of whom 3,090 passed. The increase in the number of candidates in 1887 is 744, as against 796 in 1886. The chief increase was seen in the engineering and textile trades, plumbers' work, and carriage building. Mr. John Slater, in his report as Examiner in Brickwork and Masonry, states that the general average of the papers shows a decided improvement; and in the class of Mechanical Engineering Professor Hele-Shaw speaks in similar terms, while as to tools Mr. J. J. Holtzapffel says that the papers are superior to any hitherto sent in, and the drawings in some are to be commended.

A SMALL selection from the antiquities found by M. Naville when working for the Egypt Exploration Committee at Tel Basta, the site of Bubastis, and Tel-el-Yahudiyeh, the city of Onias, is now on view in the rooms of the Archæological Institute, Oxford Mansions, W. The exhibition will be open to subscribers to the fund and to members of the Institute and their friends on presentation of card, each Monday, Wednesday, and Friday, for the next fortnight. The exhibits in the collection on view include objects in porcelain and bronze, scarabs, sacred cats, and the like; a Canopic vase of a priest of Bast; a sculptured group fragment of a statue of Haker, a king of the 29th Egyptian dynasty, who was defeated by Artaxerxes, B.C. 393; all from Tel Basta. From Tel-el-Yahudiyeh, besides rosettes and tiles of well-known type, there are beads, objects in glass and porcelain, flint implements, scarabs, pottery, and some curious coffin heads of terracotta. Various prototypes of Greek pottery from Tel-el-Yahudiyeh, such as amphoræ, food-vessels, and bottles, are also shown.

ONE of the more generally interesting papers read before the British Medical Association at their Dublin meeting was that by Dr. Charles Moore Jessop on "Ancient Dress Compared with Modern in Relation to Disease." He remarked that the use of the "strophium," or broad breastband, by Roman ladies, the precursor of stays, introduced by the Normans, was condemned by writers in the Middle Ages as "a custom fertile in diseases and death," and stays were designated "whalebone prisons." In the time of the Georges, the evil effect of high-heeled shoes was altering the centre of gravity, which increased the strain upon the muscles, which could not without fatigue maintain the body erect, thus gradually reverting to the habit of tailless apes who walk on their toes. The fault of the present system was unequal distribution of clothing. The shoulders were the portion of the body to bear weight, and not the hips. The influence of stays on pulmonary diseases was not well made out; still, as there was a decrease of vital capacity, the way was paved for the inception of more serious disease. But of more consequence was the limitation of the heart's action. He showed its injurious effects also upon the liver, and its tendency to promote other diseases. By wearing stays the girl was not placed in the most favourable condition for maintaining healthy life. Much good would result, he thought, by adopting with modification the ancient dress, and the advantages would be most marked in the case of the working classes.

THE award of prizes and scholarships in connection with the permanent Educational Institution of the Crystal Palace (for ladies) has just been completed. The Committee of Artists, Mr. J. B. Burgess, A.R.A., and Mr. J. Seymour Lucas, A.R.A., bestow the silver medal for painting in oils on Miss Rosa Tapp, of Shortlands, and the certificate on Miss Frances Stevens, of Beckenham, both Mr. Goodall's pupils; as was also Miss Florence Wilson, of Alford, Lincolnshire, who took the certificate for painting (landscape) in water-colours. Miss Harriett M. Bennett, of Forest-hill, gained the silver medal for painting in water-colours from the living model, and her sister Miss Kate Bennett, the certificate, both pupils of Mr. John Parker, R.W.S. The medal for drawing from the life was adjudged to Miss Mary Leveson, of Anerley, and the certificate for drawing from the antique to Miss Ilma Chadwick, of Sydenham, both pupils of Mr. Wensley Russell. The judges awarded the scholarship in art to Miss Kate Bennett.

A MEETING of the Darlaston Local Board was held on Friday for the purpose of accepting one of the thirteen tenders sent in for the erection of the Public Buildings. The lowest tender of all was not dealt with, and the two before the meeting for choice were Mr. J. Guest, Brettle-lane, £5,268 7s. 4d., and Mr. T. Tildesley, Willenhall, £5,296. Ultimately the latter was accepted. £2,046 was in respect of the Town Hall, and £3,250 in respect of the public offices, free library, caretaker's house, and boundary walls. The *Staffordshire Advertiser* remarks that "the tenders furnish a striking proof both of the accuracy of the architect's estimate of cost and of the closeness with which the matter has been gone into by the competing builders. Mr. Cossins' estimate was that the cost would not exceed £5,500, and out of 13 tenders sent in seven were below the amount, the figures ranging from £5,235 to £5,474, and six were above it. One of these was wide of the mark—viz, £6,301 (more than £1,000 above the three lowest), and the other five ranged from £5,559 to £5,844. The difference between the highest and lowest of the 12 was, therefore, only £609."

A COLLECTION of Babylonian antiquities of considerable interest is at the present time in the hands of a private collector in this country. The collection, says the *Times*, consists of a series of about 300 inscribed terracotta tablets relating to the revenues and tithes of one of the most ancient of the Babylonian temples. In 1880, Mr. Hormuzd Rassam, when engaged on the works of exploration in Babylonia on behalf of the trustees of the British Museum, discovered, about thirty miles from Bagdad, the site of the ancient city of Sippara, one of the chief centres of the religious life of Chaldea, in which was a great temple dedicated to the Sun-god. On the return of Mr. Rassam to England, native overseers were retained on the site for a short time, but were last year removed. No sooner were these men withdrawn than Arab antiquity-hunters from Bagdad commenced their irregular diggings on the site, and the collection which has just reached this country was thus obtained. The majority of the tablets relate to the collection of the revenues of the temple, which were derived from tithes and dues imposed on corn and dates, as well as contributions from pious donors. The new collection of tablets affords very clear indications of the wealth of the land of Chaldea in the seventh and sixth centuries before the Christian era. The names of the payers are entered in full, and sometimes the name of the father and the trade are given. The amount is entered in ruled columns, and separate payments in other columns, the total being given at the foot, and the whole sometimes countersigned by witnesses. Some of these tablets are of great historical value as connecting links in the chain of documents on which Babylonian and Assyrian chronology are based, for every one of them is dated in the month, day, and regnal year of the king's reign when the transaction took place.

The Rev. J. F. Kitto, in a further letter on the proposal to set back the steps of St. Martin-in-the-Fields Church, urges that the discussion has shown that no necessity can be shown to exist on the ground of public convenience, so far as the present is concerned, and that if anything is needed to be done the improvement can wait until the National Gallery is dealt with. If, however, it is thought that something ought to be done at once, he suggests that by carrying down the steps in one continuous flight on the east, on St. Martin's side, and by the sacrifice of the unused steps on the National Gallery side, as much space will be gained as by the alteration which the Board proposes. It seems to Mr. Kitto, therefore, that it would be impossible, until a very much stronger case had been made out, for the vicar and churchwardens to give their approval to the present proposal.

A substantial improvement is being made to the external appearance of St. Silas' Church, Lozells, Birmingham, an edifice erected in 1852, by the rebuilding of the boundary wall and the addition of porches. Mr. C. J. Dunn, of Birmingham, is the architect for the work, of which a memorial stone was laid on Monday.

Herr Heinrich Hartmann, architect, formerly of Bremer, died on Tuesday at his residence, Bremer Lodge, Blackheath Park, S.E., aged 73.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Architectural Association. Visit to the seat of Mr. B. W. Currie, near Farnborough, the late Mr. G. Devey, and Mr. Jas. Williams, architects.

CHIPS.

Two memorial-stones of a new Wesleyan chapel were laid at Queensbury, near Halifax, on Saturday. The building is being erected from the designs of Messrs. Utley and Grey, of Halifax, at the cost of £1,200.

The memorial-stone of the new building for the Ladies' College in Jersey was laid at Rouge Bouillon last week. It will contain on ground floor a dining hall and assembly room, together 100ft. in length, and capable of being thrown into one, and classrooms; and on the first floor are sitting rooms and bedrooms, with thirty cubicles for boarders in the second story. Mr. Curry, of Halkett-place, Jersey, is the architect, and the contractors are Messrs. Cuzner, Woodsford, and Harris. The cost will be £5,000.

At present workmen are busy putting a new roof on the transept of the Abbey Church at Hexham, and an axe, probably of the 15th century, has been found in one of the gutters of the roof of the north transept. The handle, which is of iron, has a crook at the end, while the head has been welded into the handle. The Scots under Sir William Wallace in 1296 destroyed the nave of the church and some of the monastic buildings, and left the transepts roofless. They remained some two centuries in that condition, until Prior Leschman in the 15th century repaired the buildings and put on new roofs, and it is believed that this axe had been left where found by a workman engaged in that work.

The completion of Sir John Coode's scheme for the protection of the foreshore at Hastings by means of two stone groynes and an extended breastwork at the east end of the town, was celebrated on Wednesday. The acting mayor laid the final stone, and so practically ended the undertaking. The total cost of the work thus terminated has been some £30,000. The total length of the breastwork and larger groyne is close upon 1,000ft. The beneficial effect of the new structure is already, it is said, being realised. Sir John Coode remarked that the beach was accumulating at the rate of some 40,000 to 50,000 tons per annum.

At a meeting on Tuesday of the Aberdeen Royal Infirmary directors, it was reported that Messrs. Snell and Son and Messrs. Smith and Kelly, the architects, were making steady progress with the plans of the hospital extension.

A correspondent complains that permission to sketch in the recently-restored church of St. Bartholomew, Smithfield, is refused by the churchwardens except on payment to the restoration fund of the prohibitory charge of one guinea by each sketcher. The churchwardens have written, admitting that they have agreed to make "a modest charge, commensurate with the position of the applicant and in the form of a subscription to our funds, to persons desirous of sketching," the moderate charge being given, it seems, a range of from five shillings to a guinea, according to the apparent squeezability of the would-be sketcher.

Memorial stones of a new Baptist schoolroom were laid at Orpington, Kent, last week. The building is being erected at a cost of £1,000, from plans by Mr. G. St. Pierre Harris, of London and Orpington. Mr. Knight is the contractor.

A memorial stone was laid at North Mymms, Herts, on Monday week, of a new Church boys' school. Mr. John Bates, of Walham-green, was the architect, and Mr. J. Curnow the contractor.

Holy Trinity Church, Southampton, was re-opened on the 4th inst., after having been redecorated and renovated internally—a work carried out by Mr. C. Vaughan, of that town.

The Teddington Local Board have accepted a tender for the construction of a bridge over the river Thames within their district, and it is expected that the work will be proceeded with immediately. The sanction of the Thames Conservators has been obtained to the erection of a bridge, and the plans have been approved by the Local Government Board.

A new highway bridge is in course of construction at Thurso, for the Police Commissioners of that town. Messrs. Gordon and McBey are the engineers, and the cost will be about £4,000.

The foundation-stone of the new parish church of St. Mary, Kingston, Portsmouth, was laid by the Crown Princess of Germany, on Tuesday. The new fabric, of which Mr. A. W. Blomfield is the architect, will occupy the site of the old church of St. Mary's. The total expenditure will not fall short of £40,000, of which three-fourths are in hand.

Trade News.

WAGES MOVEMENTS.

EDINBURGH JOINERS.—A largely-attended meeting of the Edinburgh joiner trade was held on Monday night in the Good Templar Hall Buildings, High-street, "to hear employers' reply to circular of 13th July, and decide as to further action." At a recent meeting the men resolved to request from the employers an advance of ½d. per hour on the present rate of wages, which is 6½d. an hour. Some of the employers were favourable to granting the advance; others would do so if the movement were general. The following motion was unanimously agreed to:—"That this meeting, having heard with satisfaction a favourable reply from a number of employers, resolves to push the demand, and to request an immediate answer from those who have not already replied." It was further resolved "that said increase should come into force on Friday, the 12th curt." It is expected that an amicable settlement will be made.

The Free Church at Newington, Edinburgh, is about to be restored and renovated from plans by Messrs. Shiells and Thomson, of George-street, Edinburgh. The works will include re-seating, reglazing, and decoration.

At the half-yearly meeting of the Forth Bridge Railway Company, held in Edinbugh on Tuesday, the report stated that the piers and girders of the north and south viaducts were completed, and that at South Queensferry and Fife the steel columns, with their connections and bracing had been carried to their full height of 370ft., while at Inchgarvie, the columns were up 283ft. above the ea level.

The guardians of the Strand Union were informed on Tuesday that the Duke of Bedford, being about to carry out important improvements at the Fruit Market, Covent-garden, would require the Board's offices on the side of Bow-street adjoining the Floral Hall, for the purpose of the construction of a new street. The matter was referred to the Board's surveyor.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Shop Fitter, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Holloway's Pills and Ointment present the readiest and most reasonable means of removing hereditary, constitutional, and chronic disorders connected with impure blood and unhealthy skin; scurvy, scorbutic affections, unseemly eruptions, enlarged glands, and other blemishes yield to these purifying remedies, which eradicate the seeds of the complaint and avert mischief.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

BEST BATH STONE.
FARLEIGH DOWN, CORSHAM DOWN, BOX GROUND, COMBE DOWN, WESTWOOD GROUND. STOKE GROUND.
RANDELL, SAUNDERS, & CO., LD.,
CORSHAM, WILTS.

BATH STONE.
PICTOR'S MONKS' PARK. CORSHAM DOWN. BOX GROUND. FARLEIGH DOWN. COMBE DOWN. STOKE GROUND. WINSLEY GROUND. WESTWOOD
PICTOR and SONS, BOX, WILTS.

DOULTING FREESTONE.
THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.
THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.
HAM HILL STONE.
Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to
CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

NORTH'S IRON BUILDINGS
From National Agricultural and Colonial Exhibitions.
All Sizes, SALE or HIRE; and Sheets; also from Railways, and New Soiled.
IRON CISTERNS, all sizes, cheap.
LONDON ROAD, SOUTHWARK.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ASTON, BIRMINGHAM.—For additions to the workhouse buildings, including the erection of new laundry, alteration to the bakehouse, and two new pavilions; also for alterations and additions to the present relief office at Vauxhall; according to plans and specifications prepared by Messrs. Dunn and Hipkiss, Waterloo-street, Birmingham:—

Moffatt, J., Camp Hill	£16,291 0 0
Surman, S.	16,180 0 0
Webb, W. J.	15,776 0 0
Mallin, J., West Bromwich ...	15,743 0 0
Sapcote, W., and Sons	15,352 0 0
Bloore, W., Aston	15,280 0 0
Bissell, W., and Sons	14,985 0 0
Harley, J., and Son, Smethwick...	14,975 0 0
Wilson and Son, Handsworth ...	14,971 0 0
Smith, J., and Son...	14,958 0 0
Jeffrey and Son	14,890 0 0
Robinson, W...	14,763 0 0
Taylor, S.	14,705 0 0
Rowbotham, T.	14,695 0 0
Garlick, J., London	14,490 0 0
Barnsley, J., and Sons	14,314 0 0
Barker and Son, Handsworth ...	14,200 0 0
Hughes, T., Handsworth	13,955 0 0
Willcock, H., Wolverhampton*...	13,477 0 0

* Accepted. Rest of Birmingham.

ASHFORD, KENT.—For new shop-front and repairs, 34 High-street, for Mr. N. Hayward. Mr. H. J. Jeffery architect. By invitation:—

Knock, H.	£110 0 0
Baker, W.	98 10 0
Howland Bros. (accepted)	95 0 0

For plumbing, painting, and glazing:—

Everest, F.	132 16 0
Bowles, W.	71 5 0
Masters, W. (accepted)	62 0 0

All of Ashford.

BARTON, LANCS.—For the decoration of the interior of the Town Hall, for the local board:—

Lomax and Sons (accepted)	£70 0 0

ASHTON-UNDER-LYNE.—For alterations to warehouse, for Mr. W. Brown. Mr. J. H. Burton, Ashton-under-Lyne architect:—

Booth, R. H., Stalybridge	£385 8 10
Marland and Myles	377 12 7
Robinson, J.	333 15 0
Holmes, A.	313 19 6
Castle Hall Saw Mills Co., Stalybridge	313 15 0
Suddaby, T.	309 19 6
Marsden, A.	304 10 0
Williamson, J. W. (accepted) ...	301 14 6
Dean, T.	294 11 9

Rest of Ashton-under-Lyne.

AUDENSHAW.—For laying a 24in. by 16in. brick culvert and 12in. earthenware pipe sewer in Audenshaw-road, from near the L. and N.W. Railway bridge to Trail Dog bridge, for the Audenshaw Local Board. Mr. J. H. Burton, Ashton-under-Lyne, surveyor:—

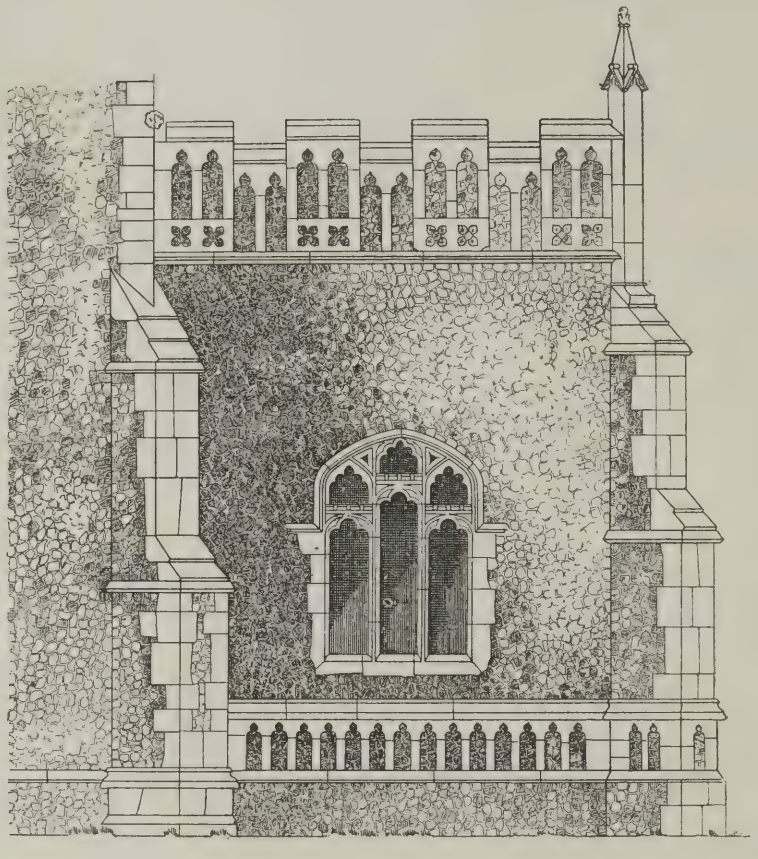
Mountain, W., Salford	£816 12 8
Marland and Myles	555 12 6
Worthington & Pownall, Manchester	546 16 0
Charlesworth, J.	490 0 0
Walmsley, C., Audenshaw	475 15 4
Irwin, R. (accepted)	395 10 0

(Surveyor's estimate £454 18s. 4d.)

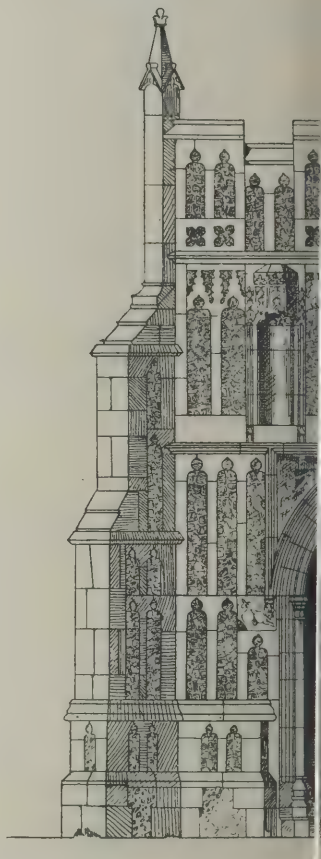
For laying 12in. earthenware pipe from Cross Gate to the L. and N.W. Railway Bridge:—

Mountain, W., Salford	270 0 0
Charlesworth, J.	242 10 0
Marland and Myles	222 12 9
Worthington & Pownall Manchester	191 3 0
Walmsley, C Audenshaw	170 0 6
Irwin, R. (accepted)	150 0 0

(Surveyor's estimate £208 15s. 0d.)



Rest of Ashton-under-Lyne.



BOURNEMOUTH.—For alterations and extensions to the Central Hotel, Bournemouth, for the proprietor. Messrs. Lawson and Donkin, Bournemouth, architects:—

Howell and Son, Bristol	£1,890 0 0
Hoare, W.	1,877 0 0
Jenkins and Son	1,825 0 0
McWilliam and Son...	1,755 0 0
Barrow and Entwisle	1,648 0 0
Walden, F.	1 550 0 0
Brown, S.	1,536 0 0
Lucas and Cosser (accepted) ...	1,480 0 0

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1702.
FRIDAY, AUGUST 19, 1887.

MASS AND DETAIL.

[N the eyes of the lay public a work of architecture is regarded in different ways, ccording to the faculty for observation or he cultivation and taste of the beholder. A erson with very little taste and knowledge f architecture and buildings looks at the nagnitude and general mass of a building; utline and grouping of the parts do not ffect him very much, though we find in this lass of persons a strange weakness to admire ny elaborate ornament and detail of whatver kind it may be, or however good or bad. he artistic qualities go for nothing. An xecrable house with a porch, perhaps with an rnamental barge-board gable, supported on orinthian columns—a suburban hybrid not t all uncommon—"goes down" with such one. It is "tasty," "pretty,"—that is nough; style, the laws or rules of design, re disregarded simply because they are not nderstood. Ill-placed and fulsome ornaent is a popular accompaniment, and the ore of it the better it pleases. We do not say ll uneducated people judge of a building in is way, for they are not all so entirely bereft f discrimination or taste, which is to a certin degree natural; but it will be found enerally that magnitude, balanced exteriors, id ornament invariably attract the crowd. façade with a portico, wings, and dome ill overawe, even if the proportions are bad; church with a lofty spire will do the same, owever poor the disposition and details. is wonderful, too, how strong the force association goes with people of this sort. here are many within our knowledge who nnot admire a church unless it has a spire: ne with a tower and simple lantern or low oof, or saddle-back termination, is thought achurch-like, and is not admired. So, too, ere are people who think all fine buildings ust be of stone, and they cannot bring themlves to admire a brick church, however good may be. This power of associating buildgs of certain kinds with distinct features id materials has, by a process of hereditary w, become so strong that everybody, ltivated or not, but chiefly the uncultivated, s a tendency to judge of works according an ideal acquired in his own limited here of observation. The dome, the urch spire, stone walls have been impressed om infancy on the mind, and with them also rtain forms associated buildings and proporons, from which it is impossible for the class are speaking of to tear themselves. Any parture from the conventional form, or e employment of a new material is looked on with disfavour. A new style is popular till the public have learned to see good points and to acquire a taste for it. becomes fashionable by being repeated.

Much in the same manner the mass of a ilding strikes the uninitiated eye before it comprehend detail and ornament. The o things are hopelessly related in the mind the ordinary spectator—that is, he cannot cover any relation between the two, and at he admires may be egregiously faulty. S in music: in a great performance the oruses are first appreciated by the general blic; the finer parts of the composition or strumentation can only be estimated by th few. As the chorus in the operas of yerbeer or Wagner represents a simultaeous movement of a multitude, or the otorio chorus that of the sentiment of a ultitude, so mass in architecture represents th simultaneous expression of the several rts of the building. The finer vocal and instrumental portions of a great concert, the emotional qualities of touch, cadence, and timbre perform the part of the details of a work of architecture, and their delicacy and technical execution can only be estimated by the musician.

The relation between mass and detail or ornament is one of the points which can be only fully appreciated by the competent artist. An ordinary observer looks at both indifferently. If the ornament pleases him by its lavishness, the building is beautiful; if by its absence or severity, it is declared dull and heavy. One French writer observes: "The masses hold the same place in the arts as general ideas in literature." So true is this that a book or an essay without an idea is unsuccessful. But as the mass grows out of the plan, the plan is the leading idea in architecture. It controls the distribution of mass and the outline—two things of the utmost importance in good architecture. Under the "Lamp of Power," Mr. Ruskin divides buildings into those whose interest is in their *walls*, and those whose interest is in the *lines* dividing their walls. In Romanesque and Egyptian works the wall is a confessed and honoured member; in the Perpendicular Gothic, called "our detestable Perpendicular," the eye is kept altogether on the lines. Ruskin's admonitions on the subject are so full of value that we may refer to them further. He says, speaking of positive shade as a sublime thing in an architect's hands, "So that Rembrandtism is a noble manner in architecture, though a false one in painting, and I do not believe that ever any building was truly great unless it had mighty masses, vigorous and deep, of shadow mingled with its surface. And among the first habits that a young architect should learn is that of thinking in shadow, not looking at a design in its miserable liny skeleton." Never were truer words uttered when we find the surface and shadow both reduced or sought to be minimised, and when architects are so fond of producing liny designs. Partly the fault is due to the practice of designing in lines or expressing form in this manner, instead of in solids or by tint. The architect cannot do better than follow the injunction of Ruskin: "Do but design with the owl's eyes first, and you will gain the falcon's afterwards."

No sounder advice to the architect than to sketch out his plan and arrange his masses in the rough. Is it not the mass of Peterborough, of Ely, and of the west front of Wells that makes these cathedrals even more striking as we approach them than other edifices in which the masses are less marked? The great western towers of Durham, of Wells, and Lincoln, present more power than the more frittered fronts of Winchester, Lichfield, and Salisbury, fine though they are. It was the value of mass that prompted the Norman and Mediæval architect to pronounce his building by three towers, the central being greater and higher. The imposing mass of the great western fronts like those of Peterborough and Wells—French in their idea—has rendered them objects of interest; they are not mere screens filled with sculpture, like the west front of Salisbury. To be truly massive there must be three dimensions—breadth and depth, as well as height, though the latter is least important of the three. St. Paul's Cathedral and the Houses of Parliament are other examples of grandeur in masses. Take the view of St. Paul's from Ludgate or Cannon-street, and the Houses of Parliament from any point bringing into view the Victoria Tower, and its greater sub-divisions of the river front. There is the mass in its entirety and in its sub-divisions; there may be mass without subdivision—then we call the effect lumpy. What would Peterborough front be without its grand arcade and recessed part in shadow, or Wells without its angle buttresses, its sculpture, and lancet arches? The Romanesque and Norman architects, in fact, had a greater sense of mass and proportion than those of any subsequent periods, when detail began to usurp its place.

Detail may be excessive; it may be weak, inappropriate, or coarse and vulgar. In the hands of an incompetent architect it generally fails from all of these. In the first place, like the literary critics of whom Pope writes the couplet—

> "Most critics, fond of some subservient art,
> Still make the whole depend upon a part,"

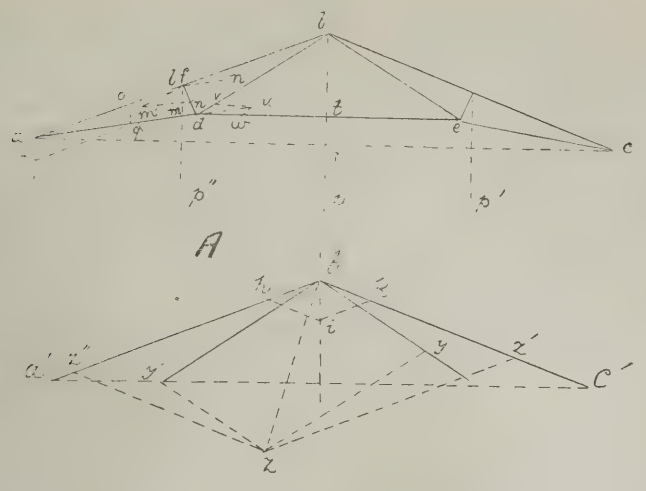
they think it looks learned to fill every wall space with details or windows. They indulge in panelling and tracery, shafts, and other ornamentation, not for the sake of relieving a blank wall here and there, but for the avowed purpose of getting rid of every piece of wall surface and plainness in the building. These designers have not the moderation or courage of the true artist in discerning that it is plainness and breadth that gives value to the detail, or that "modest plainness sets off sprightly wit." They must have ornament at any cost, and the effect is crowded or overloaded. Many of our architects fall victims to this prevailing habit; it is an oft-repeated offence of literary men, of orators, and artists. Whatever is excessive becomes weak, and weakness is the prevalent fault of excessive ornamentation. Excess begets mechanical repetition. Ruskin says, "Wherever you can rest, there decorate." The maxim is logical, though it may be carried out so far as to sacrifice breadth in wall surfaces. An arch, on the contrary, is hardly a place of rest, yet it is here the old architect showed his exuberance of ornament; the Mediæval porch, for example, was full of sculptural decoration. The eye rests certainly more at a porch than a wall. We pass by a wall, the attention is drawn to windows and doors, to the reredos, and altar, and pulpit; hence we can explain appropriateness of decoration by asserting that at every salient feature or object that arrests the eye we can decorate. The practice of the best architects has followed this principle. The mistake seems to be in confounding relief and rest. Relief is relative; there can be no relief in a blank wall, neither is there in one covered with ornament. The eye requires a relief in plainness after scanning a large expanse of elaborate ornament, as it seeks relief in ornament after blankness. There must be plainness to create ornament, and *vice versâ*; it is quite a relative thing in art; but it seems to be one of the hardest things to understand by most people—decorators included. They think that decoration is not complete if every foot of plain surface is not covered with some kind of ornament. If it is a room with pilasters at intervals, they are not spared; the owner or decorative artist thinks they ought to be covered with stencilled ornament or otherwise. If there is a moulding or cornice above decorated panelling, it too must have enrichments, the idea being that every inch of plain surface ought to be decorated—a mistake into which architects and ornamentists have fallen. What is appropriate and what not, is a question that can only be solved by the practised artist. Only a cultivated taste, a careful study of treatment of materials, and of the anatomy and structure of ornament can suffice to answer the question. Principles and textbooks are numerous enough, if only thought were given to place ornament in the right places and select the kind most suitable for the purpose. The greatest bane of those who use ornament for the purpose of captivating the fancy is the choice of natural types. Who can imagine anything more repugnant to common sense and good taste than to the florid scrolls and stem-like ornament indicating growth, incised or carved up pillars, or along window lintels of houses? Yet this sort of thing is tolerated

under the sanction of architects. The last fault of those who delight in detail is coarseness and vulgarity. It affects not only ornament, but tracery, mouldings, carving, glass painting, and metal-work. We notice it in heavy cornices, with clumsy mouldings, crowded enrichments, large, heavily carved capitals, keystones and strings, exuberant trusses and bosses. Details of this kind with some architects are a question of labour and price. The contract price is low, but the work has to be done, and the architect has to cut his details accordingly. Coarse mouldings of twice the size and boldness they ought to be are introduced in stonework or wood carving where small delicate members are required to give scale to the other details. Thus we may see in scores of churches erected under contract, heavy mouldings to woodwork and arcades, and clumsy capitals where we look for delicate carving. The furniture, pulpits, and fonts are coarse, the mouldings and carving clumsy.

Looking at the old work and at the modern by masters of design, we notice one principle which runs through the details, and that is proportion and gradation. The height and position of every feature is considered in the general proportions and mouldings; the higher they are, the less minute the detail; the closer to the eye, the more elaborate and numerous the members. One other distinction is found in good work: the details and mouldings are designed with reference to structural or decorative requirements, by which rule the smaller and more delicate mouldings are reserved for features of an ornamental character. These distinctions and gradations are peculiar only to the work of our leading architects. In the larger number of buildings we see they are unobserved; details are regarded as such, and thought unworthy of serious attention and study. They are "only details," and are left to the contractor or clerk of works. But it is in the finer lineaments as well as in the greater mass that the true artist is found. He works from the plan and great masses downwards to the smallest detail of the structure, and the least has as much attention bestowed upon it as the larger feature. And nowhere is this attention seen more than in the mouldings: the uncultivated builder sees little in them, the scholarly artist makes them a subtle and expressive language of his own.

SAFEGUARD AGAINST FIRE.

THE two disastrous fires which have occurred in London—one at Whiteley's, in Queen's-road, Bayswater, and the other in Gerard-street, Soho—have come as dearly-bought experiences of the necessity of attending to methods of construction that, till comparatively recent years, found little favour among architects. The iron and fireproof craze was of short duration. Capt. Shaw and others experienced in fires have condemned the construction in which iron plays an important part. As an exposed skeleton of metal, nothing has been proved more dangerous than girders and columns in large interiors, and yet builders, and architects, too, are still found employing iron, as being lighter and more economical than timber in warehouses and factories. At the great block of buildings destroyed in Queen's-road, it appears that the ordinary "fireproof" construction was used in the upper floors, but without any appreciable effect in saving the building, and that only in the basements at the corner of Queen's-road and Douglas-place and the floors of certain external courts where the "Dennett" arching was introduced, was the fire to a great extent controlled or cut off. The fire is reported to have raged fiercely in this part of the premises. Thus the provision department, forming a large block, 160ft. long by 35ft. wide, which had its ground-floor constructed of the "Dennett arching," was completely destroyed, except the basement, the upper floor of which was strong and impregnable enough to resist the shock of falling masonry, and was covered over several feet in depth with the fallen superstructure and *débris*.



We refer the reader to the description of the ruins which appeared in our last issue, in which the writer records another instance of the strength of this arched system to resist not only fire, but falling brickwork of many tons in weight. We know what has happened above these floors: the whole of the interior is burnt out, though ordinary fireproof floors and roofs existed in the large blocks of shops; girders are twisted into inconceivable shapes where visible. We have here, therefore, conclusive evidence of the unreliability of ordinary iron construction when unprotected from the flames. Stronger proof also cannot be wanted of the value of solid as against hollow construction. The solution of the whole problem of fire-resisting construction appears to be simply to subdivide the building horizontally and vertically with materials and construction that will resist intense heat and flame as well as water, and that will form solid, impervious barriers to the flames. There is only one kind of material and construction that has been proved to answer the purpose—namely, concrete strengthened by iron; and the "Dennett arch" seems to satisfy the conditions very efficiently.

An equally important and closely-allied question has been raised by the disaster in Soho, which the architect is specially called upon to consider. An awful loss of life has been narrowly escaped by sheer promptness of action on the part of the constable who, discovering that the premises were on fire, raised the alarm, and actually dragged the sleeping inmates from the burning tenements. It was a case of speedy deliverance through mere accident. Thirty people were fast asleep in the upper part of the premises, every one of whom would have fallen a victim to the fire, had not a constable's attention been directed to the glaring light through one of the doorways of the houses in the nick of time. A few minutes later, and they must have all perished. What was averted happily at Macclesfield House is likely to happen to hundreds of houses similarly constructed and occupied. The said house is described as having originally consisted of two separate dwellings. The lower portion was occupied by a maker of lamps, a quantity of oil having been stored in the ground floor; the upper floors were let to tenants, no less than twenty-six rooms being so let, but without efficient means of escape. How many premises, may we inquire, occupied as shops below, are not let out in precisely the same manner, with often more than one tenant to a single room, perhaps a whole family? In such houses there is usually found only one side entrance, when it is not through the shop itself. There are three or four stories above the shop, and if each floor contains three rooms, there might be accommodated in each house eight or nine single persons or as many families. Taking one of the average houses in the class of neighbourhood to which we refer, the side passage, often dark and narrow, traverses the full depth of the shop, and a single flight of stairs is taken up behind it at right angles to the passage till it clears the shop ceiling, to a landing or second staircase on the first floor, which is partitioned off by wooden partitions from the several upper floors. If we imagine fire to break out in the shop, the back stairs, if not the side passage, may be involved, directly cutting off escape from the floors above, while there is imminent danger to the upper stairs and landings, which are necessarily constructed of wood. Very few ordinary shop premises have better provision, and what makes matters worse, the partitio
are generally of wood. We have here
source of great danger in towns. There
no legislation to prevent the occupier
premises from letting the upper part of h
house to tenants, though the house has be
planned as a single dwelling-house, wi
only one means of entrance and exit. Th
Metropolitan Building Acts do not pr
vide against parcelling off the interior in
any number of rooms; the only section bea
ing on the subject is Section XXII. of th
Metropolis Management and Building Ac
Amendment Act, 1882, which states: "I
every public building, and in every oth
building containing more than 125,000 cub
feet, and used as a dwelling-house for sep
rate families, the floors of the lobbies, co
ridors, passages, and landings, and also th
flights of stairs, shall be of stone or oth
fireproof material." This section was clear
framed to meet the class of premises
which we refer, but is practically a dea
letter for houses of the ordinary kind let
shops: very few of such premises would co
tain so large a cubic capacity as 125,000f
An ordinary four-storied house and sho
would not contain more than 40,000 to 50,0
cubic feet, so that the clause is practicall
inoperative in London. The question, ther
fore, is one that calls for legislative enac
ment, which shall provide fireproof lobbie
passages and landings and stairs, as in th
above section, and also a special means of escap
from each floor occupied by different tenant
The latter is of paramount importance. W
think it ought to be made a regulation tha
before shop premises can be let as tenement
above, a distinct staircase of fireproof mat
rial should be provided for, say, a certai
number of tenants residing above th
shop, with easy entrance from every flo
and directly leading into the street. Th
stairs should be constructed of concrete
certain ingredients, and the walls inclosing
should be at least a brick in thickness. Su
separate entrances and staircases are to
seen in middle-class dwellings erected in fla
like those built by the late Mr. Allen,
Stoke Newington, which were models of co
struction in their way, every floor of whi
was of concrete and iron constructed in
simple and inexpensive manner. But hous
with shops below, and inhabited by tenan
above, are common in London. The who
care of the premises is left in the hands of
man or woman residing in the basement
attic, and the tenanted floors are entirely d
pendent on the safety of the shop. A
accidental spark or lamp explosion ma
ignite the inflammable and over-drie
stock in the shop, and the whole
the tenants above are at its merc

UNEQUALLY-LOADED ROOF-TRUSSES

THE strains acting upon iron roof-truss
will only be symmetrical when the lo
consists of the roof material or that with o
uniform layer of snow on the top, for t

Fig. 1

wind pressure will only act on one side at a time; hence there will usually be a difference between the loads on the two sides of a roof.

In some cases it also happens that the permanent load is not uniformly distributed over the surface of the roof, as, for instance, in the roof over a Bessemer converting shed where, on the side where the converters are placed, it is necessary to have the roof open.

The loads on roofs measured on the surface (not on the covered area) due to different covering materials are as follows per 100 superficial feet: Lead, 7cwt.; zinc, 1½cwt.; corrugated iron, 3½cwt.; slates, 7½cwt. to 9cwt.; tiles, 8cwt. to 15cwt.; ¾in. boarding, 2½cwt.

The wind pressure is usually taken, in this country, as equal to 50lb. per square foot on a surface normal to its direction; therefore, to find the direct pressure normal to the surface of the roof, its angle to the direction of the wind must be taken into account, and with this matter we shall deal subsequently, assuming for our present purpose a total vertical load on the roof-truss, one side being entirely covered, and the other partially, every alternate bay between the principals being left open, there will then be twice the load on one side that there is upon the other.

In Fig. 1 $a\ b\ c$ represents a main roof principal consisting of two secondary trusses $a\ b\ d$ and $c\ b\ e$, joined by an apex plate at b and a horizontal tie $d\ e$.

Let the total span $a\ c$ = 40ft.; the rise $b\ s$ = 8ft.; and the height $b\ t$ from the apex to the tie $d\ e$ = 6ft., and the distance between main principals 10ft.

A slate covering being used, the load per square foot on the covered part may be taken, including wind, as 40lb. per superficial foot. We must now find the length of the rafter $a\ b$. All the dimensions we shall require will be determined by the properties of right-angled triangles. The lengths of the elements will be the same on both sides of the centre line $b\ s$, but the load on $b\ c$ will be one-half of that on $a\ b$.

$$a\ b = \sqrt{as^2 + bs^2} = \sqrt{20^2 + 8^2} = 21{\cdot}54\text{ft.},$$

the total load on $a\ b$ will therefore be, as the principals are 10ft. apart, $10 \times 21{\cdot}54 \times 40\text{lb.} = 8{,}616\text{lb.}$, and that on $b\ c$ 4,308lb.

The loads on, and, therefore, the re-actions at the points of support a and c must now be found.

The horizontal springing line $a\ c$ is divided into four equal parts by the lines $f\ p''$, $b\ p$, and $g\ p'$, because the struts $f\ d$ and $g\ e$ are placed at the centres of the rafters $a\ b$ and $b\ c$; working then upon the principle of moments, the weight upon a will be, if p'' p and p' represent the total loads at f b and g, $W = \dfrac{30\,.\,p'' + 20\,p + 10\,p'}{40}$.

This is the weight which passes through the truss rods only, for there is a further load, half of that between a and f, which comes directly upon a, and does not, therefore, affect the truss.

At f will be carried half the load on $a\ f$, plus half that on $f\ b$—that is, half the whole load on $a\ b$, or 4,308lb. = p''. At b will be carried half the load on $f\ b$, plus half the load on $b\ g$; therefore, 2,154lb. + 1,077 = 3,231lb. = p, and at g is carried half the load upon $b\ c$; therefore, 2,154lb. = p'. The reaction, then, at a will be $W = \dfrac{30 \times p'' + 20 \times p + 10 \times p'}{40} = \dfrac{30 \times 4308 + 20 \times 3231 + 10 \times 2154}{40} = 5{,}385\text{lb.}$, and similarly the reaction at c will be $W' = \dfrac{30 \times p' + 20 \times p + 10 \times p''}{40} = 4{,}308\text{lb.}$

These two reactions should be equal to the total weight passing through the main truss to the points of support—5,385 + 4,308 = 9,693lb., and 4,308 + 3,231 + 2,154 = 9,693lb., also thus checking the results.

In order to determine the strains upon the different parts of the truss, the diagram should be drawn out to a large scale, such as one inch per foot, so that the loads may be accurately set down to scale, and the resulting strains measured off, with a sufficiently close approximation to absolute truth.

Through the point a draw a vertical line, and to any convenient scale set off $a\ r$ equal to the reaction 5,385lb., then complete the parallelogram $a\ r\ q\ o$; then will $a\ o$ = the thrust on the rafter $a\ f$, and $a\ q$ = the tension on the tie bar $a\ d$. The thrust is found to scale 26,750lb. and the tension 25,150lb.

At the point f where the rafter is supported by the strut $f\ d$, there is a vertical load p'' = 4,308lb., on the vertical line make $f\ m$ = 4,308, and complete the parallelogram $f\ l\ m\ n$, then $f\ n$ will represent the thrust on the strut $f\ d$, and $f\ l$ that on the rafter $f\ a$ due to load at f. These respectively scale 4,050lb., and 1,680lb., and this latter being opposed to the reaction thrust on the rafter will at f so reduce it that for the part $f\ b$ the thrust will be 26,750 − 1,680 = 25,070lb.

About the line $f\ n$ describe the parallelogram $f\ m'\ n\ n'$, making $m'\ n$ and $n\ n'$ respectively parallel to $a\ d$ and $d\ b$; then will $m'n$ and $n\ n'$ represent the strains brought upon the ties $d\ a$ $d\ b$ through the strut $f\ d$; the secondary truss $a\ b\ d$ being symmetrical, the strains will be equal, and are found to scale 10,200lb. each.

Deducting this amount from the 25,150lb. acting at a on the tie $a\ d$, there is left 25,150 − 10,200 = 14,950lb. acting in the direction $a\ d$; this must be resolved upon the two ties $d\ b$ and $d\ t$, so that on $d\ b$ there will be an additional strain besides that brought upon it through the strut $f\ d$.

Produce $a\ d$ and make $d\ u$ = 14,950lb., complete the parallelogram $d\ r\ u\ w$, then will $d\ w$ = the strain on the tie $d\ t$, and $w\ u$ will equal the strain from this source upon $d\ b$. These lines scale 10,770lb. and 4,800lb. respectively, so the total tensions on $d\ b$ will be 15,000lb.

We must now refer to the strains on the other half of the main principal before dealing with those at the apex b. The load at g being half that at f, the strains caused by it on the parts $g\ e$, $e\ c$, and $e\ b$ will be half those on the corresponding parts $f\ d$, $d\ a$, $d\ b$. They will therefore be, on $g\ e$ = 2,025lb., on $e\ c$ = 5,100lb., and on $e\ b$ = 5,100lb. The angles of the rafter $c\ b$ and tie $c\ e$ being symmetrical with those of the rafter $a\ b$ and tie $a\ d$, the thrusts and tensions will be in direct ratio to the reactions 4,308lb. and 5,385lb. The reactionary thrust on the rafter at c will be 26,750 × 4,308 ÷ 5,385 = 21,400lb.; the tension on the tie at c = 25,150 × 4,308 ÷ 5,385 = 20,120lb. The remainder strain on $c\ e$ to be resolved upon $e\ t$ and $e\ b$ will be, therefore, after deducting the strain opposed by that due to the load at g = 20,120 − 5,100 = 15,020lb. This strain resolved between $e\ b$ and $e\ t$ should give on the latter 10,770lb., the same as on $d\ t$, the bar being continuous from d to e; therefore it should be 14,950lb. The slight difference is due to error in scaling; but it is so small, $\frac{7}{1{,}502}$, that it is not practically appreciable; also the additional strain on $e\ b$ may be taken as 4,800lb., making the total on that bar 5,100 + 4,800 = 9,900.

At A (Fig. 1) is shown a separate diagram of the apex for the sake of clearness. $b\ a'$ and $b\ c'$ are the upper ends of the rafters $b\ a$ and $b\ c$, and $b\ d'$, $b\ e'$ are the upper ends of the ties $b\ d$ and $b\ e$. We will first deal with the load at b, which = p = 3,231lb. Draw the vertical line $b\ t'$ from b, and mark off $b\ i$ = 3,231lb. Complete the parallelogram $b\ h\ i\ k$, then $b\ h$ and $b\ k$ are the thrusts on $b\ a'$, $b\ c'$ due to the load at b: they are equal, each being 4,350lb. The strains on the ties $d'\ b$ and $e'\ b$ must now be resolved upon the rafters $b\ a'$, $b\ c'$; but their resultant must first be found. The strains on these ties, as given above, are 15,000lb. and 9,900lb. respectively; make $b\ y'$ = 15,000 and $b\ y$ = 9,900; complete the parallelogram $b\ y'\ z\ y$, then will the diagonal $b\ z$ be the resultant of the two tensions.

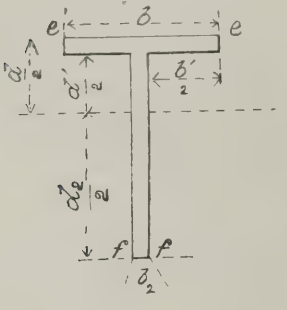
From the point z, and parallel to $a'\ b$ and $c'\ b$ respectively, draw the lines $z\ z''$ and $z\ z'$; then $b\ z''$ = 20,750lb. is the thrust brought upon $b\ a'$, and $b\ z'$ = 16,250lb. that brought upon $b\ c'$ = by the ties $b\ d$ and $b\ e$.

For equilibrium to obtain in the rafters, the sum of the thrusts passing downwards from the loads and from the ties must be equal to the upward thrusts from the reactions at a and c.

Adding together the two thrusts at b and that at f, we have 20,750 + 4,350 + 1,680 = 26,780lb; the scaled reaction is 26,750lb., so these quantities only differ by about one-ninth of 1 per cent., and may therefore be practically taken as accurate. In like manner summing the thrust for the rafter $b\ c$, we find 16,250 + 4,350 + 840 = 21,440lb., as against a reaction of 21,400lb., a difference of about one-sixth of 1 per cent.

The tension on the tie $d\ e$ can be checked by the principle of moments; the depth of the truss $b\ t$ = 6ft. We have the reaction 5,385lb. acting about the point b at a horizontal distance of 20ft., and the load at f = 4,308 acting downwards at a horizontal distance of 10ft; hence the resulting moment will be equal to 5,385 = 20 − 4,308 × 10 = 64,620ft.-lb., and as the distance at which the resistance of the tie acts from b is 6ft., the tension at t = 64,620 ÷ 6 = 10,770lb., the same as was found by scaling on the tie $d\ t$. The same result is found by calculating from the point c in the same manner, thus: 4,308 × 20 − 2,154 × 10 ÷ 6 = 10,770lb., and thus the whole of the strains have been ascertained and checked. We will now determine the sections of the different parts.

Commencing with the rafter $a\ b$ the difference of thrust upon $a\ f$ and $f\ b$ is so slight that the section will be made the same throughout, which will also be more convenient for the purposes of manufacture.



This member must be treated as a strut, and for purposes of calculation its length will be half $a\ b$ = 21·54 ÷ 2 = 10·77ft. *Laterally*, it will be stiffened by the purlins of tee iron which, to suit the slates, will be placed 10½in. apart along the rafters. The ratio of the depth at right angles to the length must be taken for r in Gordon's formula, which for the breaking weight in pounds per sectional square inch for wrought iron struts of this kind of construction is $= 2{,}240 \times \dfrac{19}{1 + \frac{r^2}{900}}$, and taking 4 as the factor of safety the working strain per square inch will be $= 560\ \dfrac{19}{1 + \frac{r^2}{900}}$. Let the rafter consist of a tee iron 6in. deep, then r = 10·77

$\div 0{\cdot}5 = 21{\cdot}54$, and $21{\cdot}54^2 = 464$ (nearly); the working strain per square inch will then be $= 560 \times [19 \div (1{\cdot}515)] = 7{,}016$lb. The rafter will, however, also have to resist the bending strain due to the load distributed along its length.

Slates are commonly carried on tee irons 1½in. by 1½in. by ¼in. thick, 10½in. apart; but the main principals must not be so far apart as 10ft., or, if they are, there must be intermediate rafters consisting of plain tee irons resting on purlins attached to the main rafters at *f* and *g*; if there are two of these between each two main rafters, the distance between them will be 3·33ft., and the load upon each and also upon *a f* and *f b* will be: 10·77ft. × 3·33ft. × 40lb. = 1,436lb. The horizontal span is 10ft.

We must now examine into the resistance of tee irons to transverse strains. Fig. 2 shows a

Fig. 2

cross section of a tee iron in the positi on in which it would be placed to act as a rafter.

Let the dotted line *a a* show the position of the neutral surface, then the moments of resistance of the section above it must be equal to the moments of resistance of the section beneath it. Considering, then, the part above *a a* as half the section of a girder, if M = pounds moment of resistance in inch-pounds, dimensions being in inches, and S′ the maximum working resistance in pounds per square inch at the part *e e* most distant from the neutral surface, $M = \frac{S'(bd^3 - b'd'^3)}{12 \cdot d}$, being one-half of the usual expression for the whole section if the lower part were the same as the upper. Similarly dividing the expression for a solid beam, the moment of resistance of the section below *a . . . a*, if S = maximum working resistance of fibres in pounds per square inch at *f* will be $M = \frac{S \cdot b_2 d_2^2}{12}$; therefore, $\frac{S'(bd^3 - b'd'^3)}{2d} = \frac{S \cdot b_2 d_2^3}{12}$. But the resistances of the fibres per square inch are in direct ratio to their distances from the neutral surface; therefore, $\frac{S}{S'} = \frac{d_2}{d}$, and, therefore, $\frac{bd^3 - b'd'^3}{d} = \frac{b_2 b_2 d_2^2}{d} = \frac{b_2 d_2^3}{d}$, and $bd^3 - b'd'^3 = b_2 d_2^3$.

If now we fix some of these dimensions, we shall be able to determine the remaining, and then find the resistance of the whole section.

Let $b = 4$in., $b' = 3{\cdot}5$in., $d = 2{\cdot}8$in., $d' = 1{\cdot}8$in., and $b_2 = 0{\cdot}5$in.; then $bd^3 - b'd'^3 = b_2 d_2^3$ becomes $4 \cdot 2{\cdot}8^3 - 3{\cdot}5 \times 1{\cdot}8^3 = 0{\cdot}5 \cdot d_2^3$, wherefore $d_2 = 5{\cdot}128$in. $\frac{d}{2} = 2{\cdot}564$in., and the whole depth will be $1{\cdot}4 + 2{\cdot}564 = 3{\cdot}964$in., the nearest obtainable section to which will be 4in. × 4in. × ½in. thick. As the upper part of the section, that above *a . . . a*, will have a resistance equal to that of the lower, the whole resistance will be twice that of the part between *a a* and *f f*, or equal to the resistance of a solid beam having depth d_2 and breadth b_2. The moment of resistance of such a beam will be $M = \frac{S \cdot b_2 d_2^2}{6}$. Let S = 11,200lb., then $M = \frac{11{,}200 \times 0{\cdot}5 \times 5{\cdot}128^2}{6} = 24{,}545$ inch-pounds.

The moment of strain at the maximum will be $M = \frac{W l}{8}$, where W = safe load and *l* = span in inches. The horizontal span is 10ft. = 120in., therefore $\frac{W \times 120}{8} = 24{,}545$; $W = \frac{8 \times 24{,}545}{120} = 1{,}636$lb. The actual load on the intermediate rafters was found to be 1,436lb. so the section of tee iron 4in. × 4in. × ½in., will suit very well, allowing a little margin over the absolute strength required.

On the rafter *a f* there is also a load of 1,436lb. producing a bending strain, and the moment of this strain will be $M = \frac{W \cdot L}{8} = \frac{1{,}436 \times 10 \times 12}{8} = 21{,}540$ inch-lbs. Proceeding as before, let $b = 4$, $b' = 3{\cdot}5$, $b_2 = 0{\cdot}5$, $d = 4$, $d' = 3$. $4 \times 4^3 - 3{\cdot}5 \times 3^3 = 0{\cdot}5\, d_2^3$; $d_2 = 6{\cdot}83$in. The moment of resistance of the whole section will be equal to that of a beam 6·83in. deep and ½in. thick. $M = \frac{S \cdot b_2 \cdot d_2^2}{6} = \frac{11{,}200 \times 0{\cdot}5 \times 6{\cdot}83^2}{6} = 43{,}539$ inch-lb. Here, then, only one-half the sectional area will be required for the bending strain. The section of the tee iron is 4in. by 5·415in., by ½in.—say, 4in. × 5½in. × ½in. These strains on this section due to the bending load will be 5,600lb. per sectional square inch at the fibres *f*, and $5{,}600 \times 2 \div 3{\cdot}415 = 3{,}279$lb. per sectional square inch on the fibres at *l l*. The total area of the section is $(4 + 5) \times \frac{1}{2} = 4{\cdot}5$ square inches The strain per square inch due to the direct thrust will be 26,750lb. ÷ 4·5 = 5,944lb. per sectional square inch over the whole section, from the neutral surface to the edge *f*. This will gradually diminish because of the tension due to bending strain on the under side of the bar, at *f* the compression per square inch will be 5,944 − 5,600 = 344lb. per square inch.

The sectional area of the part of the rafter above the neutral surface will be $(4 + 1{\cdot}5) \times \frac{1}{2} = 2{\cdot}75$ square inches. As has been shown above, the strut for direct strain will bear safely 7,016lb. per square inch, so deducting the 3,279 bending strain thrust we have available 7,016 − 3,279 = 3,737lb., showing a deficiency of 5,944 − 3,737 = 2,207lb. per square inch. This, on 2·75 square inches will be 6,069lb., but this is taking the maximum 3,279lb. through *a . . . a*; but the average will be the mean between the strains on the outside and inside of the horizontal limb which $= \frac{(3{,}279 + 2459{\cdot}2)}{2} = 2869{\cdot}12$lb., making for the 2·75 square inches $5{,}944 - (7{,}016 - 2869{\cdot}12) \times 2{\cdot}75 = 4941{\cdot}75$lb., requiring, therefore, in the upper part of the section an additional area of $4941{\cdot}75 \div 7{,}016 = 0{\cdot}704$ square inch, so it will be sufficient to increase the thickness of the tee iron to ⅞in., or it might be done by increasing the depth of the section to 6in., as originally calculated on, as this would help by increasing the resistance to the bending strain.

The direct load producing bending strain on the rafter *b c* will be one-half that on *a b*, and it will be practically accurate to regard the moment of resistance as varying with the thickness of the metal. The resistance in the former case was twice the moment of strain if the whole section were taken; hence, the area required will be, for the bending strain, 4in. × 5½in. × ¼in.

We will assume that for *b c* a tee-iron 4in. × 5½in. × ⅜in. thick is used, and see how it works out for strength. Its sectional area will be $9{\cdot}125 \times 0{\cdot}375 = 3{\cdot}422$sq.in.; therefore, the thrust per square inch due to direct strain $= 21{,}400 \div 3{\cdot}422 = 6{,}254$lb. (nearly). The lower part of the section being in tension from the bending strain will receive and dispose of the thrust on that part. The area being three times that required to resist the maximum moment, the maximum direct strain (at *f* Fig. 2) will be $11{,}200 \div 3 = 3{,}733{\cdot}3$lb. per sectional inch. The mean fibres in the horizontal member are distant from the neutral surface 2in. − 3/16in. = 1·8125in.; hence, as *f* is distant 3·5in. from the neutral surface, the mean compression on the horizontal member from bending strain will be $3{,}733{\cdot}3 \times 1{\cdot}8125 \div 3{\cdot}5 = 1{,}933$lb. The mean thrust, therefore, in the upper part of the section will be 6,254 + 1,933 = 8,187lb. per square inch on a section of 1·5sq.in. The excess, then, is $(8{,}187 - 7{,}016) \times 1{\cdot}5 = 1{,}756$lb., which may be covered by making the section 6in. deep. For appearance sake the rafters on the two sides of the main principal should have the same outside dimensions; and moreover, for our direct thrust we have calculated upon a depth of 6in. Therefore, the scantlings to be adopted for this roof are: For heavily-loaded rafter *a b*, 4in. × 6in. × ⅝in.; and for light rafter *b c*, 4in. × 6in. × ⅜in. The other elements of the truss, being subject to simple strains only, will be more easily dealt with.

The struts *f d* and *g e* may conveniently be made of cast iron, embracing the web of the rafter at the top and the tie bars at the bottom; the length *f d* is 2·2ft. The thrust on these struts is so little, 4,050lb., that they cannot be kept down practically to theoretical size; for by the formula, $560 \times \frac{36}{1 + \frac{r^2}{400}}$ = safe working resistance per square inch, we find for a strut 1in. in diameter, a resistance of 7,280lb., which would be for the area of the strut $7{,}280 \times {\cdot}785 = 5{,}714{\cdot}8$lb. It would not do in practice to make the strut of this section: but it should be in the form of a cross, 2in. wide in each direction and ¼in. in thickness. The ties will carry safely a strain of 11,200lb. per sectional square inch, so their areas will be as follows, and the diameters taken will be the next commercially obtainable above those corresponding to the theoretical areas:—

For the tie		The diam. required
a d,	$25{,}150 \div 11{,}200 = 2{\cdot}245$sq.in. =	1½in.
d b,	$15{,}000 \div 11{,}200 = 1{\cdot}339$sq.in. =	1⅜in.
d e,	$10{,}770 \div 11{,}200 = 0{\cdot}961$sq.in. =	1in.
c e,	$20{,}120 \div 11{,}200 = 1{\cdot}790$sq.in. =	1⅜in.
e b,	$9{,}900 \div 11{,}200 = 0{\cdot}884$sq.in. =	1in.

It now remains to determine the number and sizes of the bolts required at the different joints. The general forms of the joints are shown at Fig. 3. *a a* and *b* are bolts in the apex joint, which is made by two plates having between them the webs of the main rafters and the eyes of the secondary ties (*d b* and *e b*, Fig. 1); *c* and *d* are the bolts at the top and bottom of the struts (*f d* and *g e*, Fig. 1); *e* is the cotter connecting the tie with the cast-iron shoe, and $f_1 f_1$ the bolts connecting the rafter with the same.

There being two joint plates at the apex, the rivets will be in double shear; therefore, the strain will be taken on four sections. The working resistance to shearing strain is 8,960lb. per sectional square inch. The thrust on *a a* will be 25,070lb.; $25{,}070 \div 8{,}960 = 2{\cdot}8$ square inches, corresponding to two rivets of 1⅜in. diameter. It must be seen, however, that we also have sufficient bearing area in the body of the rivet. This area will be the diameter of the rivet multiplied by the thickness of the plate through which it passes. The working resistance will be the same as that for shearing strain; therefore, the bearing area must also be 2·8sq.in. at least. Now, the thickness of the web of the rafter is ⅝in., hence the bearing area of each rivet (say) 1in. diameter, will be 0·625sq.in., so that five rivets will be required instead of two.

For appearance sake the joints will be made the same on both sides of the truss. On the bolt *b* is the strain from the secondary tie (*d b*, Fig. 1) = 15,000lb., and the area required will be $15{,}000 \div 8{,}960 = 1{\cdot}67$sq.in. The tie is 1·375in. in diameter: that will therefore be the thickness of the eye, and the bolt will require to be 1½in. diameter, this will give a bearing of $1{\cdot}375 \times 1{\cdot}25 = 1{\cdot}719$sq.in. The thickness of the joint plates to give equal bearing for the bolt must evidently be 11/16in. each, where the bolts pass through; the area of the two sections in shear will be ample, being 2·45sq.in.

The pressure on the bolt *c* is only 4,050lb., hence the bearing area required will be under half a square inch, so as the rafter is ⅝in. thick, a bolt ¾in. diameter will give sufficient bearing.

The bearing required on the bolts *f f* at the shoe will be $26{,}750 \div 8{,}960 = 3$sq.in. (nearly), to make this up four bolts 1½in. diameter would be required, or to shorten the shoe, a ⅝in. strip may be riveted on each side of the foot of the rafter, as shown at *g*, then with the extra thickness sufficient bearing would be given by two 1½in. bolts, for we should have $2 \times 1{\cdot}125 \times 1{\cdot}375 = 3{\cdot}09$sq.in.

The connection now of the tie (*a d*, Fig. 1) with the shoe must be considered. The bearing area required is $25{,}150 \div 8{,}960 = 2{\cdot}81$sq.in. The diameter of the tie is 1¾in., and the

ickness of the eye may be made 2in.; then
e thickness of the cotter to give the proper
aring = 2·81 ÷ 2 = 1·405in. = (say) $1\frac{7}{16}$in. The
tter in practice should be made about $2\frac{1}{4}$in.
ide. The only joint of the truss remaining
that at which the strut and three ties meet,
d in order to find the strain on the bolt *d* we

Fig. 3

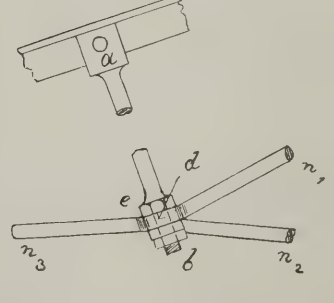
ust have recourse to a diagram as shown at
Fig. 3.
l is the centre of the bolt connection between
s and strut, the directions of which are
licated by the lines corresponding as follows
the bars in Fig. 1; *d n* to strut *df*, *d n'* to
d b, *d n*$_2$ to tie *de*, and *d n*$_3$ to tie *d a*. The
ow heads show the directions of the strains
ing at *d*.
Produce *n d* and make *d h* = 4,050lb., the
npression on the strut; make also *d k*
25,750lb. the tension on the tie, and complete
parallelogram *d k i h*; then will *d i* be the
ultant of the two forces *d k* and *d h*: it scales
6001b. Now make *d l* = 15,000lb., and *d o*
=10,770lb., and complete the parallelogram
m o; then *d m* will be the resultant of the
ces *d l* and *d o*, and it is found to be equal to
and also opposite in direction, but in the
ne straight line, so that *d i* and *d m* stand to
h other as action and re-action, and the
ce upon the bolt *d* is 24,6001b.; the size of
t to give the necessary bearing area must be
nd: what this will be will depend in a great
asure upon the way in which the joint is

Fig. 4

e; one method is shown in Fig. 4 (A) which
viewlooking upwards; the same distin-
hing letters are used as at A, Fig. 3.
this arrangement the bearing will be de-
ined for each bar according to its strain;
as shown here the bars *d n*$_1$ *d n*$_3$ are made
inuous, having a single eye at the centre
ugh which the bolt *d* passes; thus a part of
strain passes from *d n*$_3$ to *d n*$_1$ without
ting the bolt *d*; we must determine, there-
how much pressure does fall on the bolt
in the eye referred to.
his strain will be the resultant of the strains
n$_1$ and *d n*$_3$. Referring again to the dia-
A, Fig. 3, complete the parallelogram
k, then will *d p* be the resultant required.
It scales 13,0001b., hence the bearing area corresponding is 13,000 ÷ 8,960 = 1·45sq.in. The bearing in both sides of the fork on tie *d n*$_2$ = 10,770 ÷ 8,960 = 1 20sq.in. That on the two sides of the strut *d n* = 4,050 ÷ 8,960 = 0·45sq.in. The thickness of the tie *d n*$_3$ is 1·75in., hence the required diameter will be 1·47 ÷ 1·75 = 0·838in., say $\frac{7}{8}$in.; adopting this diameter, the length of bolt required in the fork of *d n*$_2$ will be 1·2 ÷ 0·875 = 1·37in., or the thickness of each side of the fork must be $1\frac{3}{8}$in. The length required in the sides of the strut will be 0·45 ÷ 0·785 = 0·51in.: but, practically, these sides would require to be made $\frac{5}{8}$in. thick.

We must now examine the shearing strains. The working loads being the same as for bearing strains, the required areas will be the same. In each case the bolt is in double shear, therefore the sectional area required for the central part will be 1·45 ÷ 2 = 0·725sq.in., therefore nothing under an inch bolt will do, and the thicknesses will be for the eyes: the centre 1·75in., each side of the fork *dn*$_2$ = 0·7, say $\frac{11}{16}$in.; and the strut sides as before. The only objection to this joint is its width in the fork of the strut, which, in this case would be $3\frac{3}{8}$in. between the jaws. Another form, shown at B, Fig. 4 is therefore sometimes used. In this arrangement all the bars have single eyes at the ends, and these are held between two joint plates, the tensile strain on which will be the resultant *dm* (A, Figure 3) = 24,6001b, the nett area therefore of the two plates (after deducting the bolt holes) must be 24,600 ÷ 11,200 = 2·19sq.in. The diameters of the bolts will be determined on precisely the principles used above; hence it will not be necessary further to exemplify it in this place.

It may, however, be useful here to set down the general relation existing between the bearing length and diameter of bolts, always, of course, assuming that the safe working strength is taken to be the same for compression as for shearing per sectional square inch.



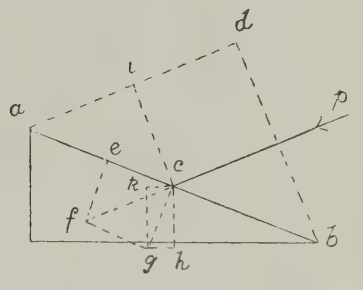
Let L = length of bearing, and D = diameter of bolt, both in inches; then the bearing area is = L × D, and the shearing area for single shear = 0·785 D^2, but these two must be equal, therefore L × D = 0·785 D^2; and L = 0·785 D; but for double shear L = 1·56 D.

In places where rivets are used so much bearing area is not required, as the strain is taken up partly by the friction of the plates which are tightly pressed together by the contraction of the rivets in cooling.

We have above taken a simple form of truss for our example, but the principles to be followed in other cases are precisely analogous, and therefore it is unnecessary to amplify illustrations. We shall, however, before leaving this part of the subject, show one more form for the joint at *d*, to be used when the strut is of wrought iron.

The form of joint referred to is shown in side

Fig. 5



elevation in Fig. 5, at *b*. The top of the strut at *a* is formed with a fork the same as before.

The ties *d n*$_3$ *d n*$_1$ (A, Fig. 3) are made in one length here also, but flattened out at the centre, and an eye formed through which the end of the strut passes, as also through an eye in the tie *d n*$_2$, the whole being secured by the nut *b* on the screwed end of the strut; a collar *e* forged on the strut forms an abutment against which the ties are pressed by the nut *b*. The shearing strain on the screwed end will be that brought upon it by *d n*$_2$, and the strain (13,0001b.) which acted as a shearing force in the first joint (A, Fig. 4) will now become tension on the screwed end of the strut, between the collar *e* and the nut *b*.

We will now pass to the consideration of the effect of wind-pressure upon roofs, as intimated in the commencement of this article.

In Fig. 6, let *a b* represent the line of rafter

Fig. 6

on one side of a main principal, and for purposes of calculation let a length of roof of 1ft. be taken, and the wind-pressure be taken as 50lb. per square foot on a surface *at right angles to its direction*.

Let *c* be a point at the centre of the rafter, and draw *p c* in the direction of the wind, draw *a d* parallel to *c p*, and from *b* draw *b d* perpendicular to *a d* and therefore to *c p*, the total wind-pressure will be on the 1ft. strip; 50lb. multiplied by *b d*, therefore the pressure per foot on the roof = 50 × *d b* ÷ *a b*; but this does not act normally to the surface of the roof. Produce *c p* to *f*, making *c f* = 50 × *d b* ÷ *a b* and complete the parallelogram *c g f e*, then *c g* will be the normal pressure on *a b* per square foot. From *c* draw *c i* parallel to *d b* and at right angles to *a d* and *c p*; then in the right-angled triangle *a i c* the angle *c a i* is the complement of the angle *a c i*, and because *i c f* is a right angle *f c e* is a complement to the angle *a c i*, and therefore = the angle *c a i*, and the right angles *c e f*, *c i e* are equal. Therefore the triangles *a i c* and *c e f* are similar; but *c g f* and *f e c* (being halves of a parallelogram) are similar, and *a d b* is obviously similar to *a i c*; hence the triangles *c g f* and *d b a* are similar, and *d b* ÷ *a b* = *c g* ÷ *c f*.

Let P = normal pressure per square foot on the surface of the roof, then P = 50 × (*d b* ÷ *a b*) × (*c g* ÷ *c f*) = 50 × *d b*^{2} ÷ *a b*^{2}. This force is to be again resolved into two others, the one pressing vertically upon the roof, and the other tending to slide it upon its bearings; complete the parallelogram *c h g k*, then *c h* will be the vertical component per square foot of roof surface; let *w* represent this, then $w = P \times \frac{ch}{cg}$ $= 50 \times \frac{cg^2}{cf^2} \times \frac{ch}{cg} = 50 \times \frac{cg \times ch}{cf^2}$. Scaling these lines we find for the load due to the wind pressure $w = 50 \times \frac{35 \times 33}{50^2} = 23$lb. per superficial foot. Therefore, in calculating the strains this must be added to the weight of the roof covering on one side, and the sizes of the elements for that side having been determined, both will be made to them, as the wind will be sometimes on one side and sometimes on the other.

Having the above formula, it is evident that in practice it will not be necessary to draw all the lines shown in Fig. 6, *c f*, *c g*, and *c h* being the only ones required for use, so that, in fact, the only lines we need draw are *c f*, *f g*, *c g*, *g h*, and *c h*.

THE SCIENCE AND ART DEPARTMENT.

THE expenditure and estimates of the Department of Science and Art for the present year have been published as a Government return. The corresponding figures are also given for the five previous years.

Under the head of aid to science instruction is set down an expenditure of £101,175, of which £88,000 is payment on results and £5,800 prizes and scholarships. The expenditure has risen continuously since 1882-3, when it was £59,686; and since last year it has risen by more than £20,000. The sum expended on instruction in art, £48,725 (£41,000 for results), does not show as rapid an increase as that for science. In

1882-3 the sum was £32,275, and last year £49,622 ; so that this year there is a slight decrease. To this must be added £5,345 for the National Art Training Schools, which cost only £4,641 five years ago. Grants for drawing in elementary schools are set down separately from art instruction and under this head we find this year £55,800 expended, as against £36,068 in 1882-3.

The museum at South Kensington, and its branch at Bethnal-green, expended £77,196, a sum rather below the average of the five years. While the expenditure on staff, which is now £57,196, has continuously increased, the sum of £2,000 devoted to purchases is the lowest sum in any of the six years.

The estimate on expenditure on the museum in Edinburgh, the museum, library, and botanic gardens and the Royal College of Science in Dublin, the geological museum in Jermyn-street, the Geological Survey of the United Kingdom, the Royal Hibernian Academy, the Solar Physics Committee. and local museums, was £54,212 five years ago, and it has risen to £60,047 in the current year. No sum is taken for aid to local museums in the current estimates.

The totals of all these items amount to £279,537 in 1882-3 and advance by continuous steps to £363,435 in the current year. The whole expenditure of the Department, however, rose from £347,625 to £438,558 in the same space of time. The difference between these several sums, year by year, represents the cost of administration, which rose from £67,588 to £75,123. It will be seen that the cost of administration has risen at a much slower rate than the grants administrated, for during the past six years the expenditure has increased 30 per cent., while the cost of administration has increased by only 11 per cent.

BUILDING MATERIALS.—II.*

By W. Y. Dent, F.C.S., F.I.C.

(*Continued from p.* 240.)

THE materials that come under the designation of stone as used for building purposes, consist either of the rocks belonging to the earlier geological formations (such as the various descriptions of granite), or of deposits that are the result of the decomposition of such formations, as represented by those that are of a sedimentary character. These sedimentary rocks may be classed under two heads —sandstones and limestones—some of them partaking of the nature of both, such as the Mansfield redstone, which is a silicious magnesian limestone. Of the sandstones there are a great variety, some of them being of too hard and too coarse a texture to be available for buildings the character of which necessarily entails a considerable amount of ornamental work, but they afford excellent material for plain heavy masonry, where strength and durability are the main points to be considered. We have examples of such material in the grey sandstones of Dundee and Arbroath, which have been much used for paving in Edinburgh and Glasgow, and of the coarser varieties in that which is known as Bramley Fall stone, used for Kirkstall Abbey, built in the 12th century, the name being derived from the quarry in the neighbourhood of Leeds, whence this description of stone was first obtained. This quarry has been closed for some time, but the original name is retained, and now represents a quartzose sandstone, varying considerably in its texture, belonging to the millstone grit formation, and obtainable in very large blocks from a number of quarries in Yorkshire, ancashire, and Derbyshire. It is chiefly used or engineering works, such as engine beds, dock walls, and foundations, being especially adapted for massive work of every description where large blocks are required. The finer descriptions of sandstone come under the designation of "Freestone," a term that has no very distinctive meaning, but one which is commonly employed when speaking of any stone, whether it be a sandstone or a limestone, that is capable of being easily tooled, quite irrespective of its chemical composition. There is an ample supply of excellent sandstone for general building purposes both in England and Scotland. In England this is especially the case as regards the counties of Lancashire, Yorkshire, and Derbyshire, in which there are a number of quarries yielding a very durable material, which is, at the same time, sufficiently soft to admit of being easily worked with a chisel. The stone from the Darley Dale and Knabb quarries, in Derbyshire, has been largely used in Manchester, and it would not be easy to find a better test of the durability of stone than subjecting it to the influence of such an atmosphere as that of the city of Manchester. The New Stanton and Coxbench quarries yield an excellent material for building purposes, some of the stone from New Stanton being also suitable for grindstones. Of the Yorkshire sandstones, amongst those that have been longest known may be mentioned the Hare Hills and Park Spring stone, which have been extensively employed for many years in London and in various parts of the country. The Scotgate Ash quarries, near Pately Bridge, yield an excellent building stone, some of the beds affording a material suitable for landings. A fine grained sandstone is obtained near Sheffield, which has few rivals as regards its properties as a grindstone, and in the district which lies between Bradford and Halifax are obtained in large quantities the flagstones for which Yorkshire possesses such a high reputation. The red Corsehill stone from Annan, in Dumfries, is one of finest of our red building stones. It is uniform in its texture, of a rich deep red colour, which is but little liable to alteration. This stone is peculiarly adapted for use in conjunction with bricks or terracotta, and has been employed with good effect for several buildings in London and its neighbourhood. One of the finest sandstones is that known as the Craigleith stone, which has been very extensively used in Edinburgh. It is a close-grained compact stone, consisting almost entirely of silica, the particles of quartz sand being bound together by a silicious cement, the total quantity of silica it contains, as shown by analysis, amounting to 98 per cent. The permanent character of this stone has been thoroughly established ; exposure to the weather for 200 years having in some cases scarcely produced any effect upon it, but it is questionable, however, whether the stone now obtainable under the name possesses the excellent properties of the original supplies. The Minera stone from near Wrexham, in Denbighshire, has been largely used in Liverpool and Manchester, and was employed in London for the building near the Mansion House occupied by the National Safe Deposit Company. At Grinshill, near Shrewsbury, there are quarries which yield a fine-grained building stone, of which there are three varieties, white, yellow, and red, which has been extensively used in Liverpool, Manchester, and Birmingham, and towns in the Midland Counties, as well as in London. This stone was employed for many of the churches in Shropshire, including Battle Church, standing on Shrewsbury battle-field, and has proved to be a good weather stone. The Prudham stone, from the neighbourhood of Newcastle, has within the last two or three years been introduced into London, and from the condition of this stone, which was employed for buildings in Woolwich Dockyard some forty years ago, it may (if obtained from the same beds) be expected to prove a durable stone. Uniformity of texture is an important consideration, more especially as regards sandstones, inasmuch as some of this class contain portions differing in character from the mass of the stone, showing a tendency to weather at a different rate. Sometimes such portions are less liable to alter than the mass, and are thus left as excrescences, whilst in other cases they weather more rapidly, and the stone presents a more or less pitted appearance. Limestones, as a class, are quite equal in importance to the sandstones as regards the number and variety of the beds yielding an excellent material for building purposes. They differ widely from each other as regards their chemical composition, from white marble, which is pure carbonate of lime, to the magnesian limestone, in some descriptions of which the proportion of carbonate of magnesia is nearly equal to that of the carbonate of lime. Marble is generally regarded as the result of carbonate of lime having been subjected to intense heat in a confined space, where there was no opportunity for the escape of the carbonic acid, and consequently under great pressure. It is a highly crystallised carbonate of lime, of a density equal to that of granite, weighing about 170lb. per cubic foot. Although we have not in England the beautiful white statuary marble of Italy, nor such deposits as would be required for a cathedral like that of Milan, yet we have in Derbyshire and Devonshire marbles that leave little to be desired as a material for ornamental and decorative work. The beautiful black marble from Ashford, in Derbyshire, has been worked for forty years, the beds varying in thickness from 3in. to 9in. It has been extensively used for ornamental work in church buildings and public edifices, of which we have an example in the bases and caps of the balustrading round the ladies' gallery of St. George's Hall, Liverpool. The other varieties of marble from these quarries, as well as those from Hopton Wood, in Derbyshire, have been largely employed for ecclesiastical as well as other decorative work throughout the country. The Devonshire marble can be procured in very large blocks, and to such an extent is this the case that a polished marble tank, weighing when finished nine tons, cut out of a single block, has been supplied from the Oreston quarries near Plymouth. The marble columns at the Home and Colonial Offices were also obtained from these quarries. There are several other limestones that are of such a highly crystalline character as almost to entitle them to be classed with marbles, of which the Niddersdale limestone may be taken as an example. By far the larger portion of the limestone ordinarily used for general building purposes is derived from the beds of the oolitic system, so named from the particles of some varieties of these beds being more or less of a granular character, bearing a resemblance to the roe of a fish. This appearance is not of a marked character in many of the stones belonging to the oolitic series ; but in some of the beds of Bath stone, and more particularly in the Ketton stone, it is too evident to escape the notice of the most casual observer. It is supposed that this appearance is due to the stone having been formed from the disintegrated particles of former limestones which have become rounded by attrition and deposited in a granular condition, or the carbonate of lime has been deposited upon some particle of sand or fragment of shell which was kept in motion by flowing water saturated with carbonate of lime. Such a production of oolitic grains may be observed in process of formation in the springs of Carlsbad. The most important of the building stones belonging to the Oolitic system is undoubtedly that which is known as Portland stone, which may be regarded as the type of a good limestone for ordinary building purposes. It has been used more extensively than any other description for the public buildings of London. St. Paul's Cathedral, Somerset House, the National Gallery, the Custom House, the Post-Office, the Royal Exchange, and the new Law Courts have all been built of this material, and experience has proved that (when carefully selected) it is one of the best adapted for resisting exposure to the baleful influence of a town atmosphere. Fortunately for its reputation, great care has generally been exercised in preventing any inferior stone being employed. Sir Christopher Wren had the stone for St. Paul's Cathedral quarried and exposed to the air for three years before it was brought to London, a full opportunity being thus afforded for rejecting any blocks that exhibited signs of inferiority ; the stone used for the Royal Exchange also underwent a special inspection at the quarries. There are numerous quarries in the island of Portland, and a series of beds, only a few of which yield a really good material. Taking the Waycraft quarry as an example, we find that after sinking to a depth of 25ft. through several strata of but little value, and known by various local names, the Roach bed, 2ft. 6in. in thickness, is reached. The stone of this bed is shelly and full of cavities, and consequently cannot be used for building purposes where a good facing stone is required ; it is, however, hard and durable, and is employed for underground work, its money value not being more than about one half of that of the best Portland stone. Below this is the finest bed of the whole series, known as the Whit bed, 9ft. 6in. in thickness ; and after sinking 8ft. deeper, through stone of little value, termed "curf," the lowest of the series, or base-bed, is reached,

* Being the Cantor Lecture delivered before the Society of Arts.

a name that has sometimes been converted into "best bed," which is somewhat misleading, inasmuch as, although sometimes preferred by masons, it differs slightly in its character from the Whit bed, and is considered inferior to it in durability. It also sometimes contains irregular bands of flint. The thickness of the several beds varies considerably in different quarries. This stone contains 95 per. cent. of carbonate of lime, the hard crystalline particles of which it is composed, as well as the material that binds them together, consisting of carbonate of lime. The next stone in importance belonging to the oolitic system is that obtained from several quarries in the neighbourhood of Bath, with which everyone is more or less familiar under the name of Bath stone. The several beds vary as regards the character of the stone they yield, perhaps to a greater extent than is the case with any other description, and unless great care is taken in its selection, it will generally be found to prove a failure if exposed to such an atmosphere as that of London. At the same time, examples are not wanting of its exhibiting as much durability as other descriptions of limestone, and in one instance, where it has been used along with Portland stone in the same building, in which special care was taken in its selection, it exhibits fewer indications of decay than the Portland. The vast trade that is now carried on in Bath stone may be said almost to have commenced with the opening of the Great Western railway, although the stone has for a long time been a favourite with builders, having been employed since the twelfth century. The stone imported from Caen, in Normandy, was introduced into this country shortly after the Norman Conquest, and was extensively used in building churches down to the middle of the 15th century. Its fine, soft, even texture renders it peculiarly suitable for ornamental work, and there is no better stone for internal decorations involving elaborate carvings. It is not, however, a good stone as regards its capability of resisting the effects of exposure to atmospheric influences, and is quite unsuitable for the exterior of buildings erected in large towns. With but few exceptions, when exposed to a town atmosphere, it has proved a complete failure, its defective condition having had, in some instances, to be concealed by paint. The Doulting stone, obtained from the beds of the lower oolite formation at the base of the Mendip Hills, in Somersetshire, resembles Portland as regards its composition, and also with respect to its density and porosity; and although it more resembles Bath stone in appearance it is superior to it in quality. This stone was used for building Glastonbury Abbey, in the 12th century, and for Wells Cathedral. Amongst other stones belonging to the same class may be mentioned the Ancaster stone, from near Grantham in Lincolnshire, which has been largely used in that and the neighbouring counties, and to some extent in London. The stone from Casterton in Rutlandshire was used for the cathedrals of Norwich and Ely, and in building some of the colleges at Cambridge. The Clipsham stone, from the same county, was employed in the restoration of the cathedrals of Ely and Peterborough, and is similar to what was formerly known as the Barnack stone, which acquired considerable reputation as a good weather stone. The Ketton stone, from near Stamford, has already been alluded to as possessing a very marked granular appearance, exhibiting its oolitic character to an unusual extent. It is a very excellent stone (of which we have a good example in the church of St. Dunstan's, Fleet-street), and is somewhat peculiar in that it possesses but little, if any, distinctive line of bedding. The Headington stone, from the neighbourhood of Oxford, has been largely employed for many of the colleges and churches in that city, the condition of which does not afford any favourable evidence for the durability of the Oxford oolites, much of the stone of the colleges and other buildings in Oxford exhibiting signs of exfoliation and decay. One of the better class of the Oxford oolites is the Charlbury stone, used for the Central Barracks, Oxford. A stone has been largely employed in Oxford for several years past which is obtained from Milton, near Chipping Norton; it has acquired a favourable reputation with several well-known architects, and seems likely to prove more durable than most of the stone that has been generally used for the colleges at Oxford. The stone which is known by three different names—Tisbury, Chilmark, and Wardour—is obtained from quarries in the neighbourhood of Salisbury, the original Tisbury quarry being now closed. It differs in its composition from the limestones before mentioned, inasmuch as it contains 10 per cent. of silica, which partly exists in minute particles forming nuclei, round which carbonate of lime has been deposited, and partly as a crystalline matrix, forming the binding material of the stone. Salisbury Cathedral was built of this stone, and it is now being used for the repairs of Westminster Abbey. The Kentish rag is a dense, hard, and very durable limestone belonging to the greensand formation, largely employed in the south of England for forts and harbours. It is obtained from quarries in the neighbourhood of Maidstone, where it occurs in layers from 6in. to 2ft. in thickness, with alternating bands of a soft silicious limestone, locally termed hassock; it is employed for many of the picturesque country churches in Kent, the hassock being used for the interior portion of the walls. Of the silicious limestones, the finest example is that known as the Mansfield stone, of which there are two varieties, the white and the red, both of which contain nearly 50 per cent. of silica, associated with variable quantities of carbonate of lime and carbonate of magnesia. This stone, more particularly the red variety, has deservedly obtained a high reputation for the beauty and uniformity of its colour, and the fineness of its texture. The magnesian limestone, or dolomite, as it is sometimes called, has obtained a not very enviable notoriety from its having been selected for the Houses of Parliament at Westminster. The name dolomite belongs properly to a mineral of a peculiar granular and crystalline structure known as bitter-spar, which consists of fifty-four parts of carbonate of lime and forty-six parts of carbonate of magnesia, the name being derived from that of a French geologist who discovered it in the Alps. The magnesian limestones are very variable in their character, both as regards their chemical composition and their physical structure. The magnesian limestone used for building is chiefly obtained in this country from the counties of Nottinghamshire and Yorkshire, in the district which lies between Mansfield and Chesterfield, stretching in a northern direction as far as Tadcaster. The quarries in the neighbourhood of Tadcaster were known to the Romans, who employed this description of stone in the construction of the multangular tower, the ruins of which, in the Museum-gardens at York, are still an object of interest. York Cathedral, erected in the 13th century, Ripon Minster, as well as many of the churches in York, are built of this stone, in many of which the signs of exfoliation and decay are but too evident.

(*To be continued.*)

THE ANATOMY OF PATTERN.*

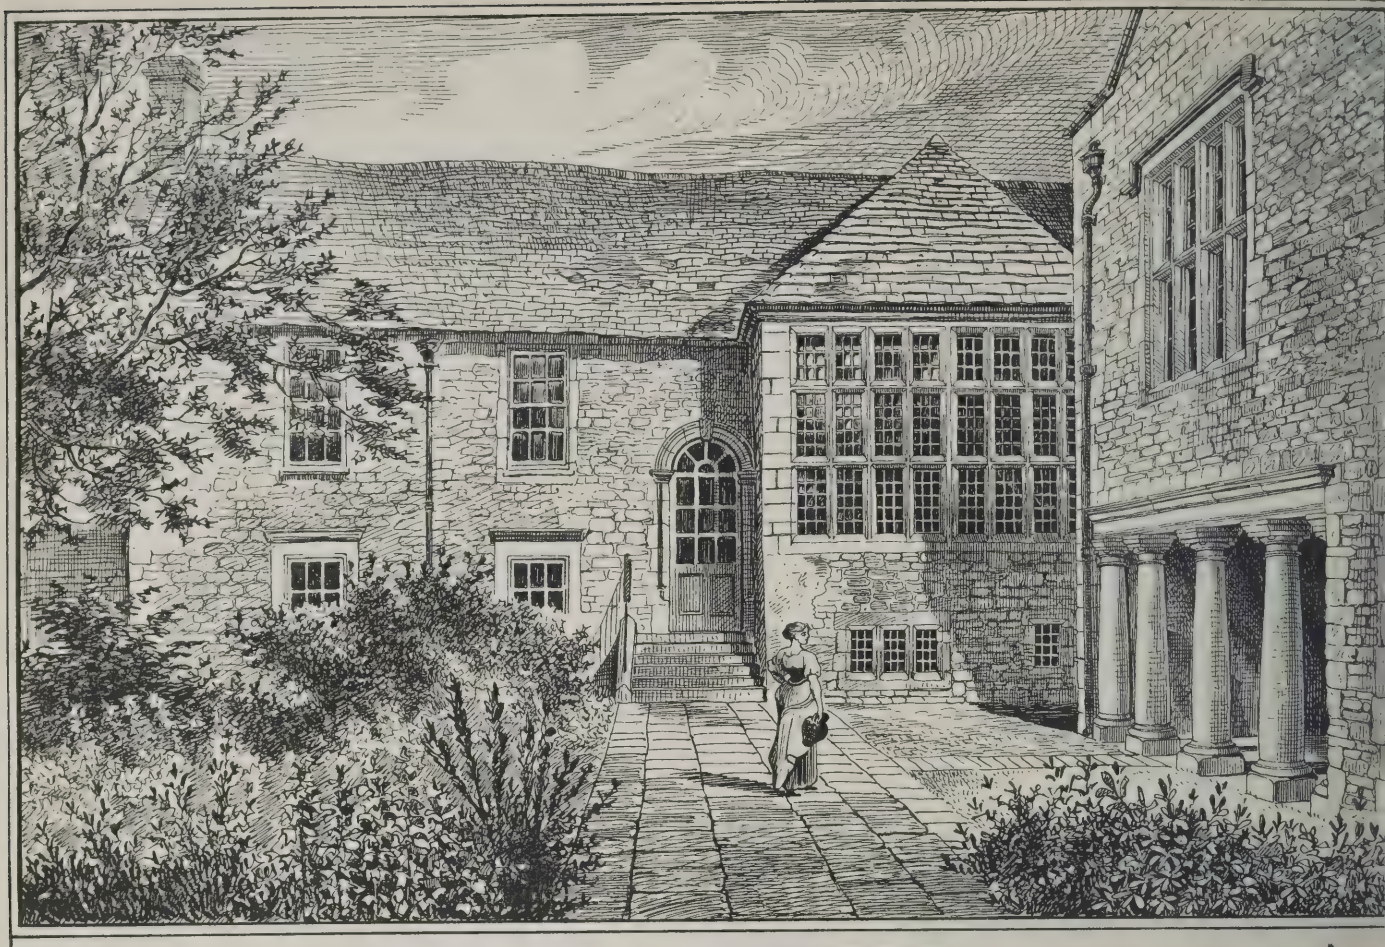
A SERVICEABLE little text book of ornamental design, under the above heading, by Mr. Lewis F. Day, whose essays on art are well known, will be read with instruction by students. This little book is one of a series in which the author has amplified the Cantor Lectures delivered by him before the Society of Arts last December. The book is well illustrated by thirty-five plates or diagrams of Gothic tracery patterns, checks founded on the square frets, and a variety of patterns, in all of which Mr. Day has classified and analysed patterns according to the principle involved in their construction. The chapter on pattern dissection is full of suggestion. Thus we have patterns constructed upon cross lines; of these are checks, lattice, plaids, frets, and a great variety of ornamental diapers. The cross lines may be varied, or may not even appear, but still a great many patterns are made so that they fall within the lines. The diapers constructed on the equilateral triangle are numerous and varied. The frets and interlacings are all produced upon cross lines, and the diapers based on bisecting the square lattice forming triangular forms, develop an immense variety of very pleasing ornament suitable for surfaces. Plates 6, 7, 8, 9 are well worth study. The student will soon discover what a wealth of suggestion he has in the square lattice when placed either on the square or diamond-wise, and crossed by a series of lines bisecting the angles. In both cases the diaper is one of triangles. The equilateral triangle is most fruitful in designs. If we group them together we have the hexagon of six triangles, and an infinite variety of star diapers. Byzantine and other Oriental patterns are made up largely from the triangle. The octagon in like manner is derived from the square crossed diagonally, and many beautiful patterns are constructed upon it. Many of the most obvious of these are illustrated. In connection with the square the octagon will repeat. Several intricate Arab interlacings and lattice patterns are shown in Plate 10, based upon squares, octagons, and hexagons. The author in each case shows by dotted lines the construction of the diaper. It is remarkable what a variety of intricate patterns can be evolved from these simple geometric figures and the lines of radiation. After the straight-lined family of patterns the author treats of those founded on the circle; in this class we have wave diapers and a variety of curvilinear patterns. The intersecting circle is one of the most useful groundworks of ornament. Mr. Day has shown clearly by these examples that all patterns are based on geometric forms of the simplest kind, so that the designer who desires to invent patterns ought to be familiar with simple methods, and ones that can be easily worked. The examples of silks, damasks, wallpapers, tile patterns, and various textiles are well selected, and the book is a valuable introduction to every student of ornamental design.

* The Anatomy of Pattern. By LEWIS F. DAY. London: B. T. Batsford.

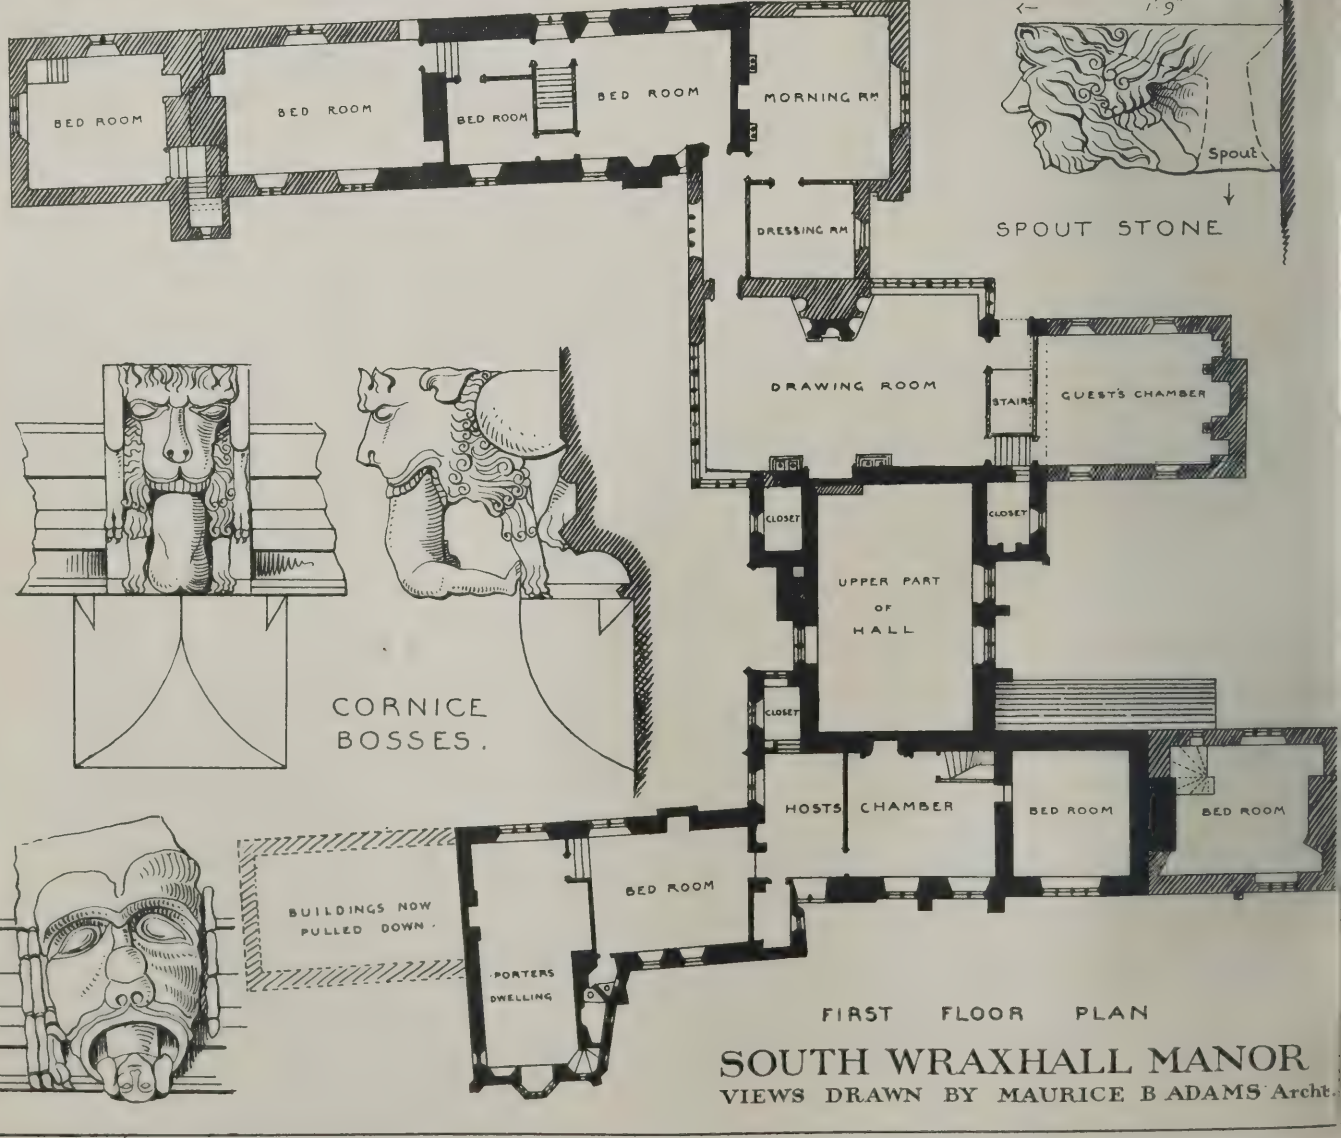
GLASGOW ARCHITECTURAL ASSOCIATION—ANNUAL EXCURSION.

ON the evening of Thursday, the 14th ult., a small party left Glasgow for Liverpool as the first annual excursion under the auspices of the Glasgow Architectural Association. It had been at one time intended that the tour should be made in a district of Yorkshire; but as the result of a meeting among those who purposed going, it was ultimately decided to travel in Cheshire. At Liverpool some of the public buildings were visited, including, of course, St. George's Hall, also some of the new buildings in the suburbs. A visit was paid to the Walker Art Gallery, where were viewed the drawings in the Liverpool Cathedral Competition. A forenoon train, on Saturday, was taken to Speke station, and a short walk brought the party to Speke Hall, admission and permission to sketch being kindly granted by the proprietrix. This is one of the most interesting of the old timber halls which are so characteristic of the district. The interior wood and plaster work is especially rich, and the house contains some fine old furniture. The party that night proceeded to Chester. While there they owed much to the kindness of Mr. Lockwood, architect, and Mr. Beswick, his chief assistant. The latter gentleman accompanied the members round the city, pointing out the principal features of archæological interest, the crypts, the Roman hypocaust and columns; the remains, Roman and Mediæval, at the new Grosvenor Museum; St. Mary's Church, of the Perpendicular period, and the fine Norman and Transition church of St. John, at present undergoing restoration at the hands of Messrs. Douglas and Fordham. The Cathedral also was visited, under the guidance of Mr. Beswick, who gave the members much interesting information regarding the building. The south transept is now being restored by Mr. Blomfield. Sketching was engaged in by all the members at the Cathedral; also at Stanley House, houses in Bridge-street and Whitefriars, St. John's Church, &c., and a few photographs were taken. Not only the old but much of the modern work is of great interest to architectural students, several examples by Douglas, Lockwood, and Ould being particularly admired. Leaving Chester, Nantwich was visited. Here there is some half-timber; but the salient feature of interest is the church, with its fine stone pulpit and octagonal central tower. At Sandbach there is a good timber hall and a Per-

pendicular church, restored by Sir Gilbert Scott. From Congleton, Astbury Church and Moreton Hall were reached. Moreton Hall, it need hardly be said, is one of the very finest examples in the district. At Sawsworth there is an interesting Perpendicular church with fine wood roof; also a good half-timber hall. Circumstances proved unfavourable to the viewing of the interior of Adlington Hall, which is understood to be very fine; but at Bramhall the party was conducted over the house by the proprietor, who is now restoring it very thoroughly. Some interesting coloured decorations have just been laid bare. A look over some of the public buildings of Manchester and the Exhibition closed the tour, which will, it is hoped, form a regularly recurring feature of the Glasgow Association's studies.



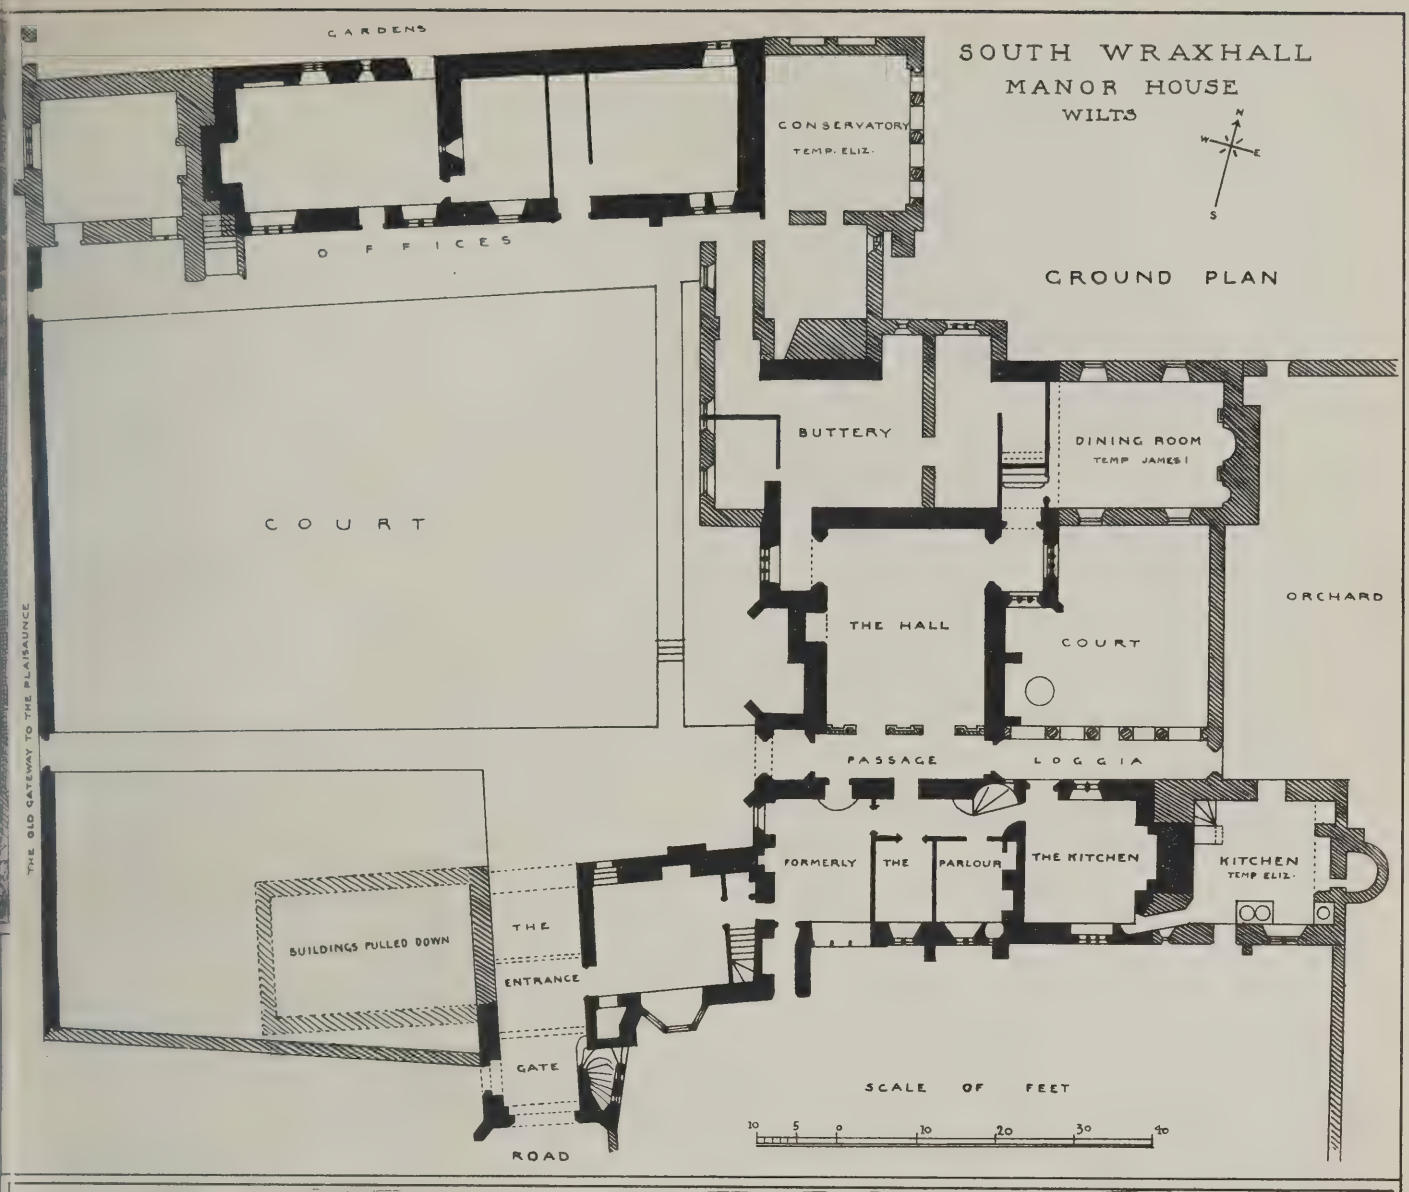
A NEW ROAD PAVEMENT.



ALTHOUGH, says the *English Mechanic*, many attempts have been made to discover a thoroughly satisfactory road pavement, it is well known that none of the modern devices altogether supplies what is required, for wood, which is the most promising material, and has been tried in various ways, is certainly not all that could be wished; it wears quickly and unevenly, and in wet weather the mud is splashed up in an unpleasant manner upon foot passengers from its absorbent surface, while asphalte is at once the bugbear of drivers and owners of horses, however much it may be praised for its noiselessness by those who transact their business in streets which are paved with it. Granite sets are universally discredited, and macadam is really out of place in any city where there is much traffic, and the rainfall cannot be regulated to suit the roads. Some years ago —at least a quarter of a century—the eastern end of Leadenhall-street, near Aldgate Pump, was laid with cast-iron "honeycombs," the interstices of which were filled with grouting; but this pavement, excellent in some respects, was found too noisy, and, above all, too dangerous to such horses as happened to fall on it, for the iron ridges cut into the flesh of the horses that fell, and the pavement was speedily condemned and taken up. A somewhat similar pavement, with, however, a great difference, has recently been patented, and is likely to come into extensive use in busy streets, for it is based on a scientific principle, and meets all the requirements in a scientific manner. The idea has been taken from the elephant's tooth, which, as it wears, always presents a rough surface, in consequence of the vertical layers of hard substance intermingled with the soft remaining above the latter. In the new road pavement the hard layers are represented by Portland cement, the soft by a mixture of sand and cement, and the surface continuously presented to the feet of the horses is consequently one on which there is excellent foothold, while the resistance to traction is little more than that of asphalte. This method of making road pavement has been patented by Mr. A. C. Ranyard, F.R.A.S. The "sets" consist of "blocks" of alternate layers of hard and soft material, which are so laid on the road that the edges of the laminæ form the wearing surface. In consequence of the unequal abrasion, the surface will always expose a series of ridges of slight elevation—not sufficient to cause jolting in carriages, while securing ample foothold for horses—and, as the material can be laid down in large blocks, and will probably last longer than any of the ordinary pavements, it will have an additional recommendation, for as most tradesmen know, "road up" means little business. The granite blocks require to be taken up when their surface has worn smooth, and though they may be turned over and the other side used, this means a stoppage of business; but the elephant-tooth blocks wear rough as they wear down, and may, it is thought, be used until they are more than half worn through, a process which would occupy a long time, as they are 4in. thick, and very hard when set for three or four months. It is calculated that the blocks will wear at least ten or twelve times as long as granite pitching. The layers of cement and mixture are respectively a quarter of an inch and three-quarters of an inch thick, which give blocks having ridges at such a distance apart that no jolting is experienced in carriage traffic, while the foothold for the horses is perfect, and when the blocks are properly "seasoned" the ridges of pure Portland cement are really harder or tougher than granite itself. The new pavement has been tried experimentally for stables, and is now undergoing the severe test of a gateway entrance where heavy waggons pass frequently; but it will be readily understood that the principle being sound, it is simply a question of cost, to what extent the new pavement will be adopted. Practically it presents that paradox which is the coachman's delight—a rough-smooth surface, that is, rough enough to give a secure foothold to the horses' feet, and yet so smooth that it does not jolt the carriage, nor offer much resistance to traction. As the wear will in all probability be very little, the surfaces of the roads will be comparatively free from mud or dust.

ARCHITECTURAL ASSOCIATION EXCURSION, 1887, WILTS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]



ON Monday the programme opened with a visit to the terraces at Claverton, with the adjoining church and old farm buildings. The former constitute all that remains of the once famous mansion of the Dassets, whose history tells us of their seat being besieged and taken by the Parliamentary party during the Civil War. The open balustrades of pierced stone of uniform design throughout are perhaps too thin to be worthy of imitation; but their general effect, when backed by the gabled house, must have been exceedingly dignified, and the terraces considerably enhanced the importance of the elevation. The piers to the entrance have pierced finials of good character, and the ramping balustrades are happily treated. Defence against military attack of course was not thought of in the planning of these gardens. Jeffrey Wyattville rebuilt the house at Claverton on the top of the hill, but his work here is devoid of interest; and so also is the church, which was reconstructed in 1858. Ralph Allen, the stone quarry owner who erected Prior Park as an advertisement for Bath stone, lies buried in the churchyard under a monstrous inclosure terminating in a great square pyramid. He died in 1766. His house at Prior Park, near Bath, is a dismal piece of building, the work of an architect named Woods, who wrote a book describing his own works under the title of "The Beauties of Bath." It is faced by a great pediment and portico of poor design and indifferent proportions. The building is charmingly situated, and is memorable in connection with "Tom Jones" and Pope, who finished the "Dunciad" there in 1741. The farm buildings at Claverton, like much of the old Domestic work in the neighbourhood of Bath, much resemble Northamptonshire buildings with their simple gables, mullioned windows, and square built chimney shafts. The roofs are, for the most part, covered with stone slabs, and their harmony of colour with the weather-stained masonry of the walls often furnishes the leading charm of their unpretentious architecture. Mr. Wallace Gill, of Bath, briefly described Hinton Abbey, where a most interesting chapel remains almost in a perfect condition, having a groined roof, with rooms over and adjoining it. The other existing part of this old Carthusian Monastery, the first built in England, comprises the building known as "The Refectory," but its proper designation seems to be an open question. The foundation dates from 1227, and the dedication of the Abbey is in honour of the Blessed Virgin Mary, St. John Baptist, and All Saints. Next week we shall publish some measured drawings of the chapel buildings, and will then give other particulars concerning it. The builders were the monks of Witham Friary, which was situated some 12 miles distance from "Hynton," as the place in old days was called, and Ela, Countess of Salisbury, wife of William Longespée, founded it. Hinton House hard by was constructed out of the Abbey ruins in Tudor times, but has modern additions of a characterless type which spoil its façades. The manor house and church at Hinton Charterhouse lack interest. Farleigh Castle is a ruin very beautifully situated above a vast ravine, the well wooded slopes of which, rising from the banks of the Frome, are called, from some antique tradition, the "Danes' Ditch." For 300 years Farleigh was the stronghold of the wonderful family of the Hungerfords, whose glory closed in a story of shame and reckless dissipation in the days of Charles II., at whose dissolute Court Sir Edward Hungerford wasted his substance and fortune. Canon Jackson has written a book of great interest on the history of the place, with plans of the castle restored; but to the architect there remains nothing of special interest. Mr. J. Alfred Gotch read some spirited notes on the ruins, adorning his tale by delicate allusions to the weaknesses of our ancient aristocracy. The Hungerfords associated their interests with the Lancasters in the Wars of the Roses, and, in that cause, sacrificed many of their heads and much of their estates. The chapel within the castle walls was used as a parish church; but, in Grose's time was nearly roofless; while in 1779, when it belonged to the Houltons, who purchased the property in 1730, the sacred edifice was repaired, and again in 1806. Its restoration, however, to its original purpose seems never to have been realised, and the chapel has for very many years been only used as a museum containing a miscellaneous assortment of curiosities, such as sheet armour, jack boots, stirrups, spears, and swords, together with a made-up pulpit, a reredos in Jacobean woodwork, some contemporary chairs, chests, and settles. The family coat of arms and badge of three sickles are ingeniously introduced into the seats and roof of the building, which itself is mainly of Perpendicular design. The altar slab is of pudding-stone. Driving off again after luncheon, the party next visited Norton St. Philip, where the old George's Hostelry is the most notable object of interest to the architect. We give herewith a view of this quaint old building, which is situated in Somersetshire, just beyond the borders of Wilts. A great Cloth Fair once was held here, and the merchants met in the large upper room of the George. Its date is 15th century, and was built as the Grange of the Prior of Hinton. Parker, in his "Domestic Architecture of the Middle Ages," gives some drawings and details of the house. The substructure is entirely of masonry, the upper part in front being in oak constructed half-timber work. The stone-built and cusped bay windows on the ground floor add greatly to the façade, and the great doorway in the centre leads through to the rear buildings, where there is an octagonal stair turret, and a series of cusped-headed windows, now nearly all blocked up. The braced roof of the house is of good design; but sadly needs repair. Inside the house there is not much remaining of note, save a fine wrought-iron firegrate, with a swinging pot bracket of good design, sketched by several of the party. The farmhouse below the village is over-windowed with projecting moulded mullions, a style peculiar to this district. There is at the back of the house an ancient square built and gabled dovecote; the walls are 2ft. 4in. thick, and the pigeon-holes are 16in. deep. The church in some respects is a fine one; but has a coarse western tower, the portal of which furnishes its most interesting detail. This projects from the main wall to the face of the west buttresses, and so forms a porch, which has a traceried ceiling all of stone, and some boldly carved spandrels. Sir Gilbert Scott restored the church in 1847, and it contains some very poor woodwork from his designs. The windows are filled with indifferent glass, added at various times since Scott finished his restoration. With Wellow Church the day's proceedings closed. In the village street a house, now occupied by a farmer, contains a richly-panelled room, having a richly-carved oak chimneypiece, and the doors of the apartment are surmounted by a frieze and scroll terminal corresponding in design, of Elizabethan or rather later date. The work seems never to have been painted, and its detail is refined and well executed. The church, which is of pronounced Somersetshire type, may be described as a fine one, with a bold western tower of good proportions. The fabric was restored in 1845, and the grand roof of the nave has been carefully renovated. Mr. W. Gill lately repaired the old roof of the north aisle and the chapel at the east end, now occupied by the organ. The church is furnished with old seats with poppy-heads of ugly character. There are some Jacobean wall and other monuments,

SOUTH WRAXHALL MANOR

VIEWS DRAWN BY MAURICE B ADAMS Archt.

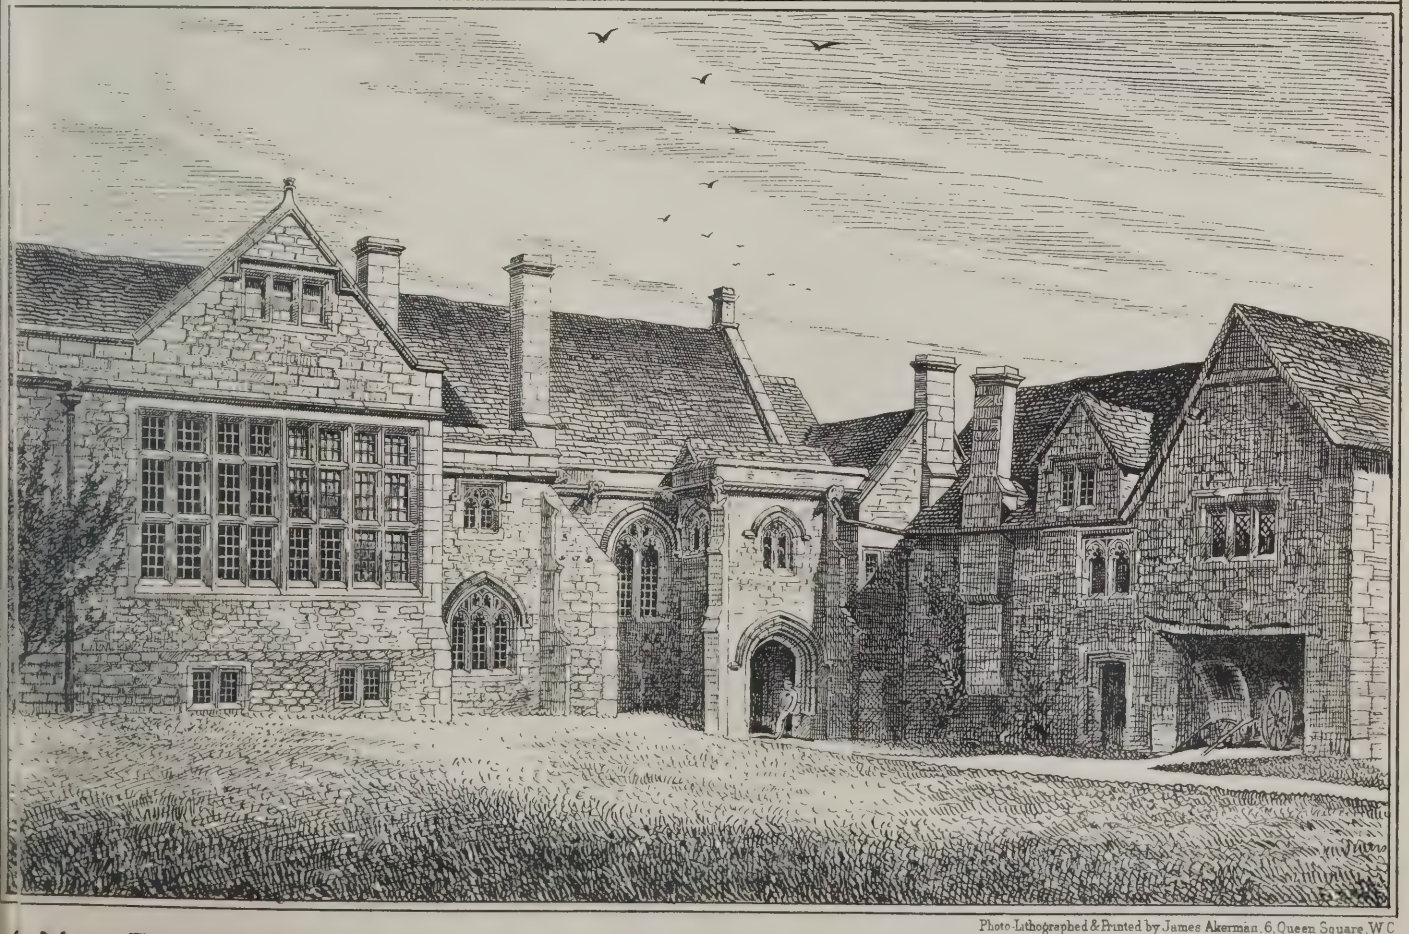


Photo-Lithographed & Printed by James Akerman, 6, Queen Square, W.C.

ut neither of these are remarkable. First on he list of Tuesday's visits was Cheney Court Manor House, built by the Spekes during the eign of James I. There is nothing remark- ble about the fabric, but it may be described s typical of Old English architecture with imple straight gables, many windows, and ome wrought-iron work to the water-spouts. nside the house are two rather extravagant himneypieces Rococo in style, and conse- uently admired by the more extreme members f the party. Corsham Mansion, Church, and Almshouses afforded material for a stay of ome hours, and the excursionists were shown he grand collection of pictures which was be- ueathed by Sir Paul Methuen, the Spanish Ambassador, who died in 1757, to the ancestor f the present Lord Methuen, who lives at the Court House. These pictures form one of the ldest private collections in England, and com- rise works by Lely, Kneller, Dobson, C. Jan- ens, Vandyck, Riley, Reynolds, Gainsborough, Romney, and others. The house, which is f considerable size, is also a handsome ansion of Early English Renaissance haracter, with gables, high roofs, and himneys; but it is not very interesting s a specimen of architectural design. Nash, f Regent-street celebrity, rebuilt the north ront; but this subsequently was pulled down, nd Charles Bellamy was engaged to rebuild it, ogether with the grand staircase, over which e put a low, square tower forming a centre to he principal front as seen over the main roof. his architect's drawings for these alterations re in the library at the R.I.B.A.; but his xecuted work here is only of passing merit. he house contains some fine English and talian furniture. Mr. G. E. Street, R.A., re- ored the church and built a tower and spire o it, following the type of Wiltshire spires ound in parts of the country, that of Lacock ext seen affording one example, though some- ow the modern work in this case is hardly so tisfactory as the ancient one. The original ower was a central one, and probably was hifted in rebuilding for some good reason. The outh porch of the church at Corsham is teresting with some late additions on the east de of it in Jacobean taste. The nave arcades e Norman, and there are some Decorated indows; but the main portions are Perpen- cular in character, and of good design. The od-screen in stone to the north chapel is rried out with light wooden detail, including e fan vaulting over it. In the chancel is a rt of the ancient wooden screen decorated in lour, and now surmounted over a masonry all to screen off a vestry. There are several assical wall tablets in the church, and some e curiously inscribed. The Hungerfords, as riginal owners of the estate, are thus equently represented, and their virtues are re- unted for the benefit of posterity. The ungerford Almshouses, of which a view is iblished herewith, deservedly attracted a large mber of sketchers, and the woodwork of the apel was measured by not a few. In the UILDING NEWS for June 11, 1886, will be und a complete set of elevations to scale with plan and a sheet of details drawn by r. Fredk. M. Simpson, when Travelling udent of the Royal Academy. The staircase a good one, and in some respects the build- gs are unique, and seem very perfect. Their story was told when the above illustrations re given, with some account of Dame ungerford, who built them. Lacock Abbey cupies a picturesque site situated on the nks of the Avon, and without being in any se a grand house, is certainly most com- hensive in character, including work of the h-century date down to the so-called Gothic Batty Langley, who added the hall about middle of the last century. Lacock was unded by Ela, Countess of Salisbury, as an gustine nunnery in 1232, and shortly after- rds she entered the establishment as a nun, d was elected its abbess. Henry VIII. confis- ed Lacock in 1539, and bestowed it on Sir illiam Sherrington, who transformed the nnery into a house for himself. The church s pulled down, and many changes were de; but the house still retains a considerable t of its monastic features, the beautiful oister being specially interesting. The naissance octagonal tower built by Sher- gton in Edward VI.'s reign is a good mple of its kind with refined detail. The Elizabethan stable buildings, particularly as seen from the rear, group well with half-timbered dormers and bold chimneys. A plan of the abbey will be found illustrated in the BUILDING NEWS for Sept. 22, 1876. The Talbots received the estates by marriage from a daughter of Henry Sherrington, brother of Sir William, the builder, he having inherited it in consequence of no issue. Mr. Talbot, the present owner, received the party of excursionists, and explained every part of the house in detail, showing a large plan of the abbey as it stands. The village of Laycock is almost entirely built of stone, with here and there some half-timbered work, and the many gabled old houses furnish many a good subject for both brush and pencil. The church at Lacock, like the village, is comparatively unknown to architects; but it is a very interesting building in every way. The richly treated chapel on the north side of the chancel is uncommonly good, with beautiful carvings and high-pitched gables behind the embrasures of the decorated parapet. The east wall of the nave, over the chancel roof on the exterior, is masked by an elaborated arch-shaped parapet, cusped and trefoiled, containing beneath it a traceried window. There is a somewhat similar feature at St. Mary's Church, Devizes, but that is not so rich as this example. The south transept has a domestic building adjoining it in very Late Tudor, and this grouping, with the spire, forms at once a picture, with the charming old village street in the rear. There is some good plate in the church, and an Early ciborium, which was also shown the visitors. In the street is a house containing a panelled room, with a good piece of Jacobean woodwork over the fireplace. Passing Pickwick and Box on the way home to Bath, some pretentious buildings and houses lately erected in the stone of the county were noted as specimens of what to avoid, especially the "Gothic" house in the valley of Box-hill.

On Wednesday the day's work commenced by visiting the celebrated mansion of South Wraxhall, of which we now give plans and two views. A sketch of the drawing-room appeared in our pages last week, and we herewith add some particulars of the house. South Wraxhall, or the "litle maner at Wrexley," as Leland's Itinerary describes it, is the historic home of the Longes, and dates its records from the days of Etheldred. In general idea of plan the hall and offices very closely resemble Great Chalfield (seen on Thursday), so much so that one would almost imagine South Wraxhall, which is certainly the older of the two, served as a model for that building, although Chalfield was much larger. The hall at South Wraxhall has a fine hammer-beam roof, and it is 31ft. 8in. long, by 19ft. 9in. wide, and the drawing-room measures 35ft. 2in. by 15ft. 7in. The work is chiefly Tudor and Elizabethan in style, but parts are older, and this hall is the oldest portion of the house. The entrance-gateway, with porter's dwelling over it, seems to have been built at a somewhat later date. The oriel window to the room over the archway is rich, and the angle buttresses are effective and somewhat singular. A staircase within the wall on the right leads up to the room above, where there are some quaintly-arranged privy closets, and a fireplace adjoining the bay window is curiously situated. The chimneypiece in the hall bears the date of 1598, and is an interesting specimen finished with Elizabethan detail. The drawing-room is more strictly in the style of James I., and the chimneypiece is a singularly dignified example of the time with purer enrichments than is usual in work of this date. A male and a female figure, with Ionic caps, on each side, support a very handsome cornice, which is surmounted by a stylobate, whereon are placed columns and entablature of the Corinthian order; between the columns, which are also enriched, are figures of Prudence, Arithmetic, Geometry, and Justice. On the pedestal supporting Arithmetica is the following inscription:—

"Par nuper numeris vestigo site subactis,
Me pete, concinne, si numerare cupis.

And on that supporting Geometria—

"Mensuras rerum spatiis dimetiora equis
Quid Cœlo distet Terra, locusque loco."

"Prudentia" and "Justitia" have no motto. In the centre is the figure of Pan. The view of this drawing-room, which we published last Friday, gives a very good idea of this rich apartment. The room was added by Sir Walter Long in 1600. Both plans which we publish herewith are correct to date, and were originally drawn by Pugin for his "Examples." The two sketches printed herewith are from photographs taken by Mr. Wilkinson, of Trowbridge, and show the exterior from two points of view. The upper sketch shows the side bay window of the drawing-room to the right. In front of the picture is drawn the colonnaded Elizabethan garden-house, or conservatory as it has been called. By the lower drawing a view is furnished of the principal front of the mansion. Some of the gargoyles or boss-stones to the exterior cornices are boldly carved with fancy and freedom, including monsters consuming men and "dragons of the deep." Bradford-on-Avon and Westwood concluded the proceedings on Wednesday. Next week, with further illustrations, we shall conclude our account of the places visited. Chalfield Magna, of which we give a view to-day, was seen on Thursday. The plan shows the character of the old house, which has been rudely modernised, so that in point of fact the front of the house is all that stands unaltered of the original building.

AMERICAN BRIDGES.

SPEED in bridge construction is one of the elements in American practice. Many structures on the Ohio and Mississippi Railway have been erected within remarkably short periods; one span of the Medora Bridge over the White River was erected by thirty-seven men in one day. This element of time is not a matter that weighs with us to the same degree. The system adopted in America of making a specification of the requirements, leaving to the contractors the mode of working out the design, is a procedure that has tended to expedite works, though not always with the best results. The United States method is much like asking architects to send in designs for a building not to exceed a certain amount; though there generally is a competent engineer or board of experts employed to examine the designs, and report on them. The specifications contain clauses on the tensile strain, usually stated as not less than 50,000lb. per square inch of sectional area; the limit of compressive strain allowed is not less than 25,000lb. per square inch. The total weight of structure is one of the things left to each contractor, though a certain weight per foot is allowed for various items above the floor beams. The maximum strains are specified—that for tension is usually put at 10,000lb. per square inch upon the bottom chord and main ties, in other members liable to receive sudden shocks or tension the strain is not to exceed 4,000lb. per square inch. Riveted work, pins, eye bars, wind braces, and floor beams are amongst the points particularly specified, and a clause on the tests required is appended.

These specifications are faulty in giving definite tests, which may be stood with iron of inferior ductility. Thus it has been shown that hard, brittle iron will stand the test well, and exhibit not the least sign of elongation; in this respect, it may be approved, instead of really tough iron. The clause for testing should clearly enforce a percentage of elongation or contraction of area with as much firmness as the breaking strain. In bridge construction the requirements of good iron cannot be proved by tensile strength merely; the members exposed to strain should be ductile as well. A bar with moderate tensile power, if ductile, is better than one of higher power that is brittle. So of other points. Though maximum strains are specified, they do not take into account the effect of sudden shocks. The same want of consideration for the accidental is shown in the details, and what was intended as a specification for a perfect structure is really only one under certain definite and assumed conditions.

"The very highest church in Europe," according to the *Bundner Tagblatt*, "is the pilgrimage chapel of St. Maria de Ziteit, above Salux, in the canton of Graubünden. It lies 2,434 mètres above the sea level—nearly 8,000ft. high, near the limits of perpetual snow. It is only open from St. John the Baptist's Day to St. Michael's Day."

CLAINES CHURCH, WORCESTER.—NEW CHANCEL, ST. MARY'S, HATFIELD.—THE HORNS TAVERN AND ASSEMBLY ROOMS, KENNINGTON.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

OUR LITHOGRAPHIC ILLUSTRATIONS.

CLAINES CHURCH, WORCESTER.

We gave a double-page illustration of the exterior of this church on the 8th ult., and described the building and the recent improvements and additions carried out from the designs of Mr. Aston Webb.

THE CHANCEL, CHURCH OF ST. MARY, HATFIELD, HERTS.

The church of St. Mary, Woodhill, in the parish of Hatfield, was erected in the year 1847, and terminated with a small apsidal chancel which was deemed to be inadequate to the requirements of the church. The new chancel, an illustration of which we give this week, was opened by the Archdeacon of St. Alban's, on April 13th, 1887. The walls are of brick, faced externally with Bath stone. The stained glass was executed by Mr. W. G. Rich, of Brentford. The reredos is in fine Bath-stone, with alabaster and coloured marbles for caps, bases, columns, super-altar, &c.; the groups in the three panels are in statuary marble, representing, in the centre, "The Adoration of the Magi," and on either side, "The Annunciation," and "The Nativity." On the north side of the chancel are a spacious vestry and an organ chamber. The church is heated by hot water on the high-pressure system by Mr. John Smeaton, of London. The general contract was taken by Mr. J. W. Falkner, builder, and the whole of the works were carried out from the designs and under the superintendence of the architect. Mr. H. Hardwicke Langston, of 9, Great James-street, Bedford-row, London.

THE HORNS TAVERN AND ASSEMBLY ROOMS, KENNINGTON.

No particulars are to hand in response to our application for them about this building. The architects are Messrs. Crickmay and Son, of 17, Parliament-street. The publichouse is already completed, and the premises adjoining are now erecting.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

For description see p. 280.

Joseph Winch, a builder, of Walthamstow, has been convicted at the Stratford-by-Bow Petty Sessions of having constructed two buildings of bad materials. It was stated that the bricks were soft and undersized, and that no mortar was used. He was fined £3, and ordered to pay £1 11s. costs.

A new board school in Ashwood-road, Parkgate, Rawmarsh, Yorks, was opened on Friday. It cost £2,300, and accommodates 310 children.

Under a bequest of the late Mr. Harvey Ham, to Christ Church, Frome, two new windows are being placed on the south side, one of which will be of stained glass. The stained and other glass will be supplied by Mr. E. Horwood; Mr. E. Whiting has undertaken the stonework; and Mr. W. G. Brown is the architect.

ST. MARGARET'S CHURCH, IPSWICH.

Our illustrations of the above are from part of a set which obtained a national silver medal at South Kensington last year for Mr. Harry Percy Adams, of Ipswich.

COMPETITIONS.

Board School Plans.—Mr. E. R. Robson, F.S.A., consulting architect to the Education Department, in preparing regulations as architectural assessor with regard to a competition for new Board schools at Tottenham, gave the following among other suggestions which may be regarded as semi-official:—(1) The technical definition of a class room is a room which does not hold more than sixty scholars. This is an old definition framed by the Department, and has not been altered to meet modern necessities. (2) Reckoning accommodation on plans the Department take 10sq.ft. superficial area for class rooms; but when a room is to provide for more than sixty, then it is reckoned by the accommodation shown on the plans. (3) Rooms other than class rooms (which would be technically called school rooms) must not exceed 20ft. in width. (4) As to desks, while there is no rule as to the adoption of dual desks or those 6ft. or 8ft. long—where dual desks are used, there need be no gangway at the back.

Scarborough.—The directors of the Constitutional Club, Scarborough, after having examined the designs sent in for the new club, have awarded as follows:—The first premium, 25 guineas, to Mr. Henry A. Cheers (Twickenham, London), the motto under which it was sent in being "Straight and True." Two second prizes of 10 guineas each have been given as under:—Mr. Arthur Bown (Harrogate) and Edward Dodgshun (Leeds), joint authors of the design "Union is Strength"; and to Messrs. Smith and Broderick (Hull), for the design "C.C." in monogram.

Stockport Technical School.—At a meeting of the executive committee of the Stockport Technical School, held last week, for the purpose of selecting the design for the new institution, 22 sets of plans were exhibited, two of the competitors having furnished alternative designs. The committee unanimously selected the design under the motto "Stet," the author being Mr. George Sedger, 26, Great James-street, Bedford Row, W.C.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

British Archæological Association.—The annual Congress of this association is being held this week at Liverpool, under the presidency of Sir James A. Picton, F.S.A. The first meeting was held in the Town Hall on Monday, when the president delivered his inaugural address. He remarked that the sphere of inquiries and observations during the Congress would principally lie in the vicinity of the estuary of the Mersey, which had been from the earliest ages the dividing line between two important districts. When the Romans first penetrated into this country the northern bank was occupied by the Brigantes, and the southern by the Cornavii, two of the most powerful Celtic tribes. Now, the first thing which struck them in reference to the history of the estuary was the fact that all the other rivers along the west coast—the Conway, the Lune, the Voryd (or Clwyd), the Dee, the Ribble—have Celtic or Cymric names. The Roman geographers, Ptolemy and Antoninus, gave these names in a Latinised form. The Mersey was not mentioned by them at all, and it had no Celtic name. They were drawn to the conclusion that subsequent to or during the latter part of the Roman dominion a serious change must have taken place in the physical features of the locality. The members subsequently visited St. George's Hall, and in the evening dined together. On Tuesday the members passed through the Mersey Tunnel to Birkenhead and visited the Old Priory in that town; Bidston, West Kirby, Thurstaston Hall (now the seat of Sir David Radcliffe), and the church at Woodchurch. In the evening a meeting was held at the Walker Art Gallery, where papers were read on "The Origin of Christianity in Wirral," by the rector of Wallasey (the Rev. E. P. Gray, M.A., F.S.A.); "The Connection between Wales and Cornwall during the 5th, 6th, and 7th Centuries," by the Rev. W. S. Lach Szyrma, vicar of Newlyn; and "Some Considerations relative to the Ground Plan and the Walls of Chester," by Mr. E. P. Loftus Brock, F.S.A. On Wednesday the members visited the Calderstone, Speke Hall, and Childwell Hall. Burscough Abbey, at which excavations have been made by Lord Derby, has also been visited, and to-day (Friday) Sir J. A. Picton has invited the members to a garden party at his residence, Sandy Knowe, Wavertree.

Cambrian Archæological Association.—The forty-second annual meeting of this association will be opened at Denbigh on Monday next. The president is Mr. J. T. Dillwyn Llewelyn, M.A., F.L.S., and the president-elect Mr. C. Salusbury Mainwaring. Among the places to be visited are Denbigh Castle, Burgess tower and walls, the Abbey, Penycloddian camp, Rhuddlw priory, castle, and church, Ruthin Church, cloisters, and castle, St. Asaph Cathedral, Ysgubor Newydd tumulus, and Cefn caves.

Sheffield Society of Architects and Surveyors.—A general meeting was held at the Sheffield School of Art on Tuesday, the 16th inst., to receive the report of the Provisional Committee appointed at the preliminary meeting in May last. Mr. T. J. Flockton presided, and there were also present Messrs. C. Hadfield, J. B. Mitchell-Withers, F. Fowler, C. J. Innocent, G. W. Wilson, R. Davidson (borough surveyor), W. C. Fenton, and W. F. Hemsoll, and a large number of the members of the profession, the meeting being of a thoroughly representative character. The rules, which have been modelled on those of the Manchester and other societies, were carefully discussed, and finally adopted; and it was decided that the society should be styled the Sheffield Society of Architects and Surveyors, and that a special meeting should be called in a fortnight's time for the election of officers, &c.

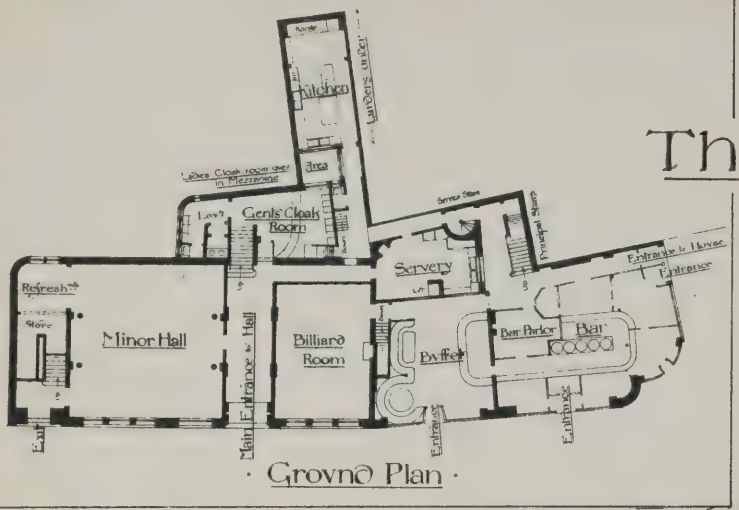
The Leeds Master Builders' Association.—The annual excursion of this association took place on Friday. The members mustered at the New Station, and left by an early train for Masham, whence the party drove to Masham village to inspect its ancient church, and thence to Hackfall. Here the visitors were conducted to the numerous places of interest in the beautiful valley, after which they proceeded to Studley Royal, arriving at Ripon about five o'clock. Dinner was served at the Unicorn Hotel. The annual meeting was subsequently held, and officers for the ensuing year elected.

CHIPS.

A new vicarage, Elizabethan in style, is being built at Edstaston, Salop, from designs by Mr. T. M. Lockwood, of Chester. The builders are Messrs. Charles Tommy and Son, of Wem.

The work in connection with the drainage of the parish of Cheshunt was commenced on Friday. The sewage is to be disposed of by means of irrigation. The farm will be situated between the Royal Small Arms Factory at Enfield Lock and Waltham-cross. The effluent water is to be conveyed in a drain through the parish of Enfield for a distance of about three miles, where it will enter the catchwater ditch of the East London Water Company. The cost of the works is estimated at about £39,000.

The Sunday-school teachers have presented a rose window, from the studio of Mr. Taylor, of Berners-street, to Christ Church, Bexley Heath. The window, which is in the south transept, was unveiled on Wednesday, the 10th inst., as a jubilee offering.



A patent has been sealed and granted to Harry Leith Mackenzie, Victoria-place, Stirling, for an improved sketching protractor for military or other purposes.

Messrs. Denne and Co., of Walmer, are just completing the construction of quarters on the Admiralty Pier at Dover for the accommodation of a battery of Artillery, who will be stationed there for duty in connection with the turret.

Notwithstanding the rain which prevailed over North Wales at the beginning of the week about 4,000 quarrymen are still idle, many of the large slate mines in Carnarvonshire, Merionethshire, and Cardiganshire having been compelled to suspend operations for want of water.

WAYSIDE NOTES.

OW is it that Baedeker does not publish a guide-book to Normandy and Brittany? would think that if there were any country likely than another to be largely visited nglishmen it would be this northern dis- of France. But even the ubiquitous Cook not supply me with any more satisfactory e than an unwieldy volume in a brilliant cover that rivals the stained glass of this to be found in the Cathedral of Rouen. leker I know by experience is trustworthy convenient, so I was sorry to find he has produced any book dealing with the country nestion. I have, therefore, been compelled ander about the old towns with the afore- bulky article just peeping out of my coat- et, thereby branding me as an undoubted ist. For I do not write in my customary nts, but in a comfortable hotel in the resting city of Rouen. It is a fête day, in consequence, the air seems positively y with the clanging of bells of all sorts sizes. One has this morning been tolled h, judging by the depth of its sonorous , must be of prodigious weight. I believe a monster at St. Ouen, which is only rung times a year. It is more like the boom of non than the sound of a bell.

---

uen makes a very pleasant start for a short in Normandy and Brittany. Anyone ing this place for the first time will be a disappointed with the old Domestic work . As a matter of fact, it is fast disappear- and making way for the Renaissance ces of the modern French architect. It is there are some individual examples that very curious, and the typical construction ie half-timbered work is quaint—solid wood tering hung with small slates, and the ling in " of some sort of concrete substance tered over to bring the exterior surface to ooth face. These buildings look very scaly ffect, and there is a wonderful sameness it this work. So it is fortunate that there nany magnificent specimens of ecclesiasti- rchitecture culminating in grandeur with glorious church of St. Ouen. The earlier ions of this building—the choir and tran- s—are grand specimens of the style. The position of this part of the building is so llent that were the church robbed of all its rative ornament—its carvings, mouldings, gargoyles—it could not but be still nsely interesting. And the skyline of this of the edifice is very fine by reason of the tiplicity of pinnacles and flying buttresses.

---

ne west portal of the cathedral is literally es thick in what looks like pure dirt and , and it would be well for the inhabitants to turn on the hose of a fire-engine, and h the whole of the carvings after the ner of the suggestion made in an evening er recently to cleanse the Marble Arch! It possible, however, that a good stream of er directed against this world-famed portal ld wash away all the carved work in a few rs, so fragile does the stonework appear. cannot but feel a sense of regret that such agnificent piece of design and workman- as this west portal to Rouen Cathedral ld have been applied to the exterior of a ding. It is totally unsuited to withstand weather. This, however, may be said of most he more elaborate Flamboyant work. It is common-sense exterior architecture, and is ainly wholly unfit for execution in the soft ie that so many of the buildings hereabouts constructed of. In the present instance, heads of statues have disappeared in a lesale manner, and much of the exquisite ing is quite obliterated.

---

here appears to be a fair amount of build- going on in the town. They were hard at k in several places on Sunday. I cannot much for the talent displayed. The average lern street architecture is very poor, and s any definite character, being generally e and flat. A new bridge over the Seine is ourse of construction, and will apparently handsome structure when complete. It is in a few yards of the timber bridge at the of the Rue Grand Pont. A total absence rry-building may be noted in these parts. work is well and solidly built, and Mr. Buggins would have to reform his ways if he came here.

I would recommend anyone coming this way not to run through Dieppe without having a day or so in that town. The church of St. Jacques is a most interesting edifice, and contains much that is worth the attention of the sketcher. The château—a castle, or fort on she hill—is a most picturesque pile of buildings, and would make many beautiful water-colour sketches. The machicolations are very fine on this castle, and the whole mass has a grand skyline. It is well, however, to resist the desire to commit to the surface of Whatman's "rough," the lovely tints of the weather-beaten fortresses of this country, unless one especially wishes to see the interior of a French prison, after the manner of Captain Bewicke. Whilst I was on the hill a man, on the point of photographing the place, was quickly sent to the right-about.

Dieppe is just now full of fashionable people. The races come off shortly, and in consequence hotel charges are very high. There is a very good Casino with a fine situation on the beach; but the building does not come up to the one at Scheveningen, which, by the bye, was burnt down a year or so ago, though, I presume about rebuilt by this time. It is a little curious that no buildings of this sort are to be found at English seaside places. In course of time we may expect to see a few Casinos on our coasts, as they could be adopted without their objectionable features as existing on the Continent.

There is a tower to the Church of St. Jaques at Dieppe that is most interesting to ascend, as from many points one is able to examine the old stonework and carvings. The weather seems to have treated the stone in this church in a most remarkable manner, wearing it into little holes varying in size considerably and resembling in their disposition the little sinkings in the more weather-worn carvings—the minute points of shadow that give so much piquancy to the Flamboyant carving as they do in our Perpendicular work. To me this seems very curious, as showing how beautifully the old carvers disposed their light and shade, that it is as artless as Nature herself. And from this tower, also, one can examine the many curious gargoyles. Of all features of these delicate Late French churches, the gargoyle seems to suffer first. Their heads drop off, or they fall away altogether, because their projection is so great. True specimens of the "noble grotesque" are these gargoyles; monstrously ugly, certainly, but generally executed with a marvellous degree of spirit.

It is my intention to move on to the north-western districts of Normandy and Brittany. I do not, however, expect to find a more magnificent perspective than that of the interior of St. Ouen at Rouen. As I saw it from the west end of the nave, during the celebration of High Mass, the effect was beautiful indeed. It is not, however, my intention to enter into the poetic about the church. We had enough of "reverberating aisles" and "dim arches" in the daily papers during the Jubilee week. But I will say that, by accident or intention, the effect of the light of the stained-glass window as seen through the arcades at the end of the apse at St. Ouen, resembles the cool tints of sunrise, and that the many crosses and screens that surround the high altar look black against the light like broken masses of storm-cloud, whilst the flicker of the long candles appear as the twinkling of many morning stars in the greyness of the dawn.

GOTH.

The current number of *Time* contains a short but not uninstructive paper on the "Reform of the Architectural Profession," by Mr. J. Neville Porter.

The Roman coffin which was found in Plumstead Marshes some months since, and was afterwards reburied 8ft. deep in the parish churchyard, by order of the vicar, has just been disinterred through the exertions of Mr. George Payne, of Tunbridge Wells, and is now on view in the drawing-room of the Brenchley Museum at Maidstone.

The Featherstone Local Board have appointed Mr. Malcolm Paterson, M.Inst.C.E., to report on the best means of supplying the district with water.

Building Intelligence.

CROOK.—The new church of St. Catherine, at Crook, near Bowness, which faces the old and disused one on the opposite side of the road, was consecrated on Thursday, the 11th inst. The new church consists of nave, 40ft. by 25ft.; chancel, 21ft. by 19ft.; baptistery, 10ft. by 10ft.; vestry, 11ft. by 10ft.; and an entrance porch. The accommodation is for 165 (exclusive of extra space for chairs). Over the baptistery there is a tower 50ft. in height, containing belfry and ringers' chamber. Yellow freestone dressings have been used both externally and internally, forming a pleasing contrast with the local walling stones. The church is entirely founded upon solid rock. The whole of the roofs are of pitch-pine, open-timbered, those of nave and chancel having arched principals rising off stone corbels. All are boarded and covered with Stevenson and Co.'s green slates from Coniston, finished with red ridges and stone crosses. The nave seats and screen work are of pitch-pine and those in chancel of oak. The chancel is laid with Minton's encaustic tiles, and the heating is by Constantine, of Manchester. The contractors are—for the masons and slaters' work, Mr. R. Pennington; carpenter and joiners' work, Mr. W. Hutchinson; plumbers' work, Mr. L. Airey; painting and glazing, Mr. J. Hine; plastering, Mr. B. Davis; carving, Mr. Simpson; art metal work and iron railing, Mr. W. Wilson. The church is built in the Late Fifteenth-century style, and has, with the fittings throughout, been designed by Mr. Stephen Shaw, of Kendal, and carried out under his superintendence.

LEEDS.—As a memorial to the Rev. C. E. Lamb, who has accepted a living in the South, the congregation of St. George's, Leeds, have decided to enlarge their schools, and to effect this two houses are being pulled down. In the basement will be a room 32ft. by 13ft. On the ground floor will be provided a boys' class-room 32ft. by 32ft., and having two open fire-places; on the first floor, approached by a stone staircase, there will be a committee or parochial room, 32ft. square. The ceiling will have a deep cove, with moulded plaster cornices, and the roof principals will be dressed and moulded. The elevation to Clarendon-road will be of Horsforth sandstone. The windows are to be mullioned and transomed, and with three lights and two lights alternately. The roof will be covered with grey slates from Idle Moor. Messrs. Smith and Tweedale, South-parade, Leeds, are the architects.

CHIPS.

A group of sculpture called "The Virgins," which was bequeathed to the Liverpool Corporation by the late Mr. Daniel Busby, has been accepted by them for the permanent gallery, and has just been placed in position in one of the rooms of the Walker Gallery. The group, which is life-sized, represents two draped female figures, illustrating the parable of The Wise and the Foolish Virgins, and is from the chisel of R. Rinaldi, of Rome.

Mr. John Blackburn has been appointed inspector of nuisances for the Ramsgate urban sanitary district, at £150 per annum.

The foundation stone of a new Sunday school of St. Luke's Mission Church, Selborne-street, Walsall, was laid on Monday. The plans have been prepared by Mr. James Davis, The Bridge, and are of a plain building to accommodate about 400 scholars, at a cost of £600.

The members of the water committee of Newcastle-on-Tyne visited, on Monday, the new reservoir now in course of construction at Hallington. The reservoir is being built from plans by Mr. W. G. Laws, the city engineer, and will cost about £100,000; it is expected to be finished within the next twelve months.

The draft charter of the proposed Teaching University for London, for which University College and King's College have petitioned the Crown, has now been presented at the Privy Council Office. It is probable that the new University, if founded, will be called the "Albert University of London."

Sir Henry Tichborne, Bart., has appointed Messrs. Thurgood and Martin, of Chancery-lane, surveyors to his Doughty Estates, situate in the neighbourhood of Bedford-row, Great James-street, John-street, Doughty-street, and King's-road.

Engineering Notes.

Connah's Quay.—Mr. Gladstone laid on Tuesday the first cylinder of the new railway bridge over the River Dee, between Chester and Flint, which, when completed, will form a new connection between England and Wales. The only railway bridge between North Wales and Cheshire at this moment is that spanning the Dee near Chester, on the Chester and Holyhead Railway. The Manchester, Sheffield, and Lincolnshire Railway Company have obtained the sanction of Parliament to extend the Cheshire Lines from Chester to Connah's Quay by means of a low-level opening bridge across the Dee. The width of the river where the bridge crosses is about 480ft., and the large swing opening will give a free passage to vessels of 140ft. in width, the "tail" span being about 80ft. The bridge is of cantilever design, and will carry a double line of rails. The length of the swinging girder will be 287ft., and the depth of the centre 32ft. The two fixed spans of 120ft. each complete the structure of the bridge. By adopting hydraulic power under a pressure of 700lb. to the inch, the bridge will be opened or closed in 40 seconds. The bridge, when completed, will exceed the span of every other bridge over a navigable river in the United Kingdom by 36ft. Messrs. Cochran and Son, of London, have taken the contract at about £80,000. The engineer for the bridge is Mr. Francis Fox, Westminster.

ARCHÆOLOGICAL.

Cowick Barton.—During the past week the site of the old Benedictine Priory Chapel of St. Andrew at Cowick Barton, St. Thomas, near Exeter, has been brought to light. The priory, which was founded by the Courtenay family, was only in existence from 1263 till 1352, when, according to Dr. Oliver, Henry VI. assigned its revenues to Eton, and at the suppression of Monasteries the lands went, with those of Tavistock, to John, Lord Russell. The excavations are being carried out under the superintendence of Mr. G. H. Fellowes Prynne, architect, of London and Plymouth. A coffin, of 13th-century character and of Portland stone, having a large cross carved on the raised lid, has been found on the site.

CHIPS.

Mr. Willis Wigg, of Lynn, has been elected assistant surveyor to the York City Council, with a salary of £180 a year. Mr. Wigg was pupil and afterwards assistant to Mr. W. G. Mawbey, then borough surveyor of Lynn, and now city surveyor of York.

A new cemetery was consecrated at Great Harwood, Lancs., on the 11th inst. The ground has been laid out, and the three chapels, lodge, and boundary wall erected, from designs by Mr. Angelo W. R. Simpson, of Richmond-chambers, Blackburn, which were selected in competition. The chief contracts, those for masonry, bricklayer's and slater's work, were carried out by Messrs. E. Lewis and Son, of Great Harwood. The total cost, including purchase of land, has been £5,200.

A new church, to be dedicated to St. Alban-the-Martyr, is about to be built at Acton-green, W. Mr. E. Monson, jun., of Acton, is the architect.

Under the provisions of the will of the late Mr. W. Ward, the City Corporation have decided to build a high school for girls on a site in South Crescent, Tottenham Court-road, having a frontage of about 100ft., and an area of about 17,000ft. superficial, now let on lease by the Corporation, for terms expiring in 1902.

Princess Louise visited Winchester on Wednesday, and unveiled a bronze statue of the Queen, which has been erected in front of Castle-hill. The statue is the gift of the High Sheriff, Mr. Whitaker, and has been designed by Mr. A. Gilbert, A.R.A.

It is proposed to build a bridge at Caputh Ferry, near Murthley, N.B. Messrs. W. Arroll and Co, of Glasgow, are the engineers; and the estimated cost is £4,500.

Plans by Mr. Sydney Mitchell, of Edinburgh, have been adopted by the heritors of Bothkennar parish, for the enlargement of the parish church, which was erected in 1789. The works, which will practically amount to rebuilding, will cost about £1,500.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

Received.—B. S. and R.—R. P. C. Co.—A. and Co.—M. H. B. and Co.—R. H.

Art Student. (There is a Slade Professorship of Fine Art at Oxford.)—Jubilee Juggins. (We have tried the more ambitious subjects before, and competitors either fail or steal bodily from well-known works.)

Correspondence.

THE STONE FAMILY — ST. MARY'S CHURCH, HOLME-NEXT-SEA.

To the Editor of the Building News.

Sir,—As architect for the restoration of the above church, I am desirous of ascertaining through the medium of your paper if any of the posterity of the Stone family are living in England? It may interest them to know that in excavating a few days ago for the foundations of the new seating, a large flagstone, 6in. in thickness, was found at the S.E. corner of the nave, with the following inscription roughly carved thereon :—"Richard Stone and Clemens his Wife." In the chancel is a richly-carved monument of alabaster and marble, with husband, wife, and 13 children kneeling, with the following quaint inscription on a tablet beneath :—

"Here under lyeth Richard Stone and Clemens his Wife who lived in Wedlocke joyersly together for 64 years and three months; of them proceeded 7 sonnes and 6 daughteres, and from those and theirs raised 72 children, whiche gave to the sayd Richard Stone and Clemens great comforte."

Richard Stone died 5th of October, 1607, aged 87 years; and Clemens died 10th day of Novr. (*), aged (*) years.—I am, &c.,

Willm. Adams, Architect.

King's Lynn, Aug. 15.

(*) Dates gone.

FIREPROOF CONSTRUCTION.

Sir,—As I have urged the necessity and practicability of this principle ever since the burning of the previous Covent Garden Theatre, and Whiteley's Emporium being set forth as fireproof, it is damaging to the system to find it fail so much in its object: First, in loss of four lives; the very narrow escape of thirty innocent horses that would in a few seconds, it seems, have suffered the dreadful fate of the sixteen hundred in New York, lately burned to death.

I have been to view the ruins and their mode of construction, as it was difficult for me to conceive such an enormous destruction of property with the precautions we read of being taken to avoid disaster by fire, &c. I have hesitated whether I should express my opinion in print, so I will just briefly recite what I consider deficiencies, or mistakes, and submit it, if you think desirable to publish it. I was in hope others would have written more on this important subject, and so delayed till now I find not so much information or comment as I expected.

First, in case the alarm of fire is made during business hours, the means of escape being of first importance, I was surprised to find the staircases of wood, chiefly oak. What a mistake!

I saw on the brick walls of the ground and first floor charred remains of wood battens and boarding. The iron girders, great and small, were not sufficiently protected from the great heat, as these and the concrete forming the floors and ceilings are battened and covered with simple thin canvas plaster, as can be seen. As the exposed iron bent, it failed to support the weight of concrete, thus the smaller girders forming the chief floors and roof came down wholesale. This can be easily prevented in construction. There need be no wood; even some of the large iron girders that remain are much bent.

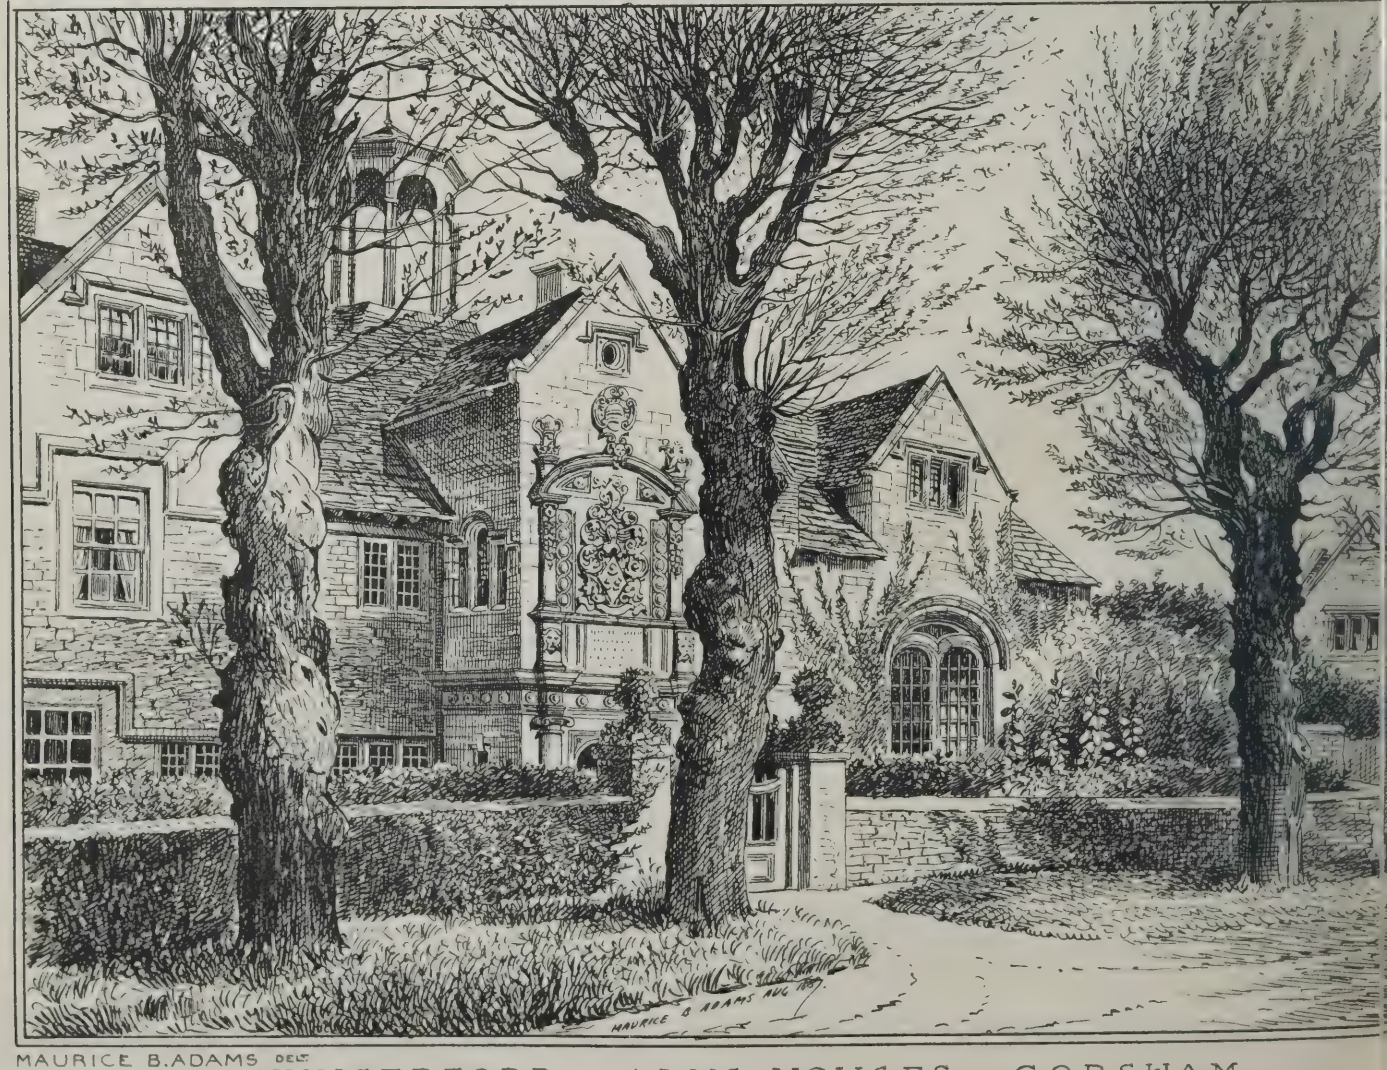
In the window openings above the shops there are very large window frames and boxings with sashes, all of wood, and which could well be of wrought or cast iron with but little or no wood.

The shop or ground floor windows burned out show the remains of wood linings round them, so do those in the shops not burned have wood linings, and great iron girders supporting the front walls above shows the casing forming the entablature; this, with the large moulding upon it, is all formed of wood quartering boarded and with lead or zinc covering. I have written and urged before that arched construction of brick instead of girders would be much better over large shop windows, having little or no wood and with all needful glass space. These arches in brick and cement can be constructed to stand fire; all linings, dado, &c., could and should be of good cements or tiles.

The revolving shutters I have read of being of steel I find are of wood metal hinged; to make sure I picked up portions to examine that laid in the street.

Some of the window openings were partly blocked with fallen charred woodwork; in two or three were pieces of flooring, the joists having floor boards attached just as they fell, apparently from first floor girders; this is inconsistent with fireproof construction, as it appears as if part of the flooring was of wood over shop windows. The surface of concrete floors are battened and boarded, but need not be, adding food for the conflagration, while a smooth surface made to the concrete, and covered with corticine or carpet, seems quite sufficient.

In some compartments the mode of construction is exposed, and the fittings, with many shelves, racks, &c., could well be of metal or slate, according to the varied requirements.



With all the precautions taken, and though the deficiencies existed that I allude to, it is surprising to see such destruction; it really looks like incendiarism, for the flames to have issued from several windows at once, and so it becomes a question whether the separating doors were shut or left open; these, I think, should and could be made to shut automatically, or from the exterior.

The stables I am sorry I did not see; but I just repeat, they can and should, in the name of humanity, be constructed absolutely fireproof, to cause no risk of our good servant, the horse, being burned alive, an event too dreadful to risk or contemplate.

The long and high brick wall forming one side seems, as I saw it at the safe distance, to be little injured beyond being forced out of upright, and crooked, by expansion of girders, &c., showing that brick again proves superior to

bursting stone under fire and water in such ildings.

[did not see into the basement; but suppose ground floor above having good abutments uld be arched, and therefore capable of taining the great weight of fallen brick, ne, and concrete of doors and roof from ve, as I read they have; indeed, means should taken to arch all that can be of concrete rs and roofs a little, introducing ties out of ch of fire and air, where it can be done at sonable cost, if no abutment available.

When all needful means are adopted, it may fairly expected that little damage would rue to a substantial structure, if only the tents are burned.

[think it is a shame so much property is rificed through the want of precautions by ners.—I am, &c.,

Broxbourne, Aug. 16th. JAS. PULHAM.

SIR,—After reading the letter of Mr. Fredk. gers in your issue of the 12th inst. with re-ence to fire in buildings, I think he cannot aware of the existence of "silicate cotton" "slag wool," which is now employed as a ans of fireproofing buildings. Of course it a well-known fact that "all sublunary sub-nces" will burn when subjected to extreme at; but some substances are much more rapid sorbents of heat than others; and if a com-ratively speaking incombustible material, nich is a good non-absorbent and non-con-ctor of heat, can be used so as to act as a p-gap in event of a fire, a step in the right rection is assuredly taken. Again, if this sub-nce will *absorb the water* which is pumped o a burning building, instead of allowing it run uselessly into the street, another advan-ge is certainly gained.

Mr. Rogers suggests the use of steam, which rough its own force could be ejected great tances; but I would submit that great diffi-lty would be found, even at close quarters, forcing jets of steam through apertures ere volumes of smoke and flame were coming t. If, however, the greater part of the ter pumped into the building be properly lised and converted into steam, it will essarily prove most effectual in extinguish-g the flames.

As an illustration of the effect of steam upon laming mass, I need only cite the familiar thod of putting out a fire in a chimney by plying saturated cloths to the fire under-ath, thus generating steam which rises and ickly extinguishes the fire above. If silicate ton be employed as a lining for walls, floors, d ceilings, it will not only add very effec-tally as a stop-gap in the event of a fire, but, ould the building be played upon by jets of ter, it will absorb nearly its own volume of ter, and retain it in suspension till the heat the fire turns it into steam.

Trusting that this information may be of ne interest and service to your readers,—m, &c., F. M. H. J.

"SURVEYS OF GREAT BRITAIN."

SIR,—You would be doing a great service to number of your readers employed upon the ve if you could give any information con-ning the intention of the Government wards them, as you are doubtless aware an ire survey of the United Kingdom will, in course of a month or so, be completed (on rge or smaller scale); and unless the authori-s intend to produce upon larger scales, and se large areas of country, a great number of n who have been trained upon this du y ce they left school will be thrown upon the ntry, with very little prospect of being able obtain a living, as the peculiar nature of ies connected with the survey in no way fits to compete with men trained in private ces, especially during the present crush in labour market. We hear rumours that re-on of Yorkshire, Lancashire, the Mid-lian, and even of Ireland are in contem-tion; but nothing definite can we gather. through your columns, you could give any rmation as to districts to be revised, or the nber of men (out of 3,000 and odd employed) t are likely to be discharged, *including* surers, you would be conferring a favour n hundreds of anxious men, who are now living in that unhappy state of mind ever attending upon suspense.

Trusting I am not troubling you too much,—I am, &c.,

Aug. 10. A PLOTTER.

THE NUISANCE FROM SEWER VENTILATORS.

SIR,—On p. 52, of July 8th issue, Mr. R. H. Reeves made the assertion that stack-pipes were utterly useless as a means of ventilating sewers. He based this assertion upon a story about his testing one of these pipes lately, when the air was "almost stagnant," as if the pipe were choked owing to the air underground being heavy. I considered and stated that his conclusion was too hasty and sweeping, because the stack-pipe was not properly put up, and also probably more than three-fourths choked. And on p. 230 of August 5th issue, I said that if his test as to the pipe being clear were the smoke-test, he might easily be deceived. In his letter in reply to me to-day, p. 269, he does not deny this; so, if silence gives consent, I am fully warranted in condemning his hasty and mistaken assertion that stack-pipes are "utterly useless as ventilators for the sewers."

As to the explanation Mr. Reeves gives of his "Fig. 2" in middle column, p. 193, it appears to me to be all nonsense as he there gives it. He does not mention any proper reason why the mere fact of the top of the vertical pipe being 50ft. higher than the inlet should give one-twentieth of an inch barometrical pressure on ground inlet, and so be able to cause a current of ten miles an hour, or 880ft. a minute. His "barometrical pressure" or motive power is also fanciful in this case, for as in the hydrostatic paradox, the water in the thin limb of the U-vessel balances that in the wider limb, so with the aërostatic law, the air inside of the pipe 50ft. high, if of same temperature, balances the whole air outside of it to same height, so that "barometrical pressure" here is nowhere!

Mr. Reeves's question on page 269 as to what additional pressure could be got by adding 10ft. to the height of the stalk-pipe he spoke of, to get it above the chimney, is simply an attempt to trap me; but I land him in it by saying that this extra 10ft. of height was not to get the extra "barometrical pressure" he writes so curiously about, but to enable the wind to get at the top of the pipe, so as to exert an expiratory or sucking-out-of-the-air effect upon it, and so cause an upward current in the pipe. This action of the wind lessens the atmospheric pressure on the mouth of the outlet-pipe, and so, the pressure being greater at the inlet, air rushes or flows towards the outlet. As a proof of this, take a small tube several inches long and dip its lower end half-an-inch or so in water; then, by blowing properly across the top of the tube, the water will rise up in it and be ejected out of it. The scent spray is an example of this force, and water is 800 times heavier than air.

The foregoing is one answer to Mr. Reeves's question on page 269, "What is the motive power that causes air to flow up shafts when the inlets and outlets are at different levels?" I will state another. Yesterday I was testing the drains of Mr. Fraser's house, 2, Crown-gardens here, and at the back of the house, which has a southern exposure, there is a metal rain-pipe put up outside, which discharges above ground. There was very little wind, and what there was, I think, would as likely have tended to cause down-draught as up-current; yet when I put my anemometer into mouth of the pipe at the bottom, 200ft. of up-current per minute was indicated. This, I think, was caused by the sun's rays heating up the pipe, and so making the 50ft. of air inside the pipe lighter than 50ft. vertically of the atmosphere outside of it. The lesson from this is, that ventilating blow-off pipes for sewers would act much more efficiently often on the sunny than on the shady side of street; and a 4in. pipe, although useful off a sewer to relieve air-pressure in it, is open to improvement as to size if good ventilation is desired.

Besides testing the above rain-pipe at Mr. Fraser's house—which house had been shut up, and there was no fire on in it—I also tested the speed of the air-current going through the 6in. drain-pipe, which went underground about 35ft., and then had the vertical soil-pipe and 4in. iron ventilating above it—together about 60ft. high—connected into its higher end. The speed through the 6in. air shaft over the disconnecting trap was 80ft. a minute. When I contracted the inlet to 2¾in., the anemometer indicated 400 lineal feet of speed. The 4in. ventilating pipe of the soil-pipe had one of my fixed exhaust ventilators on its top, and I give the credit of this air-current partly to the wind acting upon the exhaust ventilator, and partly also, perhaps, to the pressure of the wind on the mouth of the inlet. This pressure of the wind on the inlets is often a great cause of air-currents through sewers where the wind comes freely into a street, and meets with obstacles to its ready passage out. The wind passing over the sewer gratings at other times sucks air out at them, especially if gratings are large.

Apart, therefore, from barometrical pressure, the wind can be an active agent in sewer ventilation, if properly taken advantage of. The barometer may be a useful instrument for telling the heights of mountains; but, so far as I can judge from Mr. Reeves's application of it, it does not seem to be of much practical use in sewer ventilation. A scientific friend takes the same view.

I think that I have sufficiently answered Mr. Reeves's questions, and justified my opposition to certain of his statements. As Mr. Reeves is an engineer, I think he would write better on this subject if he wrote more in a practical way than as a pseudo-professor of natural philosophy. It is not everyone who can be both a master in physics and an adept in the practical ventilation of sewers.

As the man who attacks other people's ideas or plans ought to be prepared to justify his own, and to bear being cross-questioned upon them, I would venture to ask Mr. Reeves, under the circumstances, if his condemnation of stack pipes for sewer ventilation on 8th ult. was merely a prefatory blast on the sanitary horn, previous to holding forth on the virtues of sewer *disinfection*, as proposed to be carried out by him, in his newly-patented, elaborate disinfecting appliances therefor?

Perhaps the stalk pipes may yet prove useful for carrying off the smell and vapours from the disinfectants.—I am, &c.,

W. P. BUCHAN.

21, Renfrew-street, Glasgow, Aug. 12.

THE PROFESSION OF A CLERK OF WORKS.

SIR,—All clerks of works who have read the able opinions by Mr. Potter, as published in your columns, and the letter from Professor T. Roger Smith in your last issue, must feel gratified that efforts are now being made to advance the position of clerks of works.

Some of the duties described by Mr. Potter are not required in some parts of the country; but in some cases demands are made on a clerk of works to do certain kinds of work which Mr. Potter, and it is to be hoped many professional gentlemen, would consider outside the ordinary duties.

Would it not be greatly to the advantage of the public, especially architects and contractors, if every clerk of works had to pass an examination before he was placed in such a responsible position?—but by no means such an examination as some of the Government departments require a clerk of works to pass. Assuming that examinations were arranged and conducted by, perhaps, three central boards composed of architects elected by architectural associations as members of the boards, and master masons, bricklayers, carpenters and joiners, plumbers, slaters, plasterers, glaziers, and smiths—all elected by the masters' associations of the various trades as members of the examination board—owing to many circumstances three head centres would be required—for England, Scotland, and Ireland.

It could not be expected that the first examination would show very high general results all over the various departments of building construction; but only a fair knowledge of the different trades, which is necessary before anyone should be allowed to act as a clerk of works. A second examination should also be compulsory at the end of four or five years' experience, going over all the former departments in detail, with painting and heating added to the former trades. A clerk of works starting with a fair knowledge of building construction, and after four years' additional experience, should be able to pass a strict

examination, and prepare detail drawings, and specify materials and workmanship, to show if he has got the necessary knowledge and abilities to superintend important buildings.

A third examination would be an advantage to all clerks of works desiring to attain the highest possible position, and master nearly all the details of building construction. A clerk of works, with eight or ten years' experience on good buildings, should be able to pass a very strict and detailed examination, going over all the subjects already described, preparing detail drawings, showing the construction of all kinds of materials, specifications, strength of materials, value of materials, and workmanship, &c. And not the least important detail of examination would be the clerk of works management under certain circumstances—i.e., the Board of Examination would assume the usual dispute with contractors, and suppose that the contractors have made numerous statements regarding the materials specified, &c. In that case, how would the clerk of works proceed? A course of examinations somewhat similar were suggested and briefly described before the Edinburgh Architectural Association in March, 1885.

At the present time the majority of clerks of works do not receive sufficient remuneration, and most unfortunately the conduct of some is such as to bring them into disrespect. Some architects treat their clerks of works in such a way as to provoke the neglect of duties; cases of this kind have often come to the knowledge, and, on some occasions, the experience, of the writer. It is fairly well known that, as soon as some architects engage a clerk of works, they cease the ordinary courtesy of letter-writing when sending any written instructions to the clerk of works; and as if a matter of little importance to some architects, although their work is well attended to, still they will harass the clerk of works with numerous requests which have not the slightest reference to the execution of good work.—I am, &c.,

A Clerk of Works.

ISLEWORTH PUBLIC HALL.

Sir,—In your issue of to-day we note two errors in connection with our tenders. 1st, *re* "Public Hall, Isleworth," tender should be "£2,423," not "£3,423." 2nd, *re* "Vicarage, Groombridge," our names appear as "Stanbridge and Supple," instead of "Stanbridge and Tupper." Your contemporary also reports "Tupple" in one case. Altogether, matters seem somewhat *mixed*.—We are, &c.,

Stanbridge and Tupper.

Star-road, Eastbourne, Aug. 12.

CHIPS.

Damage to the extent of £40,000 has been occasioned by a fire which occurred at the sawmills of Messrs. Laverick and Goddard, of Great Union-street, Hull.

Two stained-glass windows have just been placed in Blackburn parish church in memory of the late Archdeacon Edward Birch, vicar of Blackburn. The windows, which are the work of Messrs. Burlison and Grylls, of London, are of canopy design of the 14th century, with representations of Abraham and Moses in the window of the north gallery of the church, and of Elijah and David in the south gallery window.

Two new classrooms for the national schools at Tiverton, near Bath, have just been completed. The classrooms cost £500. Mr. E. W. Buckle was the architect, and Mr. J. Long, of Bath, the builder.

The Secretary of the United States Treasury has just appointed Mr. W. A. Freret, of New Orleans, to be Supervising Architect of the Treasury Department, in place of Mr. Melville E. Bell, resigned.

A two-storied vestry is about to be built on the north-west side of St. Paul's Church, Walkden, from plans by Mr. R. K. Freeman, of Bolton. The cost, with other improvements which it is proposed to carry out in the church, will be £600.

The new park at Kilburn, adjoining the Queen's Park Station on the London and North-Western Railway, which has recently been acquired from the Ecclesiastical Commissioners, is rapidly approaching completion, and will, it is stated, be opened on September 1.

By the supplemental charter just granted to the Institution of Civil Engineers the power to acquire and hold lands, &c., has been increased from £1,000 yearly value—as in the original charter of 1828—to a sum not exceeding £8,000 annual value.

Intercommunication.

QUESTIONS.

[9367.]—**Wood Flooring.**—Can any of your readers say if the wood flooring being recently laid in the passages of churches has any advantages beyond deadening sound? Will it last as long as tiles?—Vicar.

[9368.]—**Joseph Deare, Sculptor.**—I am writing for the "Dictionary of National Biography," a notice of Joseph Deare, sculptor, who is said to have been a nephew of John Deare, the sculptor, of Liverpool. I should be much obliged if any of your readers could furnish any facts about Joseph Deare other than those contained in the records and catalogues of the Royal Academy. His death is said to have been the result of a fall from a ladder in his studio in Liverpool, and to have occurred in 1836. I am anxious to learn if this is correct, and also when and where he was born.—Albert Nicholson, the Old Manor House, Sale.

[9369.]—**Sashes.**—I should like to know if some means of raising and lowering sashes other than by weights and pulleys and cords, is in use, and whether the cost has anything to do with the retention of the old method.—Enquirer.

[9370.]—**Unrestored Churches.**—Can any one of the readers of the Building News inform me of any 13th-century parish church which has preserved its plan unaltered throughout, that is to say, in the main structure, and kindly give the dimensions?—Ecclesias.

[9371.]—**Gas-Lighting.**—Which lamp is generally admitted to give the best light, at the same time carrying off the products of combustion? I cannot leave any plants in my room long before they show signs of declining health and begin to wither up.—G.

[9372.]—**Chequered Floor Plates.**—Would some reader kindly show me how to prove the formula $t = \sqrt{\frac{\cdot 000044 \ W \ l}{b}}$ on p. 18, Part II. of Mr. Henry Adams's "Wrought and Cast-Iron Structures," for it appears to me to be wrong?—S. H. G.

[9373.]—**Brown Paint.**—Is it possible to make a chocolate-coloured paint with a white-lead base?—S. H. G.

[9374.]—**Building Construction. Honours Examination.**—Having passed first class advanced stage, I wish to sit for the honours stage next year of the examination held by the Science and Art Department. Will any reader kindly give me a list of books which I should study containing information of the nature required by the examination? Perhaps some experienced reader who has passed will help me in my early career.—A Provincial Pupil.

REPLIES.

[9310.]—**Half-Timbered Walls.**—I am decidedly of the opinion of "Jack Mortise" that half-timbered work should not be reduced to a mere sham, but that the timbers should be of good scantling, and well framed, so that the structure would stand without the filling-in. The timbers or uprights ought to be at least 6in. by 6in., the angle timbers an inch or two wider and deeper, and the filling-in of brickwork would be half-brick thick, built flush with the inside of timbers with the face set back. An inside wall of another half-brick having a cavity between the two thicknesses being well tied together with iron cramps, would render the interior perfectly dry. The panels can be afterwards rough-cast or pebble-dashed. The veneering or modern "half-timber" craze should be discountenanced by all architects as a species of "sham" of the make-believe sort. Far better, tile-hang or stucco the exterior, throwing the work into panels; but do not let them imitate timber.—G. H. G.

[9347.]—**Legal.**—Common-sense should supply the legal reply to this question. Where it was specified that "the contractor is to give all notices and pay all fees," it is not intended that he shall be at liberty to omit any portion of this duty to suit his convenience. "All" does not mean some only. If the contract has been carried out in accordance with the drawings and specifications, it is competent for the architect to certify as to completion, irrespective of the local authority. It is the duty of the local authority to see that the work does not transgress its by-laws, which the architect should make himself acquainted with before commencing the drawings and specification.—A. G. T.

[9348.]—**Boundary Line.**—There is no absolute rule to be relied on to determine the ownership of hedges and ditches. The best guide is to find out which of the owners of contiguous properties pays for keeping the hedges and ditches in repair, as the expense would naturally fall upon the owner. In the case of a field next to a public road, the ditch may belong to the road authorities if it forms the only means of draining the road; but the ditch and right of drainage may belong to either party. The hedge, however, will probably belong to the owner of the field, as it is not essential to the road.—A. G. T.

[9348.]—**Boundary Line.**—"Young Surveyor" will find his question exhaustively treated in back volumes of the "B.N." The ditch which belongs to the fence is generally on the reverse side of the fence. The edge of the ditch is the boundary in this case. The centre of hedge where there is no ditch is presumably the boundary.—G. H. G.

[9349.]—**Concrete Floors.**—This question cannot be easily answered. So much depends upon the quality and proportions of the materials employed and the care used in mixing them. "Kew" had better be sure that he thoroughly understands what constitutes good concrete, and how to make it, and then construct some experimental slabs as nearly resembling the required floor as possible, and test them. Some information as to strength of floors may be found in the *Journal* of the Society of Arts of 3rd July, 1874, and in Potter's "Concrete: its Use in Building"; also as to Cantilevers, &c., in the Building News. Vol. XXX. p. 383. Properly conducted experiments with various mixtures are much required, and would prove of immense value to engineers and architects.—A. G. T.

[9353.]—**Land Surveying.**—"Juvenis" can charge by time. If the buildings and contents of separate fields were required, the charge may be put at a higher rate. I should think the labour may be worth at least £3 to £5 for a field of 3½ acres, according to the scale and detail, but it is impossible to give a correct idea without knowing the trouble and labour. As a rule, surveys of estates, when the contents of each field and the boundaries are shown are charged for from £7 10s. to £10 for the first 100 acres, and one shilling for every additional acre.—G. H. G.

[9355]—**Vanishing Point.**—Answering "S. E. C.,' there is no necessity to draw every line to the vanishing point. When it is once found, it is easy to mark off a scale of proportionate distances at the edge of drawing-paper, marking thereon all the chief intermediate points. The centrolinead will enable the draughtsman to dispense with such labour; generally the artist relies upon his own eye for the intermediate lines.—G. H. G.

[9356.]—**Composition and Design.**—"One Anxious to Know" should carefully read Garbett's "Principles of Design in Architecture." He would do well also to read Alison's "Essays on Taste," especially the chapters on the Beauty and Sublimity of the Material World and those on Architectural Proportion. By reading these works studiously the student will gain all he need to know at present—at least on a subject that can only be learned thoroughly from the study of good architecture, and by experience and thought combined.—G. H. G.

[9358]—**Bottom Flange.**—This is an indefinite question. Formulæ for calculating the strength of such joists as are shown in "A.'s" sketches may be found in Molesworth's "Pocket-book," Humber's "Handy Book on Strains," &c. Two excellent articles on the subject are also to be found in the B. News, Vol XL. pp. 284 and 413 (March 18 and April 15, 1881), which "A." would do well to study. If "A." will furnish the necessary details of any particular case, I shall be pleased to help him to a solution of the question.—A. G. T.

[9366.]—**Cement on Tiles.**—P. cement may be removed from the face of encaustic tiles by means of muriatic acid, commonly known as "spirit of salt" diluted. It would be as well to remove the acid also after the cement is disposed of.—A. G. T.

CHIPS.

The Dudley-road Board schools, Wolverhampton, were reopened last week after enlargement by the addition of an upper story. The accommodation has been enlarged from 578 to 908 school places at a cost of £2,507. Messrs. P. Horsman and Co., of Wolverhampton, were the contractors.

The annual report of Mr. Wilkins, Master of the Edinburgh Fire Brigade, states that the improvements effected in the brigade of late years and the increased efficiency of the corps have reduced serious fires to a minimum in that city. The annual cost of the brigade to the ratepayers since 1873 has been less than a halfpenny per pound rate.

Lord Rosebery, Sir Charles Tennant, Sir F. Leighton, Sir John Gilbert, Sir J. D. Linton, and Mr. W. Agnew have been appointed as the Fine Arts and Loan Committee for the Melbourne Exhibition of next year. All communications respecting exhibits should be addressed to the Secretary, 8, Victoria-chambers, Westminster.

A new church at Criccieth, Carnarvonshire, dedicated to St. Deniol, and built from designs by Messrs. Douglas and Fordham, of Chester, was opened on Friday.

The Wandsworth district board have obtained the sanction of the Metropolitan Board of Works to the borrowing of £12,000 for the erection of a refuse and dust destructor at Battersea.

New Roman Catholic schools to accommodate 350 scholars are being built at St. Illtyd's, Dowlais, Mon. Mr. Edmund Kirby, of Liverpool, is the architect.

On Friday the Prince of Wales received Sir Frederick Abel, the organising secretary of the Imperial Institute, and Mr. Colcutt, the architect of the building, at Marlborough House, and, having examined the revised plans of the latter, gave instructions for the work to be commenced without loss of time. The site of the building at South Kensington, and of the new road which it is proposed shall face it, and which will connect Queen's-gate with the Exhibition-road, was subsequently inspected by his Royal Highness. Sir F. Abel, Mr. Sayles, the assistant secretary of the Royal Commission for the Exhibition of 1851, Mr. Hunt, surveyor of the Royal Commission, and Mr. Colcutt were in attendance.

A public meeting was held at Peel, Isle of Man, on Thursday evening to consider a proposal by Messrs. Tayleur and Co., that the town commissioners should purchase the whole of the shore fronting at Peel Bay, with a view to demolishing old property thereon and erecting modern lodging houses. The syndicate guaranteed all the expenses of acquiring the land. The scheme was favourably received, resolutions accepting the proposal being adopted unanimously. Proceedings to carry out the scheme, which will convert Peel into a first-class watering place, will be taken forthwith.

The parish church of Chelvey, near Bristol, is about to be restored, from plans by Mr. J. H. Spencer, of Taunton.

LEGAL INTELLIGENCE.

Messrs. Doulton and the Smoke Abatement Acts.—At Lambeth Police court, on the 11th inst., a summons was heard before Mr. Saunders with regard to the alleged non-consumption of smoke upon the pottery works of Sir Henry Doulton, at Lambeth. Mr. Poland prosecuted for the Treasury. The evidence showed that dense black smoke was seen issuing from the shaft upon the defendant's works and lasted for some 15 minutes. Sir Henry Doulton said he had gone to an immense amount of expense and trouble in order to meet the requirements of the Act. He had erected a shaft, which was some 250ft. high. Witness thought there was communication from nine kilns and 55 fireplaces. Mr. Coles, the inspector under the Act, said if proper care was used in the firing the smoke might be prevented—the stoking required great care. Sir Henry Doulton said that for years he had made this matter his study and had entered into expensive experiments in order to bring about a total consumption of smoke if possible. With regard to the present case, the kiln mentioned was not so satisfactory as it might have been, and he at once had it stopped and alterations made. Mr. Saunders suggested an adjournment for a month to enable Sir Henry Doulton, who had no doubt exerted himself for years to carry out improvements, to still further see what improvements could be carried out. The case was then adjourned for a month.

Serious Charge against an Architect.—John Leslie Watson, 47, an architect, residing at Blackheath, has been charged, on remand, at Bow-street Police-court with obtaining £150 from a solicitor by false pretences.—The alleged false pretence was with regard to the encumbrances upon an estate, the fee simple of which was vested, the defendant said, in him.—The defendant was committed for trial, but allowed bail.

WATER SUPPLY AND SANITARY MATTERS.

The Sanitary State of Oxford.—A dispute has arisen between the Local Government Board and the local board for the city of Oxford, the latter authority being indisposed to adopt by-laws for the purpose of requiring a certain amount of open space to be provided in connection with every new building that is erected in the city. The Local Government Board have endeavoured to induce the local board to do this, but without success, and the state of things has become so serious that the Board have recently had a special inspection of the town made by their assistant medical officer, Dr. Thorne-Thorne, and their architect, Mr. P. Gordon Smith. The report made to the Board by these officials has just been issued, and in it they state they have been much impressed by the excessive overcrowding of buildings on area, especially in the centre of the city near the Carfax. In many instances the property of comparatively small extent and height has been replaced by lofty buildings covering an increased amount, if not all, of the limited area to the rear; movement of air behind the street frontage being thus greatly interfered with; and the properly acquiring a large increase of value which must almost indefinitely postpone the provision of needed open space to the rear of domestic buildings. Messrs. Thorne-Thorne and Smith add "even where the authority have, under their existing by-laws, powers tending to the proper construction of domestic buildings, they are not properly enforced. Thus, at New Botley, we found that a very inferior class of building has been allowed to be erected, the party walls being only 4½in. thick, and only every second party wall being carried up through the roof; and this although the present by-laws require the walls of new buildings to be of whatever thickness the sanitary authority approve, and all party walls to be carried up 12in. higher than the roof-covering."

Northallerton.—A new water supply is about to be provided for this town at an estimated cost of £12,000. Acting on the advice of one of the surveyors of the Local Government Board, the board have been carrying on boring operations in the side of the hill at Cotcliffe, four miles south-east of Northallerton. Already the boring has reached a depth of 300 yards, the spring, whose course is followed at this point forming the main source of the new supply, which is soft in quality. A second spring in Sigston Wood will also be utilised, and there are several supplementary springs which will be used to augment the supply if necessary. Between Sigston Wood and Cotcliffe an iron aqueduct, varying in diameter, will be provided, the length of the piping being about two miles. From Cotcliffe the conduit will be continued to Thornton-le-Beans, a village three miles from Northallerton, where will be constructed a reservoir containing 1-1-6 million gallons. The water will be conveyed by gravitation to Northallerton by an 8in. aqueduct. Mr. A. M. Fowler, Manchester is the engineer. The contracts for the various works have not yet been let.

PARLIAMENTARY NOTES.

Church of St. Mary-le-Strand.—In answer to Mr. Kimber, Mr. W. H. Smith said, on Monday: Full information as to the present condition of St. Mary-le-Strand was given to my hon. friend on Monday last, and he was informed that, though the Metropolitan Board of Works had considered the suggestion as to the removal of the church, they were not in a position at present to act upon the proposal. It is not the duty of Her Majesty's Government to introduce Bills relative to Metropolitan improvements, and I am unable, therefore, to give my hon. friend any hopes of the Government taking steps in the matter.

Contract for Asphalte.—In answer to Mr. Conybeare, Sir H. Holland said, on Tuesday: The Government and Legislature of Trinidad are considering an offer by the lessees of part of the pitch lake to take a lease of the whole on terms which would insure a minimum royalty of £10,000 a year. That offer and the whole question of dealing with the lake are under the consideration of the colonial Legislature, and it is expected that their opinion will be expressed about the 1st of September. It is believed that the supply of asphalte is practically inexhaustible. I am not aware that any other offer has been made for an exclusive concession, nor would any person except those who held leases of portions of the lake be able to make such an offer. The Government is not in a position to invite tenders for an exclusive concession, as part of the lake is already leased for a considerable period.

Decorations of the Houses of Parliament.—Mr. De Lisle asked the First Commissioner of Works what was the cost of the great mosaic of St. George in the central lobby; if he could state the reasons, other than financial, why the remaining arched spaces had been allowed to remain so long in their present bare and unsightly condition; and whether the Government could hold out any hope that before long exertions would be made to complete the mosaics in a manner becoming the beauty of the lobby and the dignity of Parliament. Mr. D. Plunket stated that the total cost of the great mosaic of St. George in the central lobby, including £150 for the design, was £665. In consequence of the opinion expressed by Messrs. Cope, Ward, Armitage, Poynter, and Watts, who were consulted by Mr. Ayrton in 1870, it was deemed inexpedient to proceed further with the mosaic pictures. A committee was, however, appointed on the subject of fresco paintings in the House of Commons, and their report was duly presented to the House on the 12th February, 1872. Mr. Ayrton then submitted to Parliament an estimate of £500 in the Votes of 1872-3 for completing one annual fresco. The item was, however, struck out in Committee of Supply. Nothing had since been done in the matter, nor could he hold out any hope that anything would be immediately done towards filling up the remaining arched spaces, for which there were no designs at present in existence.

CHIPS.

The will of Mr. William Jacomb, chief engineer to the London and South-Western Railway Company, late of Bardon Lodge, Wimbledon, who died suddenly at his office on May 26 last, has been proved, the personal estate amounting to upwards of £69,000.

At a meeting of the Governors of the General Infirmary for Northampton, held last week, it was reported that £38,600 had been given towards the enlargement of the building. A building committee was appointed, with instructions to proceed at once with the addition of a western wing of three floors, and to make provisions for the subsequent erection of a corresponding wing on the east side.

At the last meeting of the Lancashire and Cheshire Antiquarian Society, the Rev. W. H. Burns exhibited a perforated stone hammer 3in. by 5in., found in 1870 by a labourer for a contractor in Corporation-street, Manchester, in digging through a gravel bed at a depth of 25ft. below the surface, whilst excavating for the foundations of some new buildings near the Trevelyan Hotel. The implement is similar in shape to one figured by Dr. John Evans at p. 158 in his book on "Stone Implements." This is perhaps one of the most important "finds" of the kind in Manchester, and it is now on view in the exhibition of local stone implements in connection with the British Association meeting at the Owens College, Manchester.

The members of St. Alban's Architectural and Archæological Society made an excursion on Friday, the 5th inst., to Redbourne, Flamstead, and Beechwood, under the conduct of their honorary secretaries, Canon Davys and the Rev. H. Fowler. We regret that the late date at which we received a report of the proceedings precludes us from doing more than merely mentioning the meeting.

Our Office Table.

All lovers of art will rejoice that Knole House, Sevenoaks, escaped uninjured from the fire which destroyed an adjacent Mediæval barn and its contents on Tuesday, for, from the almost unaltered character of its fittings and decorations, Knole is one of the most interesting baronial mansions in England; and it contains, moreover, a magnificent collection of Jacobean furniture and many valuable historical portraits. The entrance-hall and ground staircase were illustrated by a double-page photo-litho. in the Building News for August 20, 1886.

We have arrived at the annual season of discomfort when one or other of our great thoroughfares becomes periodically blocked for the purpose of being repaved or repaired, and this year the epidemic of obstruction is peculiarly severe in the neighbourhood of Piccadilly Circus. In addition to the removal of the wood-paving, the opportunity is being made use of for the introduction along Piccadilly of the mains of the General Hydraulic-Power Company. This most modern development of high-pressure service is replacing an ancient line of wood pipes of a type which has now wholly disappeared. The pipes in question, which have evidently been out of use for some time, are constructed of elm, being bored out of the solid tree. The diameter of the bore is 7in., and the various lengths are put together on the spigot and faucet system, the spigot being turned down with a conical taper to an external diameter of about 9in., and inserted into the next pipe for 6 or 7in., the average thickness for the timber surrounding the bore being from 4 to 6in. These pipes, which are each about 8ft. in length, are laid at a depth of about 2ft. beneath the surface, and as a considerable length of piping is being exposed, it may interest our readers to examine these remains of the system of distribution which prevailed in London previous to the employment of cast iron for water mains.

Sir J. C. Robinson protests against the threatened destruction of the church of St. Mary-le-Strand, which is so placed as to strike a keynote of scenic picturesqueness happily re-echoed by all its surroundings. Sir John adds:—"I have always regarded this particular church as he very finest of all our metropolitan ecclesiastical structures of the Wren period and following, as characteristically English in style, and in fact a perfect and beautiful model of a church of the fully-developed Anglican Protestant era. I cannot help saying, indeed, that I think if, while taking reverent care of our ancient Gothic churches and eschewing hypothetical and needless "restoration" *in toto*, we had, in our new churches, worked on the lines of these 17th and 18th-century models, instead of practically swamping and vulgarising our old Gothic churches by an infinite number of vapid, soulless copies, art and religion alike would have been better served. . . . I trust that all artists, all architects, Gothic, Classic, and Queen Anneists alike, and every person of taste and culture, with a heart regardful of ancient things and associations, and an eye for the picturesque, will rally to the defence of St. Mary's-le-Strand, should it be seriously menaced." There is no doubt that projects for removing the church and the south side of Holywell-street, which narrow the Strand to an inconvenient extent, have been under the consideration of the Metropolitan Board of Works and the Strand Vestry many times since the opening of the Law Courts, and the question has again been brought forward by the dangerously decayed state of the external masonry of the church; but threatened buildings live long, and there seems no immediate probability of Sir J. C. Robinson's fears being realised.

If the Abbé Larrieu is to be credited, the Great Wall of China, which every schoolboy is taught stretches for 800 leagues in solid masonry and in an unbroken line along the southern frontier of the Mongolian Empire, is a huge imposture, notwithstanding the description of it given by travellers from the days of the Jesuit Martini to the present time. The

Abbé admits, indeed, that a Chinese Emperor undoubtedly did conceive the idea of a wall from the Gulf of Liao-Long, on the east, to Kansu, on the west, and this, though never realised, had a beginning; and that all along the proposed line of the wall square towers of earth, or of earth faced with brick, were constructed at considerable distances from each other; but these were, he asserts, never joined together by any wall, as was originally intended. In some of the defiles along the route there are walls; but these were intended to close these particular passages, or they are merely the walls of villages, and are not parts of a larger scheme. Hence, the only part of the scheme of the Great Wall carried out was the construction of these scattered towers. The rest, he declares, never went beyond the brain that conceived it. It was never more than a fancy, and it is now a myth.

On the other hand, Mr. W. G. Howell, of Brighton, declares from personal inspection of many portions, that the Great Wall is "as incapable of being explained away as Fleet-street or the Strand." When Mr. Howell was detained a few years since for three weeks at Kalgan (Chan Chia Kow), he and his friends frequently scaled the wall, and traced its course along the hills extending east and west as far as the eye could reach. While, therefore, it is possible that parts of the Wall have disappeared, Mr. Howell adds that "if the Abbé Larrieu states that the square towers along the proposed line of the ramparts were not connected with a Wall, and that this Wall, guarded and defended by these towers, does not run through the valleys and over the tops of these hills, he states that which is contrary to the facts." Mr. J. M. Molesworth confirms this testimony, and states that he has crossed the Great Wall at Kalgan, at Shanhaiquan, on the sea coast, and many other places, and where there are considerable breadths he has walked along from tower to tower. Others who have travelled in China have given similar evidence as to the substantial existence of the wall.

In the 30th annual report of the National Portrait Gallery just published, the trustees lament that no effort has as yet been made to provide the collection with a more accessible home than Bethnal-green Museum, to which it was removed two years since. Among recent donations and purchases are portraits of the late Viscount Cardwell, by G. Richmond, R.A.; William Wilberforce, by J. Russell; E. Hyde, Earl of Clarendon, by G. Souest; the fourth Duke of Bedford, by Gainsborough; Roger North, by Sir Peter Lely; A. Raimbach, the engraver, by Sir David Wilkie; Samuel Rogers, by T. Phillips; Amelia Opie, by I. Opie; Sir Robert Peel, by John Linnell; Viscount Melville, by Sir Thomas Lawrence; and George Washington, by the American painter, G. Stuart. A photograph of John Stuart Mill, taken before his marriage, has also been added to the collection.

By the death of Mr. William Barber Buddicom, of Penbedw Hall, Mold, Flintshire, has passed away one of the few survivors of the great railway and mechanical pioneers of fifty years ago, with whom were intimately associated, in the construction of the first series of railways in England and on the Continent, George and Robert Stephenson, Joseph Locke, John Errington, Thomas Brassey, William Mackenzie, and others who have predeceased him. Mr. Buddicom was born at Liverpool in 1816, and was apprenticed to the engineering firm of Mather, Dixon, and Co., of Liverpool. At the age of 20, he was appointed resident engineer on the Manchester and Liverpool Railway, and during the time he was so employed carried out many important works. Two years later, in 1838, he was appointed engineer on the joint Glasgow, Greenock, and Paisley Railway, where he remained till 1840, when he was appointed locomotive superintendent of the Grand Junction Railway. In 1841 he was called to France by Mr. Joseph Locke to erect works near Rouen for the purpose of constructing the rolling stock for the Paris and Rouen Railway, and he held the contract for working that railway until 1860. He was connected with Messrs. Brassey and others in making the Bellegarde tunnel on the Lyons and Geneva line, and also in constructing and working the temporary Mont Cenis Mountain Railway on Fell's system, the Southern Railways and Maremma Railways of Italy. In 1864 he retired from the business of his profession. He was a member of the Institution of Civil and Mechanical Engineers, and also of the Société des Ingenieurs Civils of France.

The necropolis of the ancient city of Carmona has just been discovered about half a mile beyond the Arab gate of Seville. Between two fields known as the Quarries and the Olive Groves the excavations have brought to light a great many sepulchral chambers, hewn out of the rock, with funeral urns in the sides. The roofs of these sepulchral chambers are some of them vaulted, while others are flat. There are several furnaces either inside or just outside the chambers, and it was in these that the incineration took place, the ashes being placed in black earthenware urns. Among the other objects found were many coins, a mirror with a handle, a lamp, a lachrymary, a bronze statue, pieces of iron, and libation cups.

Messrs. F. J. Besley and Co. have excavated, during building operations on Botolph Wharf, one of the shore piles of the first London Bridge, which is mentioned in Stowe's "Chronicles" as having been erected in the time of William the Conqueror. The pile was dug up at a depth of 20ft. below the surface. It is apparently of oak, an irregular square, about 9in. across in either direction. From the grain of the wood and the position of the centre of the rings, it seems that the pile was not square, but oblong in section. The edges that join the two faces are almost black, and show the fibre of the wood, saturated and blackened with 800 years of immersion in the Thames water and mud, and its weight is, of course, increased thereby. But even yet the stout fibres hold together, and the pile might be used as a trustworthy prop for other eight centuries, for it is in an admirable state of preservation, and right up to the heart seems as solid as if it came from the sawmill yesterday.

Trade News.

WAGES MOVEMENTS.

Edinburgh Joiners.—A largely-attended meeting of the Edinburgh joiner trade was held on Friday night in the Good Templar Hall in connection with the demand for an increase of ½d. an hour on the present remuneration—6½d. Reports were submitted from the different shops and works in the city. Considerably over forty employers have unconditionally agreed to give the increase. A few have offered the men 6¾d., but that had been refused, causing between 80 and 100 men to cease work. The reports were considered satisfactory, and a resolution was carried unanimously pledging the men to continue the agitation till it is carried to a successful issue. At an adjourned meeting held on Saturday it was reported that 55 employers had agreed to give the halfpenny advance and that only about 15 large masters still held out. Eleven of these having given in, the strike terminated on Tuesday.

The Theatre Royal at Bournemouth has been transformed into a town hall, and will be opened in its new capacity on Monday next. The building now seats in the large hall 1,600 persons, and has five entrances and exits. Messrs. Jenkins and Son, of Bournemouth, are the builders.

The ninth annual exhibition of decorative arts, under the auspices of the Union Centrale, was officially opened at Paris on Friday, in the Palais de l'Industrie, by M. Spuller, Minister of Public Instruction, Fine Arts, and Worship.

A new boot factory has just been completed at Fillwood, near Banbury, and in celebration of the event the proprietors entertained the workmen in the employ of the contractor, Mr. W. Godfrey, of Kingswood, at dinner on Saturday.

St. Leonard's parish church, Woore, was reopened after restoration, from plans by Messrs. Lewis and Son, of Newcastle, Staffs. Mr. Webb, of Silverdale, was the builder.

The members of the Monmouthshire and Caerleon Antiquarian Society held their annual meeting at Peterstone on Tuesday, when the interesting churches of Peterstone, Marshfield, and St. Bude were visited.

The new waterworks which are being constructed at Amsterdam by Messrs. John Aird and Sons are nearly completed.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 50 years.

Holloway's Ointment and Pills.—A few doses of the Pills taken in time are an effectual preventive against Gout and Rheumatism. Any one who has an attack of either should use Holloway's Ointment also, the powerful action of which, combined with the operation of the Pills, must infallibly effect a cure.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

BEST BATH STONE.

FARLEIGH DOWN, CORSHAM DOWN, BOX GROUND, COMBE DOWN, WESTWOOD GROUND. STOKE GROUND.

RANDELL, SAUNDERS, & CO., LD.
CORSHAM, WILTS.

BATH STONE.

PICTOR'S MONKS' PARK. CORSHAM DOWN. BOX GROUND. FARLEIGH DOWN. COMBE DOWN. STOKE GROUND. WINSLEY GROUND. WESTWOOD

PICTOR and SONS, BOX, WILTS.

COX, SONS, BUCKLEY, & CO., MONUMENTS, MEMORIAL BRASSES & TABLETS.
Southampton-street, Strand, London.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

C. B. N. SNEWIN,
MAHOGANY, WAINSCOT, WALNUT, & TEAK MERCHANT,
Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, Back Hill, Hatton Garden; and 29, Ray-street, Farringdon-road, E.C.

The largest stock of thoroughly seasoned hardwoods, in all thicknesses, ready for immediate use. Telegraphic Address: "SNEWIN, London."

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

Alsager.—For building a villa residence at Alsager, Cheshire, for Mr. F. C. Mayer. Messrs. R. Dain and Son, Burslem and Hanley, architects. Quantities supplied by the architects:—

Sadie, Chesterton	£2,175 0 0
Booth, Alsager	1,950 0 0
Stringer, Sandback	1,850 0 0
York, Tunstall	1,837 0 0
Gallimore, Newcastle-under-Lyne	1,816 0 0
Cope, Tunstall	1,785 0 0
Cooper and Jones, Tunstall ...	1,781 10 0
Longden, Burslem	1,767 0 0
Bennett, Burslem	1,760 0 0
Kearton, Tunstall	1,723 0 0
Cooke, Burslem (accepted) ...	1,700 0 0
Foster, Longport	1 680 0 0
Bowden, Burslem	1,670 0 0

Berkhampstead.—For construction of a boys' playground at the workhouse, for the Great Berkhampstead board of guardians:—

Matthews	£54 10 0
Osborn, D....	52 0 0
Nash (accepted)...	38 0 0

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1703.
FRIDAY, AUGUST 26, 1887.

THE MODERN ARCHITECT AND HIS REQUIREMENTS.

THE requirements of the modern architect are becoming so numerous, demanding from him attention to details of so varied and miscellaneous a nature, that it is no longer enough that he should be a designer and builder. He is frequently called upon in the same work to bring into requisition a knowledge of many different branches of physics, to be an expert chemist, geologist, and sanitary engineer, in addition to the artist. It will be said to be impossible for one man, however generally conversant, to be both a scientist and an artist — the two vocations are so essentially opposed or hostile in their nature, the faculties necessary for acquiring scientific facts are of a nature entirely different from those exercised by the artist, and that, therefore, it would be safer and better on public grounds to separate the duties and to subdivide the profession as much as possible. In no other profession are such contradictory functions and duties called into requisition. The medical practitioner has to become a proficient in a number of independent branches of science; but they are all of correlated classes, so that the faculties have not to undergo that severe mental wrench called for when attention has to be drawn from some scheme of decoration or colour to the details of plumbing; from a piece of architecture, pure and simple, to the working details of iron construction. The lawyer has to undergo no such intellectual feat as that of turning from a building contract or a complex bill of quantities to the conception of an ideal design, calling for the functions of the poet and painter. An advocate at the Bar has to do many things, to be competent to examine scientific facts, to cross-examine doctors, engineers, artists, and manufacturers; but diverse though the questions be, the mental faculty engaged is that of collecting evidence for or against a certain legal position. Scientific laws and facts are mere dice in his hands. The architect alone of all the professions has to learn and apply things which conflict with his art, to make them subserve his purpose, to harmonise them as he best can. He is compelled to accept new ideas of construction and every new appliance or material as part and parcel of his business. There seems to be no limit to this ever-increasing domain of his art. He is obliged to keep himself informed of this and that brick, this new method of warming and ventilation, some recent sanitary appliance, or some new method of flooring, and he has to bring to the consideration of these matters a knowledge of facts and scientific principles to enable him to arrive at a right judgment as to their merit and suitability. That he often fails to judge rightly cannot be wondered at, seeing how many prejudices he has to study or conquer. The engineer's accomplishments are of a more coherent kind. They do not quarrel with one another. His mathematics are on good terms with his mechanical and hydraulic requirements; he deals simply with facts and results as he finds them without respect for any ideas or sentiments. The phrase "fine art" is not to be found in his vocabulary, and opinions and tastes are relegated to the region of frenzy, quite outside the domain of engineering science. Therefore, he has nothing to reconcile. He has not to clothe his iron construction with "art faïence," or to consider the necessity of giving "apparent" strength to his mechanical structures. He knows of no proportion but that derived from natural laws and formulæ. With the engineer scientific construction is everything; with the architect it is supposed only to subserve art.

There are very few Da Vincis and Michael Angelos, men proficient in art as well as science, who can turn their minds readily from the mechanical requirements of building to architecture, painting, or sculpture. Nay more; many in the profession find it impossible to acquire more than two or three things really well. Those architects who can devise a good plan are seldom equal as artists; but a greater disparity is to be found between those who can make designs on paper and those who can carry them into effect. The consequence of which is an unfortunate separation that has irretrievably injured the profession in the public mind—viz., practitioners and artists. There are two definitions of the architect as now exercised. The first of these is an individual who can devise plans and construct buildings to meet any of the numerous requirements of modern life, who is sufficiently master to know what is necessary; the second definition is one who can design attractive and handsome buildings or monuments.

To enumerate a few of the branches of building in which architectural knowledge has to be largely supplemented by special attainments: (1) Hospital construction. Here medical science and hygiene are the chief questions. The medical principles involved in the planning and classification of hospitals have been to a large extent formulated, and plans based on experience are accessible to the architect. For all that he ought to be abreast of medical opinions. The structural arrangements are necessarily subordinate to the right understanding of health and disease or the laws necessary to the attainment of the one and the treatment of the other, for it is on the right interpretation of principles that structural types and arrangements must be based. We might trace several changes in hospital construction during the last few years if space permitted. Even the form of ward has been more or less modified. Years ago buildings of three or four stories were erected upon a plan that seemed to favour economic results; but lately hygienists and medical authorities have boldly pronounced in favour of single storied pavilions like those proposed by M. Tollet in the system bearing his name. The vital question of ventilation and warming is one of the first importance to those engaged in designs for hospitals, and no amount of precedent will atone for ignorance of the laws of the subject. Some architects run away with the idea that if so much cubic space be allowed for each bed, according to printed tables, their work in the matter is at an end; but there is more to consider than space—there is renewal of air, and the number in the ward. What is necessary to find is the coefficient of aëration, or the renewal of air necessary, for, as is evident on a little consideration, there is no uniform figure without reference to the size of room and the number of persons in it. Thus it is explained by a French authority that the larger the space, the less will be the quantity of fresh air to be introduced within a given time for each patient, in addition to any burning lamp. Pathology and chemistry have not yet determined what amount of organic impurities are prejudical to inmates of hospitals, what normal standard of purity ought to be obtained, and what temperature is required, and until these factors are decisively known the problem of establishing a general rule will be unsolved. We believe that hospitals in the future will have to be rather a collection of small than large wards. Pasteur and other pathologists have shown that the fewer the sick in a given space the better; however good the ventilation may be, large aggregations of human beings are found to generate a condition of health injurious to all exposed to it. The conditions favouring blood-poisoning in hospitals point especially to a reduction of the number in each ward. Then, again, there is the question of connecting pavilions. Recent practice in France Germany, and the United States completely separates the accessory administrative buildings, and the pavilions are isolated, whereas not long since connecting corridors were deemed essential. Other arrangements partially adopt the detached pavilion, with open covered passages or corridors confined to the ground stories. In short, the architect has to make himself a master of pathological researches into this matter; he ought to be acquainted with the results of investigations into statistics bearing on hospital gangrene and fever. (2) Schools. This is a class of buildings requiring a large amount of special information and statistical details. The elementary school has within our time developed from a very insanitary type to a building that may be pronounced almost perfect. But in this class also the question of aëration and good lighting requires the studious attention of the architect. He should not follow implicitly plans of existing buildings, however good, but should make himself master of the results of recent investigation, and papers read at annual conferences, which he can only do by reading the professional journals. There is no royal road to knowledge; it must be followed through a certain amount of hard and uninteresting reading, which we are inclined to think many architects have little taste for in these busy times. But it is the only way to obtain facts and data, which no amount of looking up illustrations of buildings can possibly do. Look at what a school architect ought to know in addition to his building knowledge of school hygiene, if he really wants to become a master of this branch of his business. Pneumatics and chemistry as they affect ventilation, physiology as far as it bears on seats and desks, a knowledge of orthopœdic surgery, which is engaged in cases of curvature of the spine and bone diseases developed by bad postures and sitting in schools; systems of ventilation and warming; light and structure of the eye and the defects of vision which are found to follow prolonged exertion of the eyes and inadequate or improper lighting. The Educational Department and the London School Board rules have to be learned of course; but these can only make a regulation plan, certainly never a masterly design. (3) The Technical School presents a problem to the modern architect. All at once he finds it necessary to know what technical education is, and the course of instruction so as to meet the requirements of school promoters. To know how a building ought to be planned and fitted up for technical classes it is necessary to learn a great many things appertaining to physics, such as the methods of measurement, the use of instruments employed in measuring and determining specific gravities, hydrometers, pendulums, &c. In the class-rooms for mechanics various apparatus and fittings are required; for example, professors engaged in teaching mechanical engineering need a very long blackboard for representing mathematical formulæ, and this board ought to be hung up so as to be very easily raised or lowered with a touch of the finger. The requirements of chemical laboratories are numerous, and the designer of these schools ought to know something of the working of laboratories, the width between the benches, the shape and position of sinks, the fitting of sulphuretted hydrogen closets, reagent racks for students engaged in quantitative and qualitative chemistry. Let us give an instance: In many chemical operations injurious vapours and gases are evolved, and have to be removed quickly, and the architect has to provide niches convenient to the student in which

the experiments can be made. Sometimes recesses are provided between the windows for the purpose, with projecting slate slabs with sinks, the gases and fumes being carried off by a flue leading from a hooded top, with special porcelain tubes conducting fumes away from any apparatus. A fresh-air inlet to each niche is necessary, and a sliding sash to close the receptacle from the room. In some laboratories concrete foundations are necessary for the tubes, to minimise vibration in carrying on delicate operations; in short, every science is treated, so that the practitioner in designing requires a knowledge of the operations and experiments carried on in the several departments of a technical school. An ordinary architect would be incompetent to design such a school, unless either he had made such schools as those of Finsbury College, or Owens College, Manchester, a study, or had himself gone through the course of instruction in a technical college. It has almost become, in fact, a specialist's branch. Another class of recent practice is that employed in the design of baths of various kinds, medical and otherwise; establishments for the treatment of special diseases and surgical cases. Medical schools come within the technical school class. Schools of art, museums and libraries, make a large and lucrative field, to say nothing of such special buildings as astronomical observatories and those for particular manufactures.

The old masters of the art knew nothing of these multifarious kinds of structure. Houses, churches, schools, almshouses, and hospitals comprised almost all the buildings for which an architect was called in. Their range of knowledge was limited to types for which centuries had supplied precedents. With the reorganisation of society, and the progress of knowledge and manufactures, architecture has vastly widened its sphere; it has become the art expression of not only religious worship and of man's dwelling, but of every conceivable form of human life and intellectual employment. There can be no wonder that in the work of incorporating modern elements and factors of civilisation the architect must constantly be coming into conflict with them. Every new material he has to subject to the crucible of his intellect, to turn or mould it into some form that shall not do violence to his taste; every mechanical appliance has to be shaped and fitted into the structure, and each new requirement demands a careful reconsideration and adjustment of plan and design. A hydraulic lift may become a disagreeable or a pleasing feature in a central hall, according as the architect has neglected to arrange for it, or has made it a feature of his design. Wherever we find an appliance overlooked, the result is an excrescence—it looks and strikes one as an after-thought. An electric lighting installation need not be a severe tax on the resources of the architect, though it is better thought of and provided for when the plans are being prepared. A ventilating system is now an absolute necessity to buildings. A few years ago all kinds of nostrums were introduced; churches and schools were disfigured by all sorts of cowls and excrescences because architects had not realised the necessity of making the outlets visible features on their buildings. All kinds of ugly terminals were invented, and many architects began to imagine that ventilating appliances must be ugly, and that no building could be ventilated without being spoiled architecturally. Thanks to the persistent efforts of a few sanitary engineers, ventilating appliances are now rendered anything but obnoxious; the "air pump" and patent "pneumatic" ventilation, and other systems founded on the vacuum-creating principle, are introduced on buildings as features as necessary as bell turrets and chimneys, and these forms have been architecturalised and adapted. The systems of heating have long troubled the art architect; but if he only makes up his mind about the principle he cannot fail to meet with advertised systems which leave little to be desired. Gas and electric lighting claim a share of attention of the architect; but the arrangement of burners, the shapes of lamps to give the highest illuminating power, incandescent and arc lamps and their details have been too long overlooked. Even such structural matters as fireproof floors and construction and patent floorings have been regarded with aversion, and left to the engineers and manufacturers from motives that are sufficiently obvious. "Discretion is the better part of valour." An architect cannot master all these details of building; imperfect knowledge cannot be pleaded after failure, and he is the wiser who submits his rough plans to the engineer before completing his contract drawings and specification, rather than let them go to contract with incomplete arrangements, and then enter into subsequent contracts for ill-devised schemes that must inevitably lead to disappointment.

CHURCHES STRUCK BY LIGHTNING.

THE severe and almost unprecedented thunderstorm which broke over the south-western parts of the Metropolis last Wednesday week has left marks of its ravages, not only in the bursting of sewers, the flooding of basements, and the tearing up of road surfaces, but in the injury the lightning discharges inflicted on several churches in the neighbourhood. The edifice which suffered most in London was Christ Church, Endell-street, and so much has it been damaged that the accustomed worshippers, unwilling to remain in the church last Sunday, were compelled to use the dining-hall of the adjacent workhouse. A general examination of the building has revealed not only a dangerous condition of the stone spire, which is a prominent object in Endell-street, where it stands out beyond the line of the adjoining buildings, but holes in the roof, and damaged masonry at the side of church. Newspaper reports, which are generally of an exaggerated kind, have given even more alarming accounts of the injury done than really appears. Two large openings are made in the spire; one about 10ft. from the summit is not quite so large that a "cab and horse" could be driven through it, as one account stated, though it is nevertheless a very ugly gash, and occurs on the eastern face of the spire; the other is lower down on the north-east angle. This angle and adjacent faces have suffered the most. The whole masonry, in fact, from the top downwards, is badly shaken, the angle is broken in several places, and a large fragment of stonework has been knocked off it just above the lower gablet of the eastern face of spire. There are besides apparent bulgings and a general shaking or displacement of the courses of masonry. The electric current appears to have tracked out the iron cramps of the stones, and to have shaken or split all masonry connected by them. In the St. Giles's workhouse yard adjoining we find it took a horizontal course along the iron railings and struck a large quoin stone of one buttress just where the iron railing is stayed to the buttress. The pieces of stone that fell from the spire have made a hole in the roof, and have smashed a piece of the coping, a man at the time in a box below having a narrow escape. A hoarding has been erected round the church in front, and Messrs. Robert Aviss and Co., of Baltic Wharf, Putney, have commenced the operation of erecting a scaffolding round the spire to take it down previous to re-erection, which will have to be conducted with considerable caution. The reconstruction is being undertaken by the County Fire Office, Mr. Coleman being the foreman of the work.

The church is a Gothic structure, of Early English character, designed by the late Mr. B. Ferrey, with some good details. It has a short nave, side aisles, and chancel with side galleries, the tower and spire being at the west end adjoining the nave. There is little of architectural interest except the spire, which forms a feature in the street, and we hope it will be re-erected on the old lines. It is of plain masonry, with two tiers of spire lights and angle beadings, the base being of the broach form. The angles look much serrated, and the stone generally is crumbling. Little less than rebuilding will be judicious. One important point to remark is that this spire is without a lightning conductor, though it is quite 120ft. or 130ft. in height. Reports also bring the news of damage to the tower of St. John's Church, Walham-green, which was struck on the same evening. A large piece of the brickwork of pinnacle on the north-west angle of the tower was knocked out, the bricks being hurled over to the southern side of the church. The pinnacle has been damaged in two places, the lightning having glanced down and struck the inside of the parapet of tower, making a hole in the wall. Of the other churches that were struck, of which reports are to hand, is one in Elm Park, Tulse Hill, a small temporary structure in the parish of Holy Trinity, dedicated to St. Matthias. It is a brick church with galvanised iron roof, and a small bell-turret at one end. The lightning discharge here knocked off the finial and portion of the turret, and tore up the zinc covering of the turret itself. The accident is more remarkable inasmuch as the turret is low, not in fact so high as most of the neighbouring brick houses and chimneys, showing that the metal finial attracted the fluid, or became the easiest passage between the clouds and earth at this point. Holy Trinity Church, Tulse Hill, which stands on a considerable eminence, and which has a lofty spire, but without a conductor, was only slightly touched; the tower and spire do not appear to have been struck at all, though reported to have been seriously damaged in a daily paper—the mistake having probably arisen from confounding the smaller with the mother church. Many other church steeples have been more or less damaged in other parts of the country.

What is worth particular notice in these accidents is that the buildings struck are without the protection of lightning conductors. Why are they unprovided? To us it appears remarkable that architects and church builders should be so indifferent to the safety of their buildings as to leave costly and handsome spires like that of Holy Trinity, Tulse Hill, without a conductor. We are no longer in any doubt about the protection afforded by these silent dischargers of the electrical fluid. A few people at one time entertained the idea that lightning conductors drew the lightning to the fabric and really increased the risk, without considering that their presence dissipated the electricity, silently causing its discharge either from the clouds downwards or the earth upwards. Many people, and we are sorry to include architects and well-informed persons, entertain very wrong and indefinite ideas of the nature of electricity and the operation of a conductor. They think it acts only in one way, as drawing off the electricity of the clouds harmlessly to the ground, whereas the conductor relieves the earth also of its accumulation. It is a path of least resistance between the overcharged cloud and the earth. The electricities—and these are always of two opposite kinds—act in two ways; when the discharge is upwards, the earth is positively electrified and the clouds negatively, and the conductor is simply the conveyer or dissipator of the charge. A "flash" is imminent when there are two points—one of high tension, in the neighbourhood of the overcharged cloud, and the other of lower tension—say, the earth—and

in obedience to the universal law of equilibrium, or balance of forces, the discharge takes place along the most favourable passage. If that passage is not provided the flash is eruptive and dangerous. If any object within its range is a bad conductor, the electric spark strikes it with force and destroys whatever may be in its path. It ought not also to be forgotten that every thundercloud exerts an inductive action on all bodies within a certain radius, and these bodies become charged with the opposite electricity. But this action cannot take place where a lightning-conductor is, for its presence prevents the accumulation of electricity, either in the cloud overhead or in the earth, the negative charge is being constantly and silently drawn off from the soil by the positive charge in the cloud, and *vice versâ*, and the two are restored to their natural state. So that in point of fact the conductor prevents the accumulation of these electric states, and restores the clouds to their natural condition. In this respect it may be likened to a pipe conveying liquid between a higher and a lower level. In short, the presence of lofty buildings with lightning conductors dissipates thunderstorms instead of, as usually thought, attracting them. The highest objects are exposed to the electric discharge, as it is upon them the density is greatest. There are a few points to be attended to in fixing conductors to buildings: the rod or part above the structure should be terminated in a fine point, the conductor should avoid angles and be placed in electrical connection with all metal work near its course, zinc roofs and iron gulleys, and there should be a good branched earth connection by means of well or hole filled with powdered coke.

Architects may learn all they want to know from any work on the subject, such as that by Mr. Anderson. They would, at least, be acting wisely to provide lightning conductors on every building of any height, instead of leaving them to bare chance. Every church tower and spire, every lofty chimney, turret, or gable summit, ought to be provided with a conductor for the purpose of preventing the accumulation of electricity at that point. Expense is trifling when the building is in progress. Afterwards it may become a very expensive affair. Hundreds of our great buildings and cathedrals have been saved by the expenditure of a few pounds, that is considered too expensive on structures that have cost thousands.

SCHOOL-WORKSHOPS.

So much has already been said and written about technical instruction, and so few people have made up their minds concerning what is meant by these words, that it is satisfactory to learn from the tenour of the Bill brought forward in Parliament that the idea they should convey is nothing more nor less than the subjects of science and art included in the "Directory" issued by the Science and Art Department. When South Kensington first began to attract attention and made a bold bid to take the art of the country under its wing (it did not tackle the science until much later), one of its greatest triumphs was the popular doctrine that art was a subject which had to do with everyday life. People learned for the first time that in choosing their wallpapers and in embroidering their babies' dresses, they were really unconscious votaries of art, and though the adoption of an art career involved a preliminary course of freehand drawing and perspective, there was yet for the many an art life outside of this drudgery, intimately bound up with their daily occupations. And now, again, after long years, and in consequence of the desponding cry of impending ruin, in some way or other the result of foreign competition and the absence of technical training, South Kensington again comes forward to the rescue, and blandly assures us that we have already made vast strides in technical education, and that we possess in the numberless science and art classes connected with the Department the instruction which is to save the country from overthrow and to enable us to displace the foreign rivals, of whom some would seem to stand so greatly in dread. Far be it from us to diminish in any way the feeling of security which must arise from such an assertion, or to offer any other interpretation of the nature of the training which has contributed so greatly to the acknowledged superiority of the foreign workman, notwithstanding the absence abroad of a Science and Art Department, and the failure of Continental nations to accept in any shape or form our English system of "payment on results." We would not, indeed, willingly intervene, or dispel in any way this pleasant dream, but for the fact that we are convinced that the above classes, be they "technical" in its true sense or not, are not the classes which will satisfy the aspirations of those ardent advocates of instruction in technology who have forced upon us the contemplated legislation, and who have stirred up the present movement. In Birmingham, Sheffield, Bradford, Preston, and a host of other manufacturing centres there is a cry for manual instruction, and for the creation of schools equipped with machinery and apparatus for the practical teaching of certain branches of skilled handicrafts allied to the industries with which these various towns are connected. In these schools, side by side with the practical teaching of the trades, they would have a sound and graduated course of instruction in the arts and sciences which underlie their manufacturing operations in them, in short, the dyer shall learn chemistry, the laws of colour, and the structure of the fibres of the various raw materials; there the metal worker shall acquire a thorough acquaintance with metallurgy, mechanics, and machine drawing; while, in addition to this theoretical instruction, the dyer and the metal worker shall alike have an opportunity of putting their theories to the test on actual machinery and plant of the latest and best description. This conception of a technical school, be it right or wrong, is quite outside anything to be found in the programme of the Science and Art Department, and such buildings would need for their erection and maintenance a far heavier call upon the ratepayer than the Chancellor of the Exchequer would seem to contemplate. Let us here glance for a moment at the students and the nature of the instruction which Mr. Goschen believes will be given under the Act. The teaching will be provided for children—boys apparently—who have reached the sixth Standard in the Board school, or those whose elementary education has attained to this level; children, therefore, still of the school age—13 years and upwards—whose parents can afford to keep them at school for a year or two longer. Mr. Goschen tells us that there are some 60,000 children in the kingdom who are qualified, and of this number he assumes that 32,000 are boys. It is estimated that only 4,000 of these boys in any one year would avail themselves of the proffered training, or, as the course would extend over three years, there would be 12,000 lads at one time in the various technical schools. It would appear, moreover, that the nature of the instruction to be afforded under the Act is precisely that now given in some of the best of the existing higher grade Board schools. It is not easy, under these circumstances, to understand why special legislation is needed, or the reason for any additional call upon the ratepayer, since under the Act of 1870 there is no difficulty in equipping and maintaining these higher grade schools. It is true that when the seventh Standard has been passed, the Act makes no provision for the continuance of the child in the elementary school; but here the Science and Art Department steps in and offers to the "Organised Science School" a yearly capitation grant, under certain conditions, of 10s. per student and large payments on results. So liberal are these payments that at Manchester and Birmingham it has been found that such schools can nearly be made self-supporting, and with a slightly-increased fee and the power of rejecting all but the best children we believe such schools could be carried on without dipping into the ratepayer's pocket. But even with the wide powers which can be taken in the choice of teaching under the Science and Art Department, no mention is made of workshops for practical instruction in the use of tools, and no grant can be earned for teaching of this kind, which is manifestly costly, and requires special preparations. Nor can any aid be obtained for work of this character from the City and Guilds of London Institute, for it is a condition, in the case of their payments, that the student shall be practically engaged in the trade in which he is being examined, and schoolboys would at once be debarred under this clause from all participation in the grants made by the City Guilds. How, then, have these workshops been obtained in the past, and in what way does the scheme of technical education which has been under discussion in the House of Commons contemplate their future creation? The answer to the former part of the question is, we believe, that their creation has hitherto been due to voluntary subscription or to the munificence of some individual member of the School Board. In reply to the latter part of the question, we must own that unless the Department of Science and Art should enlarge the sphere of its operations, we see no place for school workshops in the future. Science laboratories with all necessary fittings can be obtained under the regulations of the Department; but benches, and lathes, and tools for wood and iron working are not contemplated in the Directory. Workshops of the kind we have in view exist in connection with many of our public and middle-class schools; but in all these cases the absence of any influence upon the future artisan, or of any action in overcoming foreign competition, renders them quite beyond the scope of our present observations. What many of us have hoped for in the promised scheme of technical education was the provision of good night schools, resembling the best Continental Continuation Schools, or the Industrial Schools of Belgium, in which the young workman should have every opportunity for learning the theoretical branches of his trade, and of seeing how to apply his theory to the operations carried on in the factory, on good working models of the machinery, if not upon the manufacturing plant itself. Our ideal school would be one attached to the factory, as has been so ably done at Salford by Mr. W. Mather, M.P., where the apprentices and lads employed in the works learn the science subjects most likely to be useful to them, and have every facility for making themselves familiar with the actual machinery in the works. Good mechanical drawing must be the basis of all teaching in such a school, and the syllabus of the Science and Art Department will supply all that is required for the theoretical branches of every important industry.

No doubt in course of time, when technical schools abound, and when the ratepayers have discovered how small a sum they need add to the large grants which the Treasury will furnish, it may be found expedient to add somewhat to the sphere of the Science and Art Department, and to absorb, may be, the work so well begun by the City Guilds; but this time is, we think, as yet far distant. In the immediate future, the technical train-

ing which the Government has to offer us is that provided by the Science and Art Department, and the ratepayers will only be called upon to supplement the Government grants in supporting higher grade schools. The idea that workshops attached to Board schools for teaching the children carpentry and metal work can really and indeed provide "Technical Instruction," or that the creation of a reasonable number of such workshops will exert any appreciable influence in diminishing foreign competition, is too puerile to merit serious attention.

WORKS IN WATER.—XXXIII.

(*Continued from page 946, Vol. LI.*)

FLOATING BREAKWATERS.

A REDUCTION in the cost of breakwaters is very desirable if it can be done with reasonable prospect of the endurance of the structures to be substituted for them, or, otherwise, that they should be made in such manner that the destruction of parts may be easily repaired, while the destruction of one or two parts on any one occasion may not render the breakwater use-

Fig. 1

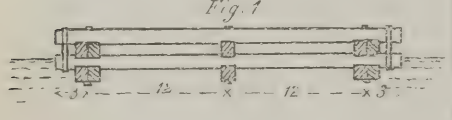

Fig. 2

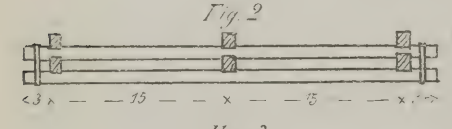

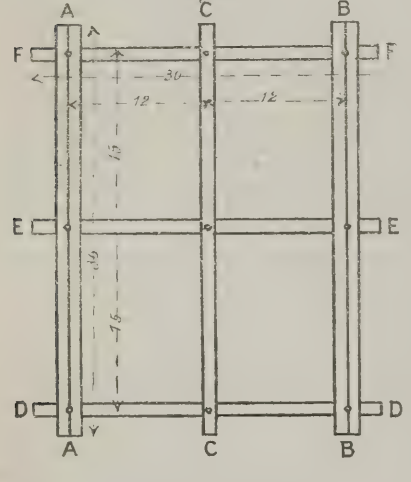

Fig. 3

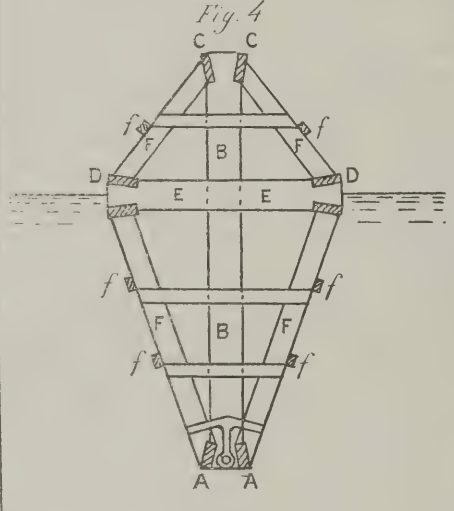
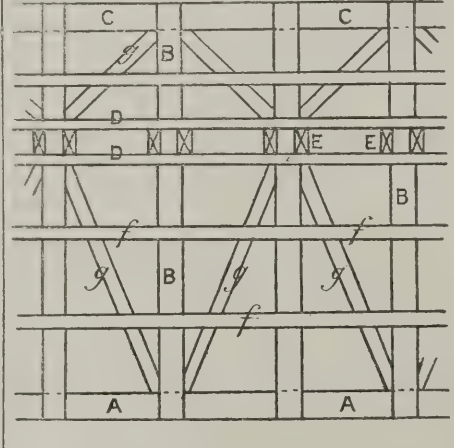
less. It must be admitted that the great breakwaters we have hitherto commented upon—those of Holyhead, Plymouth, and Dover—have been excessively costly, and although the cost of the Portland Breakwater has been less than that of the others, being done by the labour of convicts in a great measure, yet £1,033,000, or £127 per lineal foot, which is what it did cost, makes it still an expensive work. So far as harbours are necessary for national purposes—as all these were when they were made, and, indeed, are so still—no outlay of money upon their construction can be too much which is necessary to make them large enough and secure against the ravages of storms round the coast, with the additional requirement, in the case of some of them, that they afford a means of repairing, refitting, and victualling of ships of the navy in case of war; and the establishment of harbours such as these is in the first instance chiefly a question of site. If a harbour of this sort were required in any particular position, it would go hard, indeed, with the engineer if he could not find means to construct a breakwater to protect it from the effects of the sea in gales of wind, however much exposed the situation might be, or however deep the water; and when the enormous expense of some of the breakwaters is referred to, it should be remembered that the engineer has been called upon to do his best in the place where the harbour was required to be made; and perhaps if the situation and depth of water were considered when the great expense is referred to, there would be less wonder at it, and fewer remarks upon the subject. Nevertheless, it is highly desirable to reduce the cost of breakwaters by any means which afford sufficient protection, and we intend to examine with that view the proposals which have been made for the formation of floating breakwaters, which, it need not be said, would be very much less costly than those founded on the bed of the sea, in anything like a depth of water of 40ft., which appears to be the minimum

Fig. 4





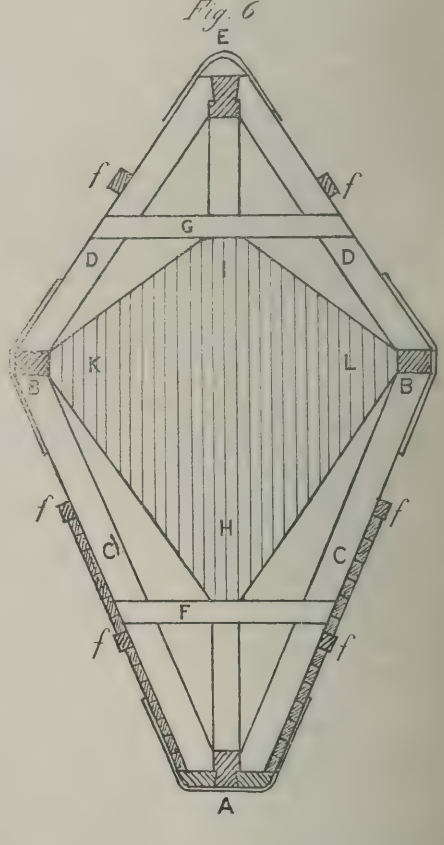


Fig. 5

which can now be recommended for the entrance of large ships, seeing that some allowance must be made for the send of the sea when entering at low water, and for a sufficient clearance of the bottom; and it is a feature distinctly favourable to the question of floating structures that the depth of water is, within certain limits, of but little consequence. It seems to be almost necessary to provide 40ft. of water or more at the entrance, although less than that may be sufficient within the harbour; and the reason, we take it, why the depth at the entrance should be greater than that inside is that in rough weather this allowance must be made for the height of the waves, first above the mean level—say 6ft. or 7ft.—and then as much below it, so that to prevent ships' bottoms touching the ground the depth outside the entrance should be one or two fathoms greater than it need be inside. Such considerations as these determine the position of the entrance as regards the distance out from shore, and the draught of water of the vessels to be provided for determines the line of breakwater, and consequently the depth in which it must be constructed. This depth, moreover, must be that below the level of low water, so that, all things considered, a breakwater built of stone or concrete is necessarily an expensive construction. This has led at various times to proposals to effect the same object by floating structures, so that the depth of water would be of less importance. The proposal of Mr. John White was to frame balks of timber together in the manner shown in Figs. 1, 2, and 3, the sizes of the balks being as large as could conveniently be procured, and laid in the following manner: First, double balks, A, A, and B, B, with a single balk in the middle between them, C, C. Upon these, crosswise, were single balks D, D, E, E, and F, F, all being bolted together vertically at the intersections, and for situations not much exposed this frame was considered sufficient; but in more exposed places a greater depth of timber was

Fig. 6

recommended, and in these the double and single balks were repeated, one upon another, as shown in Figs. 1 and 2, the whole being bolted through at the intersections, and also strongly hooped at the projecting ends. The frames were to be attached by means of cables to anchors or other moorings at the bottom. It was foreseen that from various causes the buoyancy of the frames as here described might become insufficient to float them properly, and in that case buoys were to be attached to the frames, or any other usual means taken to keep them afloat.

The proposal of Admiral Tayler, which he carried into effect on an experimental scale in this country and in a practical one at one of the French ports, was to build a breakwater of timber, of any length desired, made up of separate lengths of about 90ft., each length being 18ft. high and 10ft. wide. He calculated that the immersion would be two-thirds, so that there would be 12ft. in water and 6ft. out., the form being that shown in Figs. 4 and 5, Fig. 4 being a cross

section and Fig. 5 a longitudinal elevation of a part of one length. The construction is first to lay a double sill, each piece 12in. by 8in., A, A, in each figure. The length of 90ft. would require that the pieces be scarped, but this would he no material weakness in a floating structure. Upright timbers, 12in. by 10in., B, B, are placed upon the sills, 4ft. apart in the clear. Each of these pieces is 18ft. long, the bottom being cut to a dovetailed form and set between the sills. The top is cut in like manner to receive two cap sills, 15in. by 5in., C, C, bolted together crosswise, as are also the bottom sills. The next principal parts of the structure are two double shear planks, D, D, each piece 15in. by 5in., the outer edges of each pair being placed 10ft. apart horizontally, and held in position by a cross beam E, E, the ends of which are cut in a dovetailed form, and the shear plates let into the shoulders. Each of these cross beams is in two pieces, 12in. by 6in., one piece on each side of the upright, both the upright and each piece of the beam being sunk an inch at the crossing and bolted through. The outer timbers F, F, 9in. by 6in., and 21in. apart in the clear, are tenoned into the sills and shear planks. This forms the main frame, but further timbers are required to stiffen it, as the walings *f*, *f*, 8in. by 8in., which are connected across the frame by ties 10in. by 5in., double, one piece on each side of each main upright, each piece being sunk an inch at the crossing as in the main beam. Also it is necessary to introduce braces *g*, *g*, to prevent "working" of the joints in a longitudinal direction.

The inventor described this floating structure as a method of abating or lessening the shock or force of waves, and of reducing them to the comparatively harmless state known as broken water, and thereby preventing the injury done to, and increasing the durability of, breakwaters, piers, wharfs, and embankments, and also of adding to the security and defence of harbours and other places exposed to the violent action of waves. But there are two purposes to which the invention was to be put: one, to protect other works; the other to act as the work itself which should protect a harbour; and in this respect Admiral Tayler claimed to have substituted for a solid fixed resisting body, such as a stone breakwater, a yielding body, partly floating on the water and partly resting and vibrating upon its keel at the bottom, such yielding bodies being linked or connected together, the waves consequently flowing over or under the yielding bodies, according to circumstances, and becoming divided or broken, and thus deprived of further mischievous action. These yielding bodies constitute what he called his floating breakwater, and they might be formed in various ways, and built in many different forms, and of any proper material, but still retaining as their essential principle that of yielding to the shock of the waves, instead of opposing them. For attaching the floating breakwater to its moorings there are two iron straps, 7in. by 1½in., made in the form T, one being placed on each side of the upright B, second or third from each end of the breakwater, or rather each length of it, and the mooring chains are attached thereto by a shackle. Ordinary mooring chains, if of sufficient strength, would be so ponderous that they would detract from the buoyancy of the breakwater, and an ingenious system of mooring was proposed, consisting of 12ft. lengths of straight-grained red fir, larch, or American ash, which would bear a much greater strain in tension than an equal weight of iron. These lengths of timber were 9in. square, joined by shackles, and a link of common mooring chain. Admiral Tayler proposed for certain situations another kind of floating breakwater, which consisted of a framework about 30ft. in height and 18ft. in width, constructed as follows, and of which Fig. 6 is a cross-section:—A sill A, 16in. by 14in., is laid from end to end of the breakwater, or each length of it, with side pieces each 16in. by 8in., shouldered into the central sill. At about 18ft. in height above the bottom, two sills, B, B, were laid, the width apart to the outside of each being 18ft. Between the bottom sills and these main sills at the line of flotation, the side timbers C, C, were inserted, tenoned into each sill above and below, and above these main sills raking timbers D, D, were set, meeting in a cap sill at the top E. These timbers were stiffened by wallings *f*, running the whole length of the structure. Cross beams F and G were bolted to the outer timbers at the height 16ft. apart in the clear, short pillars being inserted between these and the two sills at the bottom and top respectively. Between these two cross beams, and between the two main sills B, B, a watertight framed and planked caisson H, I, K, L is fixed, being attached thereto with iron knees and bolts. The caisson is covered with 4in. pine planking, the joints being rebated, and the lower part of the external frame is also covered with 4in. planking from the bottom sill to the second waling on each side. The bottom pieces are all strongly bound together by iron straps reaching 4ft. up each side of the main timbers; and the top is similarly treated.

BUILDING MATERIALS.—II.*

By W. Y. Dent, F.C.S., F.I.C.

(*Concluded from p.* 279.)

THE selection of magnesian limestone for the Houses of Parliament was decided upon chiefly on account of the very excellent state of preservation in which this stone was found at the cathedral church at Southwell, in Nottinghamshire, Roche Abbey, near Tickhill, and the castles of Conisborough and Bolsover. The particular stone chosen was that from the quarries at Bolsover, in Derbyshire, whence the stone used for the church at Southwell had been obtained. The stone that could be supplied from these quarries was, however, found to be too small in quantity for so extensive a building, and blocks of sufficient size were not procurable; other sources of supply had consequently to be found, and the North Anston quarries, on the borders of Yorkshire, were determined upon. The choice of magnesian limestone, notwithstanding all that has occurred, in connection with the defective condition of many portions of the building at Westminster, cannot be regarded as altogether an erroneous one. Magnesian limestone had long been regarded as affording an excellent material for building purposes. It was, in the opinion of Sir Christopher Wren, only inferior to Portland, and examples are not wanting which afford evidence of its capability of bearing exposure to such an atmosphere as that of London without injury, of which the Museum of Practical Geology in Jermyn-street may be quoted as an instance. The greatest care was taken in selecting the kind of stone to be used; a Royal Commission was appointed, consisting of men eminent for their geological attainments as well as for their practical experience, who undertook a laborious investigation, visiting all the principal quarries in England, and examining 150 varieties of stone. The cause of the unsatisfactory condition of much of the stone employed in the building is unquestionably due to want of inspection at the quarries, and—as a necessary consequence of this laxity of superintendence—the inefficient manner in which the stone was worked. We find stones taken from the same part of the building, varying materially as regards their porosity and physical character, to such an extent as could not possibly have occurred had proper precautions been taken for preventing the arrival in London of any stone of inferior quality. The securing a proper supervision over all quarrying operations is of quite as much importance as care in the selection of the description of stone most suitable for any building operations, of the truth of which the Palace of Westminster affords, unfortunately, plenty of evidence. A very excellent stone of this class is obtained from Huddlestone, situated between Sherburn and Tadcaster, consisting of 54 per cent. of carbonate of lime and 41 per cent. of carbonate of magnesia, of which we have an example in London in the cross erected in front of the Charing-cross Hotel. Building stone of good quality is obtained from various parts of the magnesian limestone district, differing in composition as regards the relative proportions of lime and magnesia. The nearer the composition of the stone resembles that of true dolomite, and the more crystalline is its character, the better building stone is it likely to prove. The Bolsover stone, originally selected for the Palace at Westminster, contained 51 per cent. of carbonate of lime and 40 per cent. of carbonate of magnesia. It would be useless to attempt to give anything like a detailed account of the vast number of very excellent building stones with which this country abounds, but I shall endeavour to make a selection of such as may best serve to illustrate the chief differences that exist between them, both as regards their chemical composition and physical structure. In examining a specimen of stone, our first inquiry would naturally be directed towards ascertaining its chemical composition, so far, at all events, as would be requisite for deciding upon the class to which it belongs, whether it is a sandstone or a limestone, or partakes of the character of both. Having determined this point, we should ascertain the condition in which its constituents exist, whether crystalline or otherwise, and proceed to a careful examination of its physical properties generally, such as its hardness, density, and strength, and also its porosity, as shown by the amount of water it will absorb. It is upon these physical properties that the value of a stone mainly depends, for we find sandstones containing very nearly the same amounts of silica, or limestones containing the same proportions of carbonate of lime, and yet differing widely from each other in their relative value for building purposes, their durability or otherwise being mainly dependent upon their physical structure. In conducting an investigation of this nature, the examination of sections of stone under a microscope will afford much useful and valuable information as to the nature and character of the minerals of which it is composed. As regards the more practical tests, it is very desirable, if not absolutely essential, that they should be conducted in as uniform a manner as possible, otherwise the results obtained are no longer capable of being compared with each other, and consequently lose much of their value. The capability of stone to resist a crushing force is usually stated in the circulars issued by quarry owners, as being represented by the number of pounds per square inch, or tons per square foot, which it is capable of bearing without breaking; but these results are not strictly comparable with each other unless the tests have been conducted in the same manner, and with blocks of the same size. The method most generally adopted is to subject 6in. cubes, bedded between pieces of pine ⅜in. in thickness, to hydraulic pressure, noting the amount of force obtained when the first crack makes its appearance, and also when the crushing takes place. Another useful test of the strength of stone is to expose repeatedly small slabs saturated with water, and inclosed in a metal case, to a freezing temperature. The density may be taken approximately by simply weighing 6in. or 12in. cubes, if carefully cut; but for more accurate determinations, the usual manner of taking the specific gravity of solids by ascertaining the difference in weight in air and when immersed in water may be resorted to. For this purpose, small 1in. or 1½in. cubes are the most convenient sizes. The specimens, previously dried and weighed, should be rendered impervious to water by immersion for an instant in melted paraffin, or by coating them with a thick solution of shellac in methylated spirit, and again weighed. The difference between the specific gravity of paraffin or shellac, and that of water, is not sufficient to give rise to any serious amount of error, whilst the necessary correction for this difference can be easily calculated for, if greater accuracy be desired. In drying specimens of stone, care should be taken to avoid too high a temperature; if time allows, it is preferable to do so

* Being the Cantor Lecture delivered before the Society of Arts.

by simply exposing them to the air of a warm room, and under no circumstances should the temperature be allowed to exceed 212° Fahr. When dried rapidly at this temperature, the specimens should be allowed to remain for an hour after removal from the drying chamber, in order that they may cool down and take up their hygroscopic moisture before weighing. The variations that exist as regards density in different kinds of stone are considerable. The lighter descriptions, such as Caen and Bath stone, weigh from about 116lb. to 123lb. per cubic foot, whilst the heaviest, such as granites and marbles, will weigh from 165lb. to 175lb. The amount of water absorbed by stone is sometimes determined by exposing the dry specimen to an atmosphere saturated with moisture for forty-eight hours, a method which gives very good results when making a careful comparative examination of two different specimens of stone; but a more rapid and sufficiently accurate method for most practical purposes is to immerse a slab about 3in. square and ½in. in thickness in water, until no further bubbles of air make their appearance, when it is taken out; the water on the surface is removed with a piece of bibulous paper, and the increase in weight ascertained. The less durable kinds of stone, such as Caen stone and many descriptions of Bath stone, absorb as a rule more water than Portland, Ancaster, or Doulting, whilst granite and marble may be regarded as non-absorbent. In a report to a Commission appointed at Munich on the subject of stone, the following tests were proposed for adoption:—1. Determination of the salts soluble in water. 2. Determination of its porosity by ascertaining the amount of water taken up by capillary absorption during twenty-four hours, as well as that absorbed by total immersion. 3. Exposure of a sample saturated with water and inclosed in a metal case to a temperature of from 5° to 14° Fahr., such exposure to be repeated ten times. In carrying out experiments with stone, it is always desirable to have a specimen of stone of known quality, and belonging to the same class as those under examination, included in the investigation, since it is difficult to insure the conditions under which experiments are made being precisely the same under all circumstances. However much care may be taken in the examination of specimens, it must never be forgotten that it is absolutely necessary, before deciding on the relative merits of different kinds of stone as to their suitability or otherwise for any special purpose, that the quarries should be visited, and the several beds carefully inspected, for in almost every quarry, whatever the description of stone may be, a very material difference will be found to exist in the quality of the stone yielded by its several beds. Samples of stone from the same quarry, and sometimes even from the same bed, in which no practical difference can be detected by chemical analysis, will not unfrequently be found to exhibit considerable variations in physical structure, a knowledge of which can only be obtained by actual inspection of the stone *in situ*. No opportunity should be lost of obtaining information as to the condition of buildings in which the stone has been employed, and all quarrying operations should be conducted under efficient superintendence, in order that no stone of inferior quality should be permitted to leave the quarry. Time should be allowed for what is termed the "quarry watèr" to dry out, by which the surface of the stone is hardened, and the tendency of pieces to split off, so frequently exhibited by newly-quarried stone, especially in frosty weather, is decreased. The hardening which takes place during the process of slow drying, by exposure to the air, is probably owing to the deposition within the pores of stone of mineral matter previously held in solution by the quarry water. This beneficial result is not obtained when any process of artificial drying is adopted, which is too rapid to allow the matter deposited to assume such a crystalline structure as results from the slow drying effected by simply exposing it to air. Moreover, such artificial drying may have an injurious effect, on account of its giving rise to unequal expansion and contraction of the surface of the stone as compared with the moist interior.

PRESERVATION OF STONE.

The question of the preservation of stone is one upon which much time and trouble have been expended without, however, leading to the attainment of any very satisfactory results, inasmuch as when good stone is employed no preserving process is required, and if, unfortunately, the best has to be made of inferior stone, it is only in exceptional cases that the cost and trouble involved in the adoption of any such process is likely to be incurred upon an extensive scale. When the extent of the decay which had taken place in the stone of the Houses of Parliament was first fully realised, it created a good deal of excitement, and a Government Commission was appointed to inquire into the subject, who invited proposals for arresting its progress. In answer to this invitation, a great number of projects were brought forward for the attainment of the desired object, differing widely from each other in their character, many of them being the outcome of much thought and careful study of the question, whilst others were of a very crude nature and had no pretensions to any merit. The principle upon which any process of this kind depends for success is evident, for since it is by means of water that the acid matters which act so injuriously upon stone obtain access to it, any process which succeeds in filling up the pores with some material of a permanent and unalterable character must be likely to act as an effective preservative. This, at first sight, would seem very easy to accomplish. There is no difficulty in closing the pores of a piece of soft chalk or Caen stone, so as to harden the surface and make it non-absorbent of water. When, however, stone is once in position, and we have it in the form of a vertical wall, the task is a more difficult one. Under such circumstances it is impossible to make any solution penetrate to a sufficient depth by a single application; it requires to be frequently repeated, beginning with very weak solutions, before the stone can be made to absorb it in sufficient quantity, or to any considerable depth; whilst if it be a mere surface covering, it is likely to be of little more use than ordinary painting, which requires to be renewed every four or five years. Since we know that of all the constituents of stone there is nothing more permanent than silica, and that the combinations into which this substance enters are numerous and varied, and, moreover, that silicates are capable of being readily manufactured by easy and inexpensive processes, it was natural that some solution of silica should have been amongst the first to suggest itself to the chemist as likely to prove eminently successful as an application for the hardening of stone. Accordingly we find that, as far back as the year 1826, Professor Fuchs, of Munich, proposed an alkaline solution of silica, under the name of soluble glass, for the solidification of stone. Professor Kuhlman, of Lille, subsequently read a series of papers before the French Academy of Sciences, on the application of water glass (silicate of potash) to the hardening of stone. The great drawback to the use of the alkaline silicates is the efflorescence to which they necessarily give rise. In order to avoid this difficulty, other methods were proposed some years later to the Commission appointed to inquire into the condition of the stone of the Houses of Parliament. Among these was a solution of baryta, followed by a solution of superphosphate of lime, which produced a precipitate within the pores of the stone of insoluble phosphate of lime and phosphate of baryta; another was silicofluoric acid in conjunction with baryta, both of which processes were attended with a certain amount of success. Limestone may also be rendered non-porous by the application of oxalate of alumina, which produces an insoluble precipitate of oxalate of lime and alumina. Any of these processes fill up the pores of the stone with material of a permanent character without giving rise to the production of soluble salts which require to be washed out. The use of organic substances, such as linseed oil, affords considerable protection for a time, but organic matter of this description is liable to be changed by combining with the oxygen of the air.

In the case of ordinary painting, it is the oxidation of the oil of the paint that causes the paint to scale off in the course of a few years, the oil being converted into a brittle resinous substance. The rapidity with which guttapercha, when exposed in thin strips to influence of light and air, loses elasticity and is converted into a brittle material, affords a good illustration of this oxidation of organic matter. Of materials not belonging to the inorganic or mineral class, one of the least subject to any change is paraffin, and on this account the use of paraffin applied in various ways, sometimes in solution and sometimes in a melted state, has been at various times suggested as a means of preserving stone by preventing the penetration of moisture. We have a striking example of the effect of climate upon stone in the Egyptian obelisks, which, after remaining unaltered for thousands of years in the dry climate of Egypt, are no sooner removed to such an atmosphere as that of London than they begin to show signs of disintegration and decay, as is more or less the case with all the three obelisks that have been brought away from Egypt—one erected in New York, another in Paris, and a third on the Thames Embankment. Their condition is no doubt, to a considerable extent, due to injuries received whilst they laid neglected on the sands of Alexandria, and partly to such as were unavoidable in transporting them to the several positions they now occupy. The decay that has taken place in the New York obelisk appears to have been very much greater than is the case with the one erected in London. In a paper read before the New York Academy of Sciences, it is stated that exfoliation had taken place to a serious extent, pieces of considerable size becoming detached from the mass. Attempts at preserving the stone from further decay have been made both at London and New York. The method adopted in New York by the advice of Dr. Doremus consisted in the use of paraffin, which was applied in a melted condition (mixed with a little creosote) to the stone, previously warmed by means of a small portable furnace. In this manner the paraffin could be made to penetrate to a depth of from a quarter to half an inch. A very popular building stone in New York is that known as "brown stone," which, from its liability to decay, necessitates the use of some preservative process, and the paraffin treatment has been employed upon various buildings in New York with results that have been regarded as successful.

With respect to the obelisk, however, the last reports I have seen are not in favour of this mode of treatment. Any process which involves the heating of the surface of the stone must always be attended with considerable risk of failure. The obelisk on the Thames Embankment has also been subjected to a preservative process, but of a different kind. Upon its showing indications of being acted upon by exposure to the atmosphere of London, the Board of Works, in 1879, under the joint advice of their engineer and consulting chemist, intrusted the task of coating it with a preservative solution, consisting essentially of a solution of gum resins in petroleum spirit, to the Indestructible Paint Company. The solution was very carefully applied after cleaning the obelisk thoroughly, beginning with a very weak solution, and repeating the application as long as the stone could be made to absorb it. So far, the application appears to have been of service, but a period of eight years is too short a time to allow of any decided opinion being formed as to the durability of such a protective coating. As regards the Palace at Westminster, the decay, after all, cannot be said to have affected its stability as a building. It has been chiefly confined to places underneath stringcourses or ledges, which are kept constantly damp by the rain collecting upon, and percolating through, the stone above. Some of the finials have also been broken by the rusting of the iron rods that supported them. What is now being done in the way of preservation is to coat such projecting surfaces with mastic or cement, so as to allow the rain to flow off freely, without allowing it any opportunity for penetrating the stone, and to remove decayed and imperfect stone, replacing it with sound material. If care be taken in the selection of stone, it is only under special and exceptional circumstances that it will be considered desirable to resort to methods of preservation, which must necessarily be expensive, and can only be regarded as the best cure for defects that admit of no other remedy.

ARTIFICIAL STONE.

The numerous attempts that have been made at different times to produce an artificial material that should be capable of being used in the place of natural stone have resulted in the very general use of concrete, or materials in which Portland cement is the binding material. The closest imitation of natural stone is perhaps that manufactured by Mr. Ransome, who took out his first patent 42 years ago. It was not, however, until 1856 that any successful result attended his experiments, when he found that by the use of calcium chloride, in conjunction with silicate of soda, an efficient binding material could be obtained that, when mixed with sand, would solidify into a hard mass. By the action of calcium chloride upon silicate of soda, an insoluble silicate of lime is formed, leaving a soluble sodium chloride, or common salt, which had to be removed by washing, an operation which, although apparently very simple, proved to be extremely difficult in practice. In spite of the greatest care it was found impossible to wash out the last traces of soluble salt from massive blocks, and consequently the stone was liable to be disfigured by efflorescence. This stone was subsequently prepared by an improved process, but it cannot be produced to compete with the lower price at which substitutes for stone can be made by the aid of Portland cement. Silicate of soda is readily obtained by boiling flints in a solution of caustic soda under a pressure of 60lb. on the square inch; or it may be obtained by simply boiling certain silicious deposits found in various parts of the world in an open vessel. In certain strata of the lower chalk formation in the counties of Surrey and Hampshire there are beds which contain silica in this readily soluble condition, some of which, in the neighbourhood of Farnham, will yield as much as from 50 to 70 per cent. of silica by simply boiling with caustic soda. The Victoria Stone Company has for the last sixteen years been producing a very excellent material as artificial stone, especially adapted for sinks, flagstones, and landings, which is capable of competing successfully with the best Yorkshire flagging. It may be regarded as a fine description of concrete, being produced by binding together granite siftings by means of Portland cement. Their principal works are situated near the Groby granite quarries, not far from Leicester, and it is the siftings of the broken granite that are thus utilised. These siftings, after being washed, are mixed with Portland cement in the proportion of three parts of the former to one of the latter, sufficient water being added to cause the cement to set. The surface of the blocks is further hardened by being placed in tanks containing a solution of silicate of soda.

There are other kinds of artificial pavement now manufactured, in the preparation of which broken granite and blast furnace slag are employed, but they all depend principally upon Portland cement as the binding material.

TERRACOTTA.

During the last twenty years much attention has been paid to the manufacture of a material to be used as a substitute for stone, which, so far from being of modern origin, is associated with the very earliest history of our race. It is known by the name of terracotta. As regards durability, burned clay is capable of resisting the effects of time to as great an extent as any other material used for constructive purposes, of which we have abundant evidence in the specimens of Assyrian and Egyptian antiquities in the British Museum. The use of terracotta affords facilities for the production of elaborate designs, the clay model itself being converted by baking into a material more durable than stone. It is much lighter than stone, as compared with the crushing force it will sustain; and by the use of different clays a variety of colours may be obtained. Against these advantages must be considered the difficulties presented in the liability of the clay to shrinkage, both in drying and firing, which, in spite of the greatest care and experience, not unfrequently produces distortion from unequal contraction. To the improved manufacture of this material, a great impetus was given by its being adopted to such a large extent for the Albert Hall and other buildings at South Kensington, the perfection to which it has now attained being to a great extent, due to the energy and skill displayed by Messrs. Doulton and Co., as well as by other manufacturers. Success depends upon the use of a due proportion of the several materials employed, on the attention paid to the grinding and mixing, and to the care bestowed during the operations of drying and firing.

FIREBRICKS.

The plastic clays consist of silica and alumina, chemically combined with water. They are hydrated silicates of alumina, their plasticity depending upon the water that enters into their composition. The water, with which the clay is mechanically combined, can be expelled at a temperature a little above that of boiling, without detriment to its plasticity; but the whole of the water it contains cannot be driven off without raising the temperature to dull redness. Silica, alumina, and lime are all separately very infusible substances, and are capable of resisting exposure to very high temperatures without softening. It is on account of its extreme infusibility that lime is found to be the most suitable material for the cylinders upon which the oxyhydrogen flame is made to impinge to produce a brilliant light, the intensity of the light being due to the extremely high temperature to which the lime is raised. Lime, however, from its want of cohesion, could never be brought into general use for such purposes as fireclay is employed, and this is also the case as regards silica, which requires the addition of some substance of a basic character with which it will unite, and so cause the particles to bind together. The nearest approach to the use of silica alone as a firebrick is in the well-known Welsh brick, made from the Dinas rock in the Vale of Neath. This material, before it was made into firebricks, had long been used for repairing the furnaces at the copper works of South Wales, for which purpose its peculiar property of expanding when subjected to the influence of high temperature, instead of contracting (as is the case with ordinary fireclay), renders it particularly suitable, the cementation of the bricks being facilitated by the increase of temperature. In order to make bricks of this Dinas rock (which occurs in various conditions, from that of a firm rock to that of disintegrated sand), it is necessary to mix with it about 1 per cent. of lime. These Dinas bricks will stand very high temperatures, but they are more friable than ordinary firebricks, and will not resist to the same extent the action of basic substances, such as furnace slags containing much oxide of iron. The bricks are porous, readily absorbing moisture; hence it is necessary that furnaces built of these bricks should be gradually heated, the bricks being liable to crack if sufficient time is not allowed for driving off the moisture. The composition of the clay used for firebricks is a question of considerable importance, inasmuch as the quality depends greatly upon its chemical constituents, although its power of resisting fusion when exposed to intense heat is affected by its mechanical condition. The same materials, when mixed together in the form of a coarse powder, will require a higher temperature to fuse them than would be the case if they were reduced to a fine state of division. For the manufacture of firebricks raw clay is ground between rollers or under edge stones, or reduced to powder by means of a Carr's disintegrator, which consists of large cylinders constructed of wrought-iron bars revolving rapidly in opposite directions. The clay is then kneaded with water, old bricks or other fired ware reduced to a coarse powder, technically known as "grog," being mixed with the raw clay. This admixture of previously burnt clay renders the bricks less liable to shrink, and enables them to bear a much higher temperature without fusion than would be the case if only new clay were employed. The qualities required in firebricks are:—1. That they should bear exposure to intense heat for a long period without fusion. 2. That they should be capable of being subjected to sudden changes of temperature without injury. 3. That they should be able to resist the action of melted copper slags. It is not to be expected that any one description of brick should exhibit all these qualities to the fullest extent, and it is therefore essential that, in selecting the kind of firebrick to be used, due regard should be paid to the particular purpose for which it is required. A firebrick like the Dinas, containing 98 per cent. of silica, will bear exposure to a higher temperature than a Stourbridge, but it will run down sooner than the Stourbridge when in contact with the melted iron slag. Gannister is the name given to a fine grit, which occurs under certain coal beds in Yorkshire, Derbyshire, and South Wales, which is especially adapted for lining cupola furnaces; the peculiar black gannister from the neighbourhood of Sheffield is in great request for this purpose, as, owing to the large quantity of silica it contains (from 80 to 90 per cent), it will stand high temperatures without shrinking. The Lee Moor bricks are manufactured at Plympton, in Devonshire, from the coarser portions of decomposed granite, separated from the china clay during the process of washing. These bricks contain a large proportion of silica, and are very infusible, their power of supporting exposure to very high temperatures being increased by the coarseness of the particles of disintegrated granite, of which they are composed. Firebricks are also made of silicious clays from granitic deposits in other parts of Devonshire. The material employed for such bricks, as well as for the Dinas, differs materially in its character from what is ordinarily understood by the term fireclay, as used in the manufacture of such well-known bricks as the Stourbridge, Newcastle, or Glenboig; the quality of which, as regards their chemical composition, depends upon the relative proportions of silica and alumina, and their freedom from iron oxide and alkaline salts, the presence of which tends to render the clay more fusible.

ARCHITECTURAL ASSOCIATION EXCURSION, WILTS, 1887.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

WE left the party last week in our description of the excursion at South Wraxhall Manor, where some hours were spent in preparing practical studies of the work. We printed some historical notes of the place, and so may pass on to the parish church, nearly a mile distant. The tower, with its stone-built pack-saddle roof and large stair turret on the west side, is very French in character, the upper part being a later addition. The composition is decidedly picturesque, though the church itself has but little interest. Mr. C. Adye, borough surveyor of Bradford-on-Avon, restored the fabric a short time since. This architect also assisted in bringing to light the much-talked-of Saxon Chapel at Bradford, which is now fully repaired. This was next visited, and members examined Bradford church and bridges, and also Kingston House. The grouping of the ancient stone-built gabled houses of the town rising on the slopes of the valley of the Avon in picturesque confusion, is very pleasing; while the hideous town hall, designed by Fuller in 1855, does not look so bad in the distance when its detail becomes obscured. The township possesses a wonderful history, too long to recount here even in abstract, for want of space; suffice it to add, after all that has been said, architects will not find much to detain them in Bradford, which is somewhat disappointing. Kingston House, though a big building, is overwindowed as well as pretentious, and years ago was over-restored and internally altered. The excursionists next drove to Westwood, some two miles S.W. of Bradford, and visited the Manor House, now occupied as a farm, and the adjoining church, which has a noble western tower, somewhat elaborated, after Bath Abbey central pile in the matter of wall treatment. The most interesting part of the sacred building, however, is the charming chapel of Late Gothic work on the north side of the chancel. Inside there are remains of colour decoration in the niches of this chapel, and some old glass in the chancel window. A sculpture of Satan quaintly treated is labelled with the injunction, "Resist me and I will flee." The Manor House is picturesque with its circular stair turret, but furnishes a subject rather for a painter's pencil than an architect's study of building. Thursday's outing was somewhat upset by a break in one of the drags, necessitating the omission from the programme of Keevil, near Holt, where there are two half-timbered houses worth seeing. The first

halt was made at Great Chalfield Manor, of which we published a view, with plans and details, last Friday. The church and house are somewhat difficult to find, hidden as they are in a valley, away from the road some distance. Mr. J. A. Gotch described the buildings, of which the following are some particulars :—The manor house of Great Chalfield or Chaldefield, deriving its name from Roman times as the site of an ancient outpost, connected with the *Fosseway* into Bath, forms, with its church and Elizabethan offices and stables, a very interesting group of buildings, rich in detail and thoroughly English in design, dating from the latter days of Henry VI., and built by Thomas Tropenell, who died in 1490. Large fish ponds once existed at the rear of the house, and were supplied by natural springs; the principal pond was 538ft. long by 51ft. broad, the two others were each 83ft. long by 31ft. wide. The plans of the house, which we gave from Walker's "Examples of Gothic Architecture," clearly explain its original arrangements. The banqueting hall measured 40ft. by 20ft., and it was 20ft. high. The porch is richly groined, and has a peep hole into the refectory or dining-room. The oak screens in the big hall correspond, we are told, somewhat in detail with that at Haddon Hall. Beyond the hall leads the staircase, still existing, and so the buttery, called the dining-room (on plan), is entered; from here the rooms known as "the Priest's dwelling" were reached. At the east end of the hall two elegantly-groined bays, with heraldic bosses and carvings, are carried out to the north and south of the apartment in similar proportions to the entrance porch. The northern bay, to the left on entering the hall, leads to a massively-vaulted room, lighted by narrow windows; but now demolished, save the front wall, which stands as shown on the plan. The original domestic offices with which these rooms communicated have been pulled down. The hall had a rich ceiling, from which some large plaster bosses were stored in the crypt of the Palace at Wells, and the walls had several loop or peep holes, with quaint masks in front of the openings, communicating with apartments adjoining. The old music gallery over the screen has gone, and the interior has been entirely refitted for modern convenience, the hall being cut up into rooms in reckless ignorance and wanton destruction. The chief interest of the house as it stands is comprised really in the north and south fronts, with their many gables and two beautiful oriels. These are particularly good examples, and the carved figures forming the finials over the gables are especially good and massively carved. We gave drawings of some of them with our view of the house showing the front façade. The church, like the house to which it belongs, has been spoiled to a great extent by alterations, but still it is very interesting with a picturesque bell turret over the western gable, a hooded west doorway or porch, and a traceried window of Henry VII.'s time. The original chapel existed here as early as 1308. The builder of the manor house erected a richly-treated stone screen to divide the south chapel from the nave (which is only 13ft. wide and some 25ft. long), but this now stands in front of the chancel, and has been cut down rather and scraped considerably. Mr. J. D. Sedding described the churches of Steeple Ashton, Edington, and Westbury, which were visited in this order. Steeple Ashton (properly Staple Ashton) Church is a large, lofty, and imposing building internally, with a high clerestory and wooden groined nave, the aisles being vaulted in stone, having rich corbels massively carved with figure sculpture supporting the ribs of the groining. These aisles were built by two wealthy clothiers named Long and Lucas, and their work is of a singularly bold and massive kind. Externally the church is unquestionably important looking, but its detail is excessively coarse, and the composition bristles again with pinnacles and buttresses, while, to give an idea of the scale adopted, the battlement cornice is 3ft. deep. The chancel was built entirely from the plans of Mr. H. Clutton about 20 years ago. The south porch is groined, and has a parvis over it, and a huge sundial painted outside. The western tower commands the country round, and attracts the inquirer after ecclesiology, who will, on visiting Steeple Ashton, be chiefly rewarded by a study of the planning of this church, which is no doubt its main feature. The village has a quaint market column, and stone-built lock-up with a high roof situated in the main street on a green. Of Edington Church, illustrated the week before last, little need here be said, seeing that we then printed Canon Jackson's comprehensive paper on its history and leading points of design. Mr. Ponting met the party and exhibited his clever drawings, showing the church, and the work which he has in progress for finishing the restoration now in hand. Considerable discussion ensued between Mr. Sedding, who delivered a lecture on the church, and the architect in charge of the fabric, because the former took exception, amongst other details, to Mr. Parker's opinion respecting Bishop William of Edington's work in this church, Mr. Ponting taking the side of Canon Jackson and Mr. Parker. The lecturer likewise remarked upon other points concerning the dates and character of the windows and roofs; but on the architect for the restoration explaining by direct reference to the features themselves, the lecturer admitted his remarks were based upon a hasty visit to the church some few days previously. Mr. Ponting seems to be executing the work of restoration both carefully and thoroughly without needless repair. Passing the great White Horse on Westbury Down, where the party was photographed by Mr. J. L. Robinson, A.R.H.A., the excursionists reached Westbury Church, which is a large Perpendicularised Norman building, with a central tower of plain design rising boldly from the midst of great chestnut trees well dominating the town. Internally the edifice is spacious, but it lacks interest as compared with the beautiful design at Edington, and the fabric has been restored out of all knowledge of what it once was. There is a good modern window in the Willoughby de Broke Chapel south of the chancel; but the other stained glass in the church is exceedingly poor. In the south transept is a "Corinthian" monument of free design and refined detail, with effigies of Sir James Ley, Earl of Marlborough, and his wife—

"That good Earl, once President
Of England's Council and her Treasury"—

which is worthy of a pencil note. The new vicarage in red brick and tile adjoining the churchyard seems a comfortable and well-planned house. This visit finished Thursday's proceedings.

The conclusion of the programme on Friday was to some extent marred by a heavy storm and intermediate showers during the day. The first halt, after a ride over the Lansdown Hills, commanding an extensive panorama extending into Wales over Gloucestershire, Wilts, and Somerset, was made at Hamswell Manor, celebrated as the residence of Dick Whittington, the memorable Lord Mayor. The house scarcely retains any features of architectural interest, save a projecting entrance bay of unusual plan and a roomy, comfortable hall. The gardens and terraces are notable, however, and cleverly arranged. Marshfield is a characteristic Gloucestershire village with a long rambling main street, commencing with a range of quaint almshouses, having a stone-built spire and clock turret in the centre of their front, and terminating with the parish church. The latter building is only of ordinary interest, with a bold western tower, now in course of restoration. Several houses in the street are decidedly typical, while in a way the place, by reason of its unaltered, old-world aspect, reminds us of Burford in Oxfordshire, one of the most delightful ancient villages in the country. In the rear garden of St. Catherine's hostelry there is a summer-house, entered by a refined doorway worthy of a note. Cold Aston was seen next, and here a lengthened stay was made at the handsome Court-house now occupied as a farm. Inside there are some extremely good ceilings in plaster-work, and the old hall screen still divides the entrance and the kitchen. The front entrance and also the first-floor doorways are original, including their elaborately-framed and many-panelled doors. The dignity of the exterior front façade is enhanced by a handsome gateway, reached by a flight of circular stone steps leading to others within its spacious portals. The central part of the elevation is surmounted by a stone balustraded balcony overlooking the beautiful valley on the south. The church of Cold Aston deserves a visit, on account of the richly-canopied pulpit, which is recessed in the north wall of the nave, having an entrance-doorway by the side of it, which likewise originally led to the rood loft, the stone staircase still remaining perfect, though the loft has gone. The pulpit itself is of wood, elegantly traceried and carved, the canopy and other parts being of stone. Some drawings of this pulpit are given in Dollman's "Ancient Pulpits" (Plate 17). A long and very hilly walk through a by-road brought the excursionists to St. Catherine's Church and Manor, placed on the side of one of the most romantic and picturesque glens in Somersetshire, on the declivity of Holt Down. Here it was that Prior Cantlow in 1499 built the Grange, which in a modified form still stands, with its delightful terraced gardens and holy well of the saint from whom the estates obtained their name. The house contains a good collection of old English furniture, and also a rich selection of works of art. Its hall is divided by the ancient Jacobean screen, and the original fireplaces are *in situ*. Everything about the house reminds one of George Eliot's graphic descriptions of an ideal home; while its architecture, without aiming at specialities of elaboration or detail, is eminently suitable and interesting. The church has been restored with loving care and good taste. It contains a fine wooden pulpit, which is original. The chancel east window contains some particularly good old glass representing figure subjects, cleverly repaired by Messrs. Powell, of Whitefriars, who also are responsible for the mosaic and mural tile work at both ends of the nave as well as the chancel. The tiles are most satisfactory, both in colour and design, the surface being finished in an overglaze, which gives great variety and beauty of tone, without loudness or loss of harmony. St. Catherine's, though the last place visited on this excursion, will be remembered with by no means the least interest. Our illustrations to-day show Hinton Abbey, from measured drawings by Mr. Wallace Gill, of Bath. This building was mentioned in our report of the excursion last week. The characteristic view of St. John's Church, Devizes, which we print in this same connection, is one of the late Fred. C. Deshon's pen-and-ink studies, lent us by Mr. J. G. Gaudy. Some of the party on Saturday visited Devizes, which originally was intended to have been included in the week's programme. St. John's Church, situated near the Castle, is one of the most interesting in the county. The original cruciform Norman church was enlarged in 1450, the N. and S. chapels being added at a still later date. The massive central tower rests, like that of St. Bartholomew, Smithfield, on two semi-circular and two pointed arches, the transepts being narrower than the nave. Major Davis, the city architect, conducted those members of the excursion party who remained in Bath on Saturday over the Abbey buildings there, the Roman Baths, which he has assisted in bringing to light, the Circus, and Royal Crescent, showing also the other features of interest in the town.

PICCADILLY CIRCUS.

As we lately remarked, the alterations at Piccadilly-circus have not exhibited any architectural design in the arrangement of the lines of frontage of the surrounding buildings. At present the open space, though bare and unadorned, is a boon, as open spaces always are in crowded cities; but the triangular plots of vacant ground at present idle and wasted are anything but happily disposed. The Metropolitan Board of Works evidently do not know what to do with them. Attention has been drawn to the subject again by a letter in the *Times* by Mr. William Woodward, in which the writer directs attention to the schemes that have been in contemplation for dealing with the site in question. One of these plans, as our readers know, was to construct underground conveniences—a very useful way of turning the site into account; another suggested the erection of a statue, a third that of a fountain, both agreeable modes of adorning the vacant space. Lately the Metropolitan Board of Works have had under consideration another plan, that of building on the open spaces, and plans and models of these schemes have been prepared and discussed. These we have had an opportunity

of inspecting. Mr. Woodward is perfectly justified in thinking that the last proposal of the Board will be condemned by all who desire to preserve intact the reclaimed open area. Nothing surely can be more absurd than to obtain such an open space and then to sacrifice it for a building site, thereby cutting off the unbroken view of the buildings that surround the Circus. The space contains two triangular plots, forming as it were, the entrance to Shaftesbury-avenue on the north side. Upon these it has been proposed to build blocks of offices above arches which will give access to the space of ground. Models have been prepared in cardboard representing the effect. Each triangular block is of two stories above the arcaded story, and has canted corners. Another model is a more extensive scheme: the two triangular plots and the intervening entrance are proposed to be covered by one large structure or block of shops and offices. In plan, this building would form an irregular elongated hexagon. Towards the Circus there would be a circular or concave side, forming the entrance from the Circus to Shaftesbury-avenue, and on each side straight receding fronts facing the Quadrant and the Criterion respectively. On the north, the building has a straight front towards Glasshouse-street and the London Pavilion. Transversely from Piccadilly-circus, and in a line with Shaftesbury-avenue, the block is pierced by two arcades, scarcely "triumphal arches or tunnels," as Mr. Woodward has called them, the two archways being separated by piers and arches in the direction of the avenue, probably intended for the two lines of traffic in opposite directions. These archways are about 25ft. each. As Mr. Woodward remarks, the arched entrance would be askew to every thoroughfare, and would only accommodate one line of route, Shaftesbury-avenue. The Quadrant on the west, and Coventry-street and Haymarket on the east, it would not help in the least, and were such a building erected, the breathing space where seven thoroughfares discharge themselves, as the same writer says, would be gone for ever. But we may further regard the effect of so huge a block of building at this juncture. The only thing it would do would be to complete the circus, and bring it back to its original circular shape; but the high, steep roof, which is shown in the model, would harmonise with no other line in the neighbourhood. At the time the old buildings on the east side of the Circus were pulled down, we remarked upon the inadvisability of destroying one quadrant of the Circus and throwing open an awkward-shaped area of ground. This view of the case is no longer tenable; the block has been demolished, and the area thrown open to light and air, and any rebuilding will be virtually returning to the old plan. We hope the Board will reconsider the earlier scheme of inclosing the area by a balustrade, turfing and planting it, a model for which was made some time ago. This model, which represents the Circus laid out with a quadrangular-shaped inclosure, with entrances at the sides and a column or fountain in the centre, is far more feasible and desirable a means of utilising the area and of overcoming a difficulty which has given rise to much uncertainty and hesitation. Trees, and fountains, and statuary are the only agreeable modes of dealing with our great urban inclosures, as they least rob us of air and sunlight, and give us something green to look at in this wilderness of bricks and mortar.

NOTES FROM EDINBURGH.

THE Royal Scottish Academy has for the second time opened its galleries for an autumnal exhibition, and which will prove, doubtless, an attraction to the many visitors who come to Edinburgh at this season. The collection is composed principally of water-colours, but room is made for some sculpture pieces, and for works in white and black. There are no architectural exhibits, properly so-called, although architectural subjects, forming the groundwork of pictorial effects, make up a large percentage of the drawings, in this respect making a conspicuous contrast to the works in oil exhibited in the spring.

The sculpture exhibits are distributed through the galleries, and look better and more attractive than when ranged together in regimental order in the south room. There are 852 exhibits altogether, filling four apartments, and all are within range for easy and accurate inspection. The collection is an interesting one, apart altogether from the circumstance that it contains no water-colours of any very high exceptional merit. In this respect it does not differ much from its predecessor of the spring, but it forms a fair representative of the present state of water-colour art, and of its characteristic excellences in purity and brilliancy of colour, sharpness of outline and details. There are no very large exhibits; the bulk of the collection is made up of delineations of homely studies, ranging from notes or sketches of pictorial effects to the most highly-finished water-colour. Many, but not all, of the artists contributing to the earlier exhibtion have samples of their works in the more humble vehicle, which adds interest by the comparison to the collection. Studies or first sketches of well-known pictures are to be found, and in addition to the interest attaching to the works of living artists, a small loan collection has been added, containing some studies by Turner, Williams, De Wint, Cox, Prout, &c., and some very characteristic specimens of the late Sam Bough, R.S.A., and others.

Among the larger pictures the most noticeable are two portraitures of children by Otto Leyde, R.S.A. In 173, "A Day at the Seaside," and 379, "Through the Harvest Fields," he has depicted some youthful rovers with doubtless due fidelity, and all that could be desired in the way of life-like attitude and expression to mark the sprightly vigour of life's gay morn. The same brilliancy of colour and beauty of expression is characteristic of his other and smaller contributions, and they are all, if not preferable, at least fully equal to anything he has produced in oils. Another larger work arrests the eye, also a figure subject, by J. Denman Adam, entitled, "In Wonderland," A lady, lying at ease under shade of a large Japanese parasol, is so absorbed in the wonders of her novel as to be unconscious of the close proximity of some calves, attracted by the colours of the parasol. The picture is a brilliant piece of colouring, with sunshine all around on the grassy lawn, and a church tower of homely architectural pretensions in the distance. The landscape and the lady, however, are both inferior in finish of details to the portraiture of the animals, which are excellent specimens of the artist's skill. There are also two portraits of youthful heads by W. E. Lockhart, R.S.A.; but they do not bear the stamp of the same excellence as the artist's work in oils, and, though brilliant in colour, they lack the finer shadows of a finished portrait.

Gourlay Steele has a large collection, of which the most noticeable is the finished sketch of his well-known picture, "Ever Faithful, Ever Sure"—the collie watching in faithful attendance on its sick or dying master, with a lively terrier amusing itself on the floor. 389, "The Pick of the Flock," is a finished picture of two rams' heads, painted with the most scrupulous attention to details. They give less advantage for judging of the pick of the flock, being only heads; but they make a very pretty picture.

Clark Stanton, R.S.A., has also a large contribution—figure subjects, mostly fanciful. They are all interesting in colour and draughtsmanship and drapery of the figure. The largest (136) is entitled, "Dropping Her a Line." The lady, represented in the act of receiving a letter, which has been mysteriously dropped over a high wall, is somewhat stiff, and apparently afraid of accidental injury to the missive as it came into her hand. R. McGregor has a number of small studies of larger pictures in oil, full of expression and details. 446, "Pastime," by J. D. Michie, may be taken as a sample of perfect draughtsmanship, colour, and perspective. In the foreground are the children, with a youth exhibiting a splendid soap bubble, whilst the mother, with her cares, is seen soberly walking in the distance.

There are two strikingly peculiar pictures by Arthur Melville which arrest the eye, in virtue of the contrast they present to the generally gay aspect of their neighbours, and the somewhat original method of manipulation. 144, "Funeral Service in an Arcadian Cottage," is an extreme type of Rembrandtesque. The funeral service has brought together a large company, who are engaged in prayer. The cottage interior, in primitive style, is lighted only by the opening in the roof for escape of the smoke from the fire burning dimly on the hearth below. The fire is parted from the company by a broad, high, massive stone. In the foreground, close to the fire, is placed the patriarch of the family—ancient and paralytic. The force and power of the painting consist in the great amount of expression given to the countenance of the officiating clergyman, the grandfather, and others on whom the light is made to fall. The only unpleasant feature is the bald head of one of the company, which is bowed down on the stone, and presents the aspect of a globular mass too forcibly. 642, "Ghosts of the Past," is a picture of the standing stones of Stennis, a Druidic circle, in twilight or some stormy darkness. The light is like that of an eclipse, and is powerfully suggestive of the mystery surrounding these monuments of the past. The workmanship seems to be effected by blots of colour skilfully disposed.

Passing on to landscapes, we find Mr. Beattie Brown, R.S.A., in great force with water-colours, not inferior in any respect but in their size to his works in oil. They have the same characteristics of vigorous and truthful colour, and many pleasing varieties of light and shadow with careful and elaborate detail in the foreground. J. Smart, R.S.A., has also a large number depicting the beauties of Scottish river, glen, and mountain. Walter Paton, R.S.A., sends eleven pictures, all representative of sunshine, or the repose of a calm evening light. They much resemble the works in oil, familiar to the public, and are all remarkable for their delicate manipulation of details.

As might be expected, the picturesque aspects of architecture form the subject of many of the pictures; indeed, of a very large proportion. 303, "The House of Castor and Pollux, Pompeii," by W. E. Lockhart, shows the atrium and its pillars, with the red dado decoration on the walls, disclosing one of the pillars, to be built of brick encased with the cement or plaster work, which receives the colour. Pollok Nisbet sends three views in Tangier. C. M. Hardie has a view in the Alhambra, with corridor passage and small basin fountain. The arcading is excellently rendered, but has none of the florid decoration associated with the building. T. Scott, along with other foreign subjects, sends a view of the ruins at Rome, with the arch of Titus.

There are many sketches of Old Edinburgh; several also of the interior of St. Giles. The artists cannot be complimented on their rendering of this interior, and the sketch of the Thanksgiving Ceremony of the Jubilee service (306) is dark and dismal. By far the best subject of this sort is "The Grave of Livingstone," by James Cafe. It is really a view of the interior of Westminster Abbey, and stands alone in the excellence of its draughtsmanship and the play of light and shade throughout the picture, the apparent accuracy of every line and the natural aspect of the whole. It gives a most impressive idea of the old architecture and its lofty and graceful composition, although but a small portion is delineated. John D. Michie has a pretty sketch of Jedburgh Abbey, very truthful in its colour, although great liberties are taken with the accessories. John Lennie's "Prentice Pillar, Rosslyn Chapel," is a beautiful piece of careful drawing, with all details, and they are not few, very clearly shown, and without any attempt to vulgarise the interior as a picture by representing it in all the colours of the rainbow.

The North Room contains three large water-colour drawings by the late T. Hamilton, R.S.A.—the one 716, "Front Elevation of the High School, Edinburgh," of which he was the architect, and a perspective of the same; and 780, his design for the Royal Scottish Academy and the National Gallery buildings, which was rejected as far too expensive, with its peristyles. The absence of the columnar decoration at the sides of the existing building by Playfair is its great defect.

Not the least interesting part of the collection, thus briefly noticed, is found in the South Octagon — a small monochrome by Turner, about 4in. by 5in., of Berwick-upon-Tweed, and another of the coast above Shore-

ham. They are samples of the great accuracy of draughtmanship and skill in selection of the points necessary to bring out a definite representation of the most important characteristics of the subject. 439, "Crombie's Court, Edinburgh," by the late James Drummond, R.S.A., is a wonderful example of his draughtsmanship and colouring. The old wooden stairs and picturesque confusion of the narrow close are given with the most minute attention to details. 462, "A Highland Stream," is a piece of high art, soft and pleasant in its colour, by the late W. S. Leitch.

Three views of Grecian temples, by the late H. Williams, are hung in this room—all marked by great accuracy of drawing and purity of tone. The view of the Parthenon is taken from a point of view which gives only an impression of the magnitude of the columns, and but a poor idea of the building as a whole. Two fine windmills by De Wint, a view in Wales by David Cox, and an old building in Chester by Prout are interesting samples of the artists' works. There are also several pictures by the late Sam Bough, almost all exhibiting the greys and neutral greens and rather dirty skies which he loved to paint.

Interesting studies for larger pictures by Sir Noel Paton are in this room and the North Room, and many aquafortis etchings by Hole and others give pleasant variety to the collection, which is receiving a fair measure of patronage.

THREATENED LONDON CHURCHES OF THE RENAISSANCE PERIOD.

IN a letter to the daily press, Mr. T. G. Jackson, F.S.A., expresses his satisfaction that public attention is awakening to the architectural value of churches erected during the English Renaissance. Only a few years ago, Gothic fanatics might, he points out, have carried away, not only the steps of St. Martin's-in-the-Fields, but the church itself without much opposition; but no sooner are our fears for the maintenance of the dignity of Gibbs' façade removed than another church by the same architect is threatened with destruction. "It is now," Mr. Jackson remarks, "the graceful church of St. Mary-le-Strand which is in danger, a building which for the actual beauty of its architecture and the unrivalled advantages of its position has scarcely an equal in Europe. Were the Strand in Rome instead of in London, the glorious series of its three steeples, and the front of Somerset House, with its portal, which is not unworthy of comparison with that of the Farnese Palace, would have been the theme of every idle tourist, and have made the street famous throughout the world." He continues: "One English church, indeed, of this class has won European fame, and St. Stephen's, Walbrook, is known and quoted as an authority in Rome. A few months ago this exquisite little church, Wren's acknowledged masterpiece, was perfect as it came from his hand. It retained its original dark oak pewing carved with emblems of civic companies, its Communion table, rails and reredos, its lofty pulpit overshadowed with a sumptuous sounding-board, its exquisitely carved font-cover, and the west end was filled by an imposing loft and organ case of the same rich dark oak as the rest, splendid with gilt pipes, cherub musicians, scrolls and wreaths, and all the picturesque adornments proper to such structures. How much of this now remains I do not know; but the organ case and loft are gone; the pews are cut down to suit the fashion of the day; the bases of the columns, which were stilted to the original level of the pews, now stand exposed and naked—much, apparently, to the surprise of the building committee, who do not know what to do with them, and who will probably next find out that the pulpit is too high, and will cut it down to their own standard; and thus an invaluable example of a noble style and a great master has been wantonly sacrificed to the genius of parochial incompetence." While it is now too late to save St. Stephen's, Walbrook, public discussion which has protected St. Martin's will, he trusts, also preserve St. Mary-le-Strand.

Mr. W. Butterfield declares that the panic as to the assumed unsound condition of St. Mary-le-Strand is needless and unworthy. He refers to the similar outcry made nine years ago, when careful examination showed that only a few repairs were required, and suggests that, instead of raising the extraordinary erections which now disfigure the church, it would have been better to have instructed a good mason to put up a useful scaffolding to the cornice for its examination and repair.

Mr. Henry Poole, mason to Westminster Abbey, writes:—"In 1878 the parapets and vases of St. Mary-le-Strand Church having been declared to be dangerous by the report of a surveyor, Mr. Butterfield requested me to examine them for the satisfaction of the late rector, whose leave had been asked for their removal. Before my report, which was strongly in favour of their stability, was sent in to the rector, Mr. Butterfield met me on the church roof, and went through my report with me carefully on the spot. The question of the cornice was not then raised by anyone. There was no excuse for speaking of the vases and parapets as otherwise than perfectly secure—as secure against falling, under fair treatment, as they ever had been. I examined them as a mason, with the help of my son. I have dealt with masonry, and nothing else, all my life. I never called myself a 'builder,' which is a term which may or may not include a real knowledge of masonry. I am nearly ten years older than I was in 1878, and I have retired from active work; but I feel so surprised at what is now taking place at St. Mary's that I trust you will allow me to speak to what I know. I do not impute motives to anyone; I can only feel sorry for the kind of treatment which I see that this church is now receiving. After the repairs which this work received from me in 1878 I do not understand how it can be necessary. If these vases are to disappear, as the four vases did some years since, from the angles of the tower, the work becomes one of mutilation. A piece of cornice has now fallen, and the removal which is going on of other vases seems to me to imply a great want of judgment on the part of somebody. The cornice could be examined and repaired without interference with the vases or parapets. It is much easier to kill than to cure. I think the course which is being taken shows panic rather than knowledge of business. Mr. Butterfield took no part after the sending in of our report to the late rector. From that time we were overlooked by the local surveyor. In consequence of my report in 1878, certified to by Mr. Butterfield, the late rector refused to give his permission for the removal of the parts then proposed."

We may remind readers that illustrations of the west front and circular church of St. Mary-le-Strand, from measured drawings by Mr. Thomas E. Pryce, were given in the BUILDING NEWS for June 16, 1876; and several sheets of measured details from St. Stephen's, Walbrook, by Mr. H. D. Walton, in our issues for Jan. 2, 1885, and April 23, 1886.

ROMAN NECROPOLIS AT CARMONA, NEAR SEVILLE.

MR. GEORGE BONSOR gives some interesting particulars of the excavations made by Don Juan Fernandez and himself on the site of the Roman necropolis at Carmona, near Seville. The Roman tombs were found to have been made on the site of tumuli of the Prehistoric era. Round these mounds the Romans had for centuries hewn small chambers out of the rock to serve as family tombs. These are from four to five yards square and the height of a man. In the walls are small cavities or niches for the cinerary urns, each of which last generally contains, besides the ashes of the dead, a coin, a mirror, a lachrymary, needles, a stylus and tabula, and a signet ring. The walls are mostly painted in fresco or distemper in the Pompeian style with representations of birds, dolphins, and wreaths of flowers. Near the entrance of each tomb is the crematorium, a curious oven, also hewn out of the rock, on the sides of all of which signs of fire are still visible. So far, about 320 tombs have been discovered. Contrary to what was previously believed, Mr. Bonsor finds that the funeral pyre in Spain was not square, but oblong, the body, with its bier, being laid on it, as was proved by the presence of the nails and iron fittings in the ashes. Among the more important discoveries are those of a columbarium and three large triclinia for the funeral banquets, with the peculiarity that in each a deep channel is cut all round the mensa into which the guests threw the libations. The largest funeral triclinium discovered contains three tables, with their couches round. In addition to these there is an altar, a tomb with its cinerary urns, a kitchen, a bath, a well, and a sanctuary, in which is a stone statue. Fifty yards from this triclinium is a Roman amphitheatre also hewn out of the rock. During the course of the excavations over 3,000 objects of interest were found, including many inscriptions, fragments of statues, glass, marble, and earthenware urns, lamps and mirrors, rings and coins, and other valuable articles, all of which have been placed in a museum in the town. The excavations are still being continued.

SIZE OF BRICK PIERS.

DATA and rules as to the strength of brick piers are very scanty, though tables of the crushing strength of bricks abound. The United States Government have laid down certain rules which may be worth mentioning. Brickwork laid in cement mortar, which is always used in Government works, is calculated to sustain nine tons to the square foot, which weight is assumed to be safe up to 10 or 12ft. high. Thus a pier of only 12in. square should not be more than that in height. Brick piers, like iron and wood pillars, are liable to break by bending as well as crushing over a certain height. A table calculated upon this basis has been published, from which we gather the following proportions. A pier the smallest diameter of which is contained three times in its height can safely bear per square foot in tons 9·5, with a factor of 5. When the diameter is 6 times, the safe weight is 8·; when 9 times, it is 6·3; when 12 times, the weight is 4·8; 14 times, it is 3·5; 18 times, the safe weight is 2·1; 20 times, 1·7; 25 times, 1·1; and 30 times, ·8. The above calculation of 9 tons per square foot appears rather high. One author gives the crushing strength per square inch as 5201b. per square inch, which amounts to about 5½ tons per square foot safe load—a figure which is nearer the mark for brickwork such as we ordinarily meet with in piers. Dr. Bindon Stoney observes: "The working load on rubble masonry, brickwork, or concrete rarely exceeds one-sixth of the crushing weight, and this seems a safe practical limit." A pier is generally sufficiently massive not to yield by bending. It is very easy, however, on a lofty building of several stories, with small piers between the windows, to exceed the limit of safety, or five and a half tons per foot square. In many warehouses of several stories, where the openings are large and the piers very small, architects ought to be careful to give increased depth where width cannot be obtained, or they may be on the safe side by using stanchions of cast-iron between the openings, with skewbacks for the abutment of the arches. Every brick wall with windows ought to be regarded as a series of piers whenever the apertures exceed the width of the piers, and the walling above the piers is heavy, and has to carry iron girders, in addition to the weight of dead brickwork. The strength of bond cannot be reckoned upon when the horizontal walling is not of any great depth.

OVERFLOWS.

HOW entirely inadequate the ordinary provisions for carrying off rainfalls in our roadways are for such an emergency as that of the recent storm can be only judged by the appearance of the roads in South London during the deluge of rain which threatened the inhabitants of that part of London. The sudden and visible rising of the flood within the few minutes the storm was at its fury was baffling to all who witnessed it. Traffic and tramway cars were stopped before their journeys were completed, the pathways rapidly disappeared as the road became a wide river, flowing into adjacent house basements, and destroying much property. The main thoroughfares at Brixton became a torrent of water, which threatened to swamp all the basements, several of which were inundated. We may particularly point out the fact that the side entrance flaps along the thoroughfares were burst open by the over-gorged sewers, and poured out volumes of dirty water, rendering the

THE ANCIENT HOUSE, IPSWICH.

pathways impassable. Two things are obvious. The sewers were quickly filled and began to overflow through the house-drains and gratings in the roadway, and the existing gratings, even where they could be of use, are too small to allow the water to escape quickly enough. Storm overflows are the only means of obviating the mischief and danger of storms of this kind; the few provided are inadequate to any emergency. Although several have been completed at great cost at Deptford and Wandsworth, and other parts, they only relieve their immediate districts. Others are called for at intervals to relieve low-lying localities of surplus water that may accumulate in the sewers and thereby prevent what occurred in several parts the other day—an inundation of basements by backflow.

SHEET-METAL DECORATIONS.

SHEET metal is largely employed in America for architectural decoration. We find it used for cornices, crestings, statuary, terminals, and other details. The manufacture has become a large and profitable one in the States, and employs a number of designers and modellers. The effect upon architecture is more or less disastrous; the architect is reduced to a builder of carcases, upon which the sheet-metal worker can arrange his details according to certain patterns specified. Cheap ornamentation is the great inducement of those who build (*sic*) in this manner. Luxuriant cornices, balustrades, and roofs are the necessary result. Zinc is extensively used for roofing and ornamentation on account of its cheapness; but brass and copper are also employed. There is one advantage in metal-work—it is often more durable than stone and wood, and is less liable to get cracked and fall about. The crestings and finials and the metal roofs protect the building from lightning. Looking over some recent designs, we find that considerable care is bestowed in the designing and modelling of detail: the statuary is modelled and securely fixed on a framework of iron; the cornices are supported on brackets in the same manner. A consideration in favour of the use of sheet metal is the reduction of weight — thus a statue of Justice, 8ft. high, one firm advertises as weighing only 130lb. Taking an ordinary façade to a building with cornice and trusses, balconettes, pediments over windows, and main cornice and balustrade, the saving of weight between stone and zinc would amount to many tons. The material is also impervious to the weather, and keeps clean. The sheet metal is largely used in the interior decoration of theatres, churches, and other public buildings.

THE ANCIENT HOUSE, IPSWICH.

SOME of your readers, perhaps, may be curious to see the house at Ipswich referred to by Mr. Owen. I send you—from my note-book—a sketch of part of it. The drawing shows only one of the three bays to the street front; the other two bays are substantially similar to the one shown. Those who may take the trouble to compare this sketch with the drawing of the post-offices at Knutsford, and of the New Zealand Chambers, illustrated in the BUILDING NEWS of Sept. 5, 1883, will be able to judge how far his "ardent admiration" of Mr. Norman Shaw has carried Mr. Owen.

HALSEY RICARDO.

CHIPS.

New board schools, erected for the Nottingham School Board in the suburb of Lenton, are approaching completion. Mr. Vickers is the contractor.

The Improvement Commissioners of Wellington, Salop, have adopted a scheme by Mr. Stooke, M.I.C.E., for improving the water supply, by enlarging the reservoir, and other works, at an estimated cost of £1,800.

In commemoration of his 50 years' service at Belton House, Grantham, Mr. G. A. Lowe, clerk of the works, has been the recipient of a present from the Belton workmen employed by Earl Brownlow, under Mr. Lowe. The testimonial took the form of a table epergne with four frill tubes of tinted glass and plate foundation, two vases to match, and also a silver pencil case.

A third well is being sunk for the Barnet District Water Company, which it is expected will raise the total supply per diem to the district to two million gallons. Messrs. Docwra are the contractors, and the undertaking is expected to cost about £6,000.

ILLUSTRATIONS.

THE CATHEDRAL, CHIHUAHUA, MEXICO.—SELECTIONS FROM THE ROYAL ACADEMY, THE GROSVENOR GALLERY, AND THE ROYAL INSTITUTE OF PAINTERS IN WATER COLOURS.—NEW SCHOOLS, NEWTON-LE-WILLOWS. — RIVERSIDE RESIDENCE, MAIDENHEAD.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

OUR LITHOGRAPHIC ILLUSTRATIONS.

THE CATHEDRAL, CHIHUAHUA, MEXICO.

Among the many notably large and interesting photographs of buildings collected together in the Art Galleries at the American Exhibition at Kensington, none is of more architectural importance than that of Chihuahua Cathedral, which we illustrate to-day by the kind permission of Messrs. Chain, Hardy, and Co., of 1,609 to 1,615, Arapahoe-street, Denver, Colorado, agents to Messrs. W. H. Jackson and Co., photographers. Chihuahua is the capital of the State of the same name, and has a population of about 16,000. The cathedral, or parochial church, is one of the most picturesque edifices in Mexico. It is built of cut stone of a light colour, and has two towers and a dome. It cost 800,000dol., about £160,000; it occupied 150 years in building, and was finished in 1741. The work throughout was designed and superintended by architects sent over from Spain. It is also stated in Chihuahua (with how much truth we do not know) that, in the absence of derricks and all hoisting machinery, as the church rose in height, it was buried in the earth, and the stones hauled up the inclined plane thus made to the top of the church. The top of the church is now reached by a dark and dismal winding solid stone staircase, situated in one of the main towers. One of the huge bells is pierced by a large cannon ball, but this does not impair its usefulness. The stone steps in the tower (about 8in. thick) are in many places worn nearly through by the feet of "climbing pilgrims." The cost of the church was sustained by a tax of one real (12½ cents, or about 6d.) in each mark of silver (8dols., or about £1 13s.) produced from the silver mines of Santa Eulalia, 15 miles distant.

SELECTIONS FROM THE SUMMER EXHIBITIONS OF THE ROYAL ACADEMY, GROSVENOR GALLERY, AND ROYAL INSTITUTE OF PAINTERS IN WATER COLOURS.

This sheet of illustrations includes some of the pictures which have deservedly attracted considerable notice during the summer season which is now drawing to a close. Sir James D. Linton, the President of the Royal Institute of Painters in Water Colours, is represented by his work of the year, "The Emperor Maximilian Visiting the Studio of Albert Dürer," the subject being the same as that which the painter selected for his tableau in 1885 at Prince's Hall. "Hesperia" is the title of Mr. Frank Dicksee's Royal Academy painting, rich in colour and style, delicate in execution, and graceful in idea. From the Grosvenor Gallery, we have selected Mr. Philip Burne Jones's "Shadow of the Saint," showing a street in a Mediæval city, with two passing maidens staying to notice the shadow, possibly, of St. Simon Stylites praying on his column. "Mist-Capped" is one of Mr. Charles Stuart's masterly studies of air-and-water effects amidst the wildness of nature. "Driving the Ducks" brings us home again to domestic quiet in a primitive village and tumble-down old fishing place situated some 10 miles north of Whitby, called Rumwick. The old cottage to the right of the sketch since the picture was made has been pulled down. The painter has fully realised in his drawing the spirit and detail of the scene. "Kettleness" is the title of Mr. W. Gilbert Foster's other picture, which graphically speaks for itself.

NEW SCHOOLS IN YORKSHIRE.

The school we illustrate this week is about to be commenced in Yorkshire. The architects are Messrs. Clark and Moscrop, of Darlington.

RIVERSIDE RESIDENCE, MAIDENHEAD.

This house is being erected on the Maidenhead Court Estate for Mr. C. Gervaise Boxall, of 22, Chancery-lane, W.C. The site, a beautiful one, about one-third of a mile above Boulter's Lock, and easily accessible from Maidenhead or Taplow, comprises over an acre of land and faces Cleveden Woods, the garden, with lawn tennis court, running down to the tow-path. Externally, the house is built of red bricks, hung tiles, and framed timbering in oak. The ground-floor, raised 3ft. above the general ground-level, has the following accommodation:—Drawing-room and dining-room, with large inner hall between, directly facing the river, the partition between the drawing-room and inner hall being a framed and panelled partition, and easily removable at will, thus enabling these two rooms to be thrown into one for dance or theatrical purposes. The ground floor also contains entrance-porch and vestibule with staircase hall, kitchens, and usual offices. The first floor contains six good bedrooms, dressing-room, and bath-room, with hot and cold water supply, the principal bedrooms opening by means of French casements on to a projecting balcony facing the river. From this balcony a most beautiful view is obtained up and down the river—the weir and backwater behind the island that carries the water to the mill below. Mr. J. H. Margetts, of Reading, is the builder, and is executing the work from the designs and under the superintendence of the architect, Mr. E. H. Bourchier, A.R.I.B.A., of 32, Great George-street, S.W., the quantities having been supplied by Mr. Alex. Pope, of 5, John-street, Adelphi.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

For description see p. 315.

CHIPS.

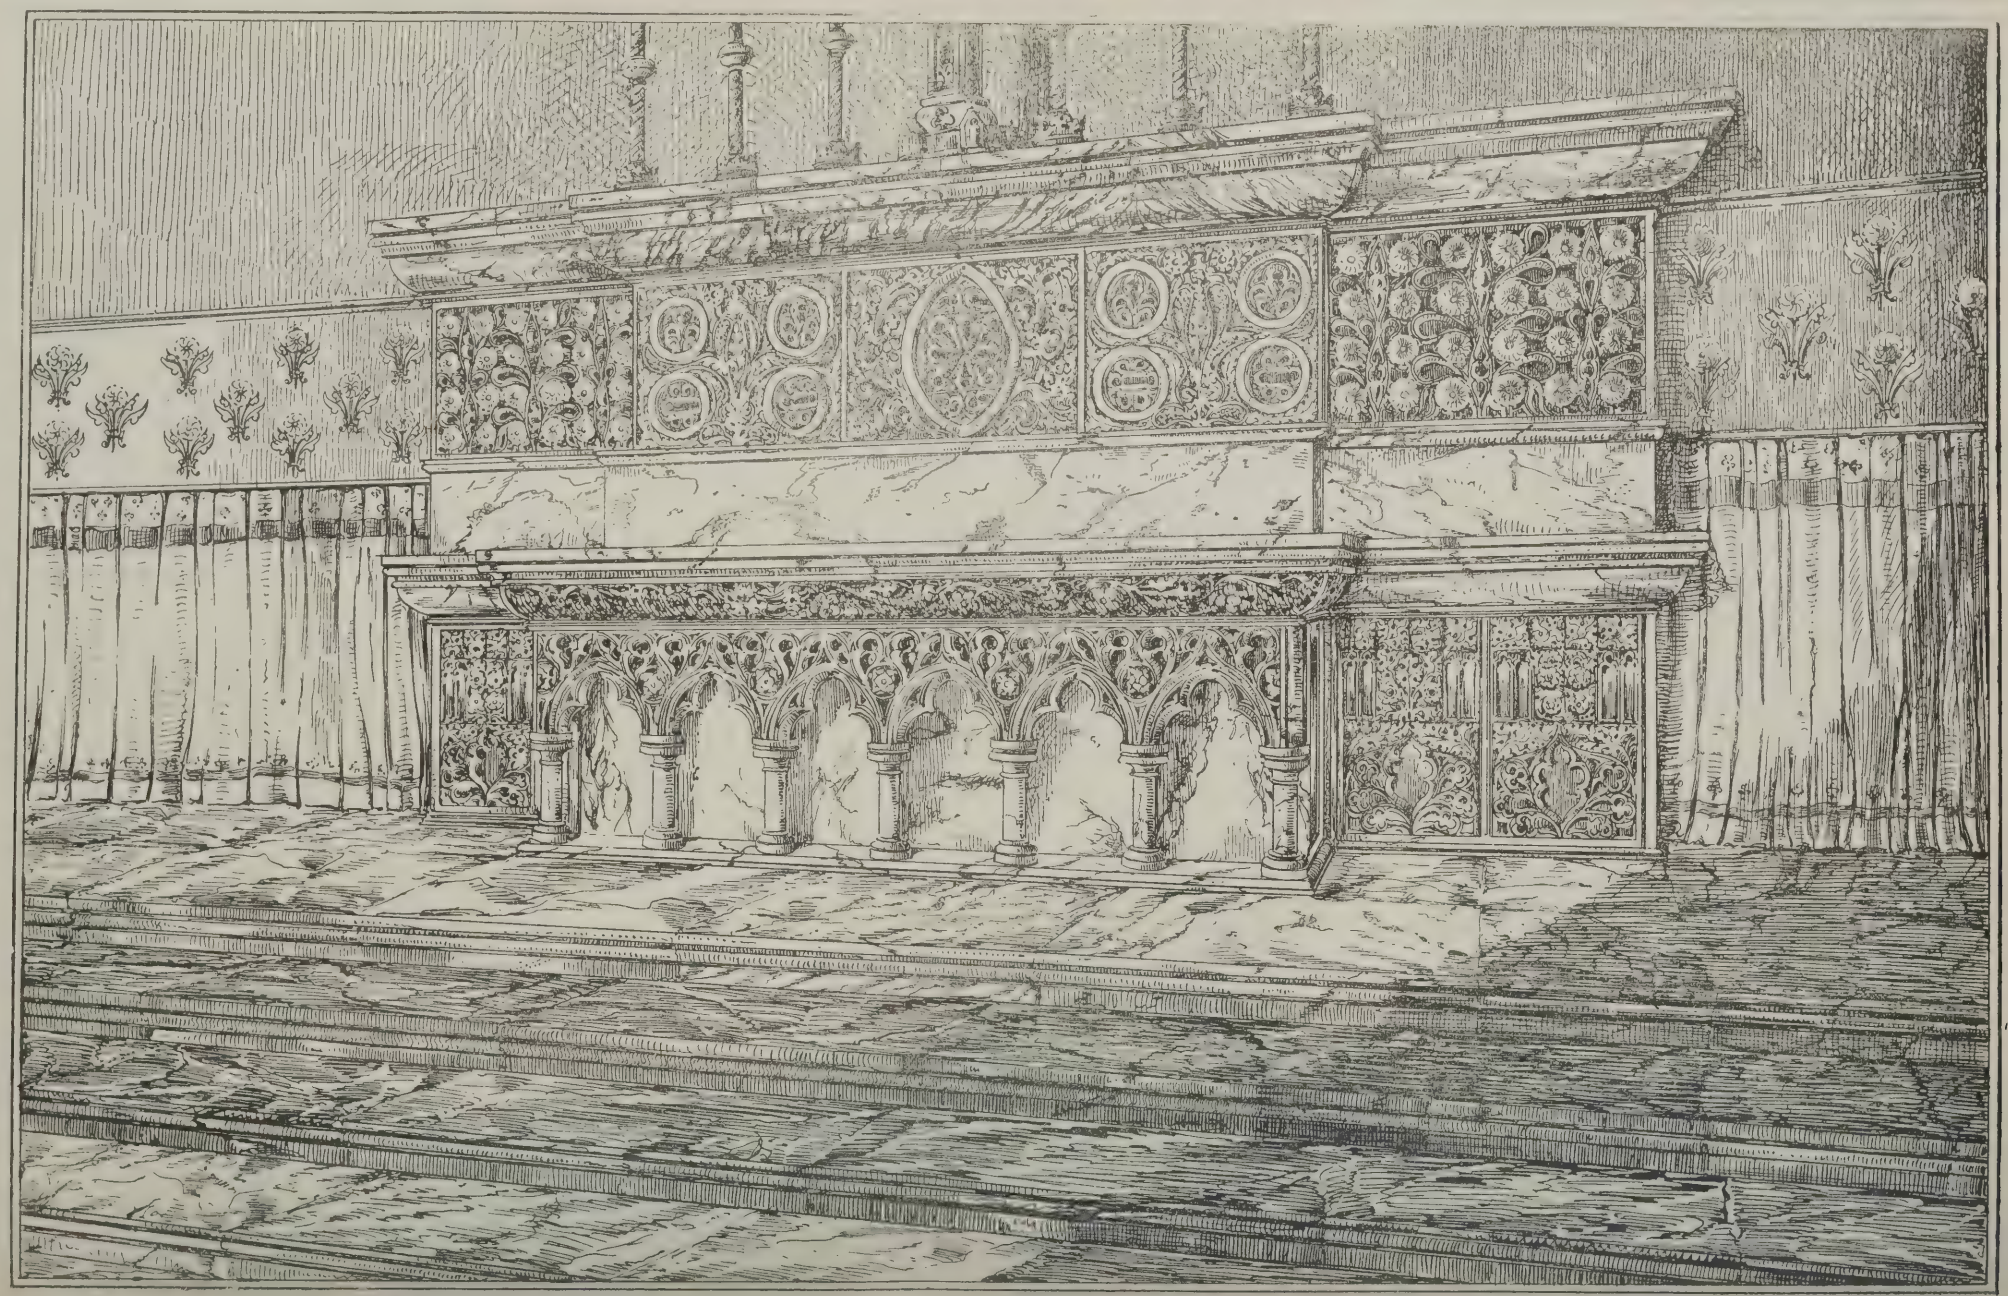
A new Roman Catholic church in Glossop, built in memory of the late Mr. Francis Sumner, cotton manufacturer, was opened on Friday. The structure has cost £12,000, and has been erected from designs by Mr. A. Dempster (Messrs. Dempster and Heaton, Birmingham), in the Early English style. It is situated in the parish of Whitfield. The nave measures 120ft. by 30ft. in clear, side aisles (north and south) are 5ft. wide each, and height to ridge 70ft. The contract was executed by Mr. J. L. Ward, of Manchester.

The Fishermen's School and Institute at Baltimore, near Cork, just completed at the sole cost of the Baroness Burdett Coutts, has been built from plans by Mr. Dominick J. Coakley, by Mr. Sisk, contractor, of Cork. The schoolroom is 28ft. by 26ft. A glass screen shuts off the hall from the other portion of the buildings. The chapel measures 28ft. by 28ft., the dining-room 12ft. by 26ft., and the kitchen 24ft. by 26ft. The large dormitory is 100ft. by 28ft., and there are also attendants' rooms, lavatories, baths, &c.

The Leeds town council have raised the salaries of Mr. E. J. Lloyd, manager of the York-street gasworks, and Mr. G. Tooley, manager of the Meadow-lane gasworks, from £200 to £250 a year.

The will of Alderman John Pearson, of Newton-le-Willows and Liverpool, the well-known railway contractor, has been proved, the personal estate being sworn at £188,866.

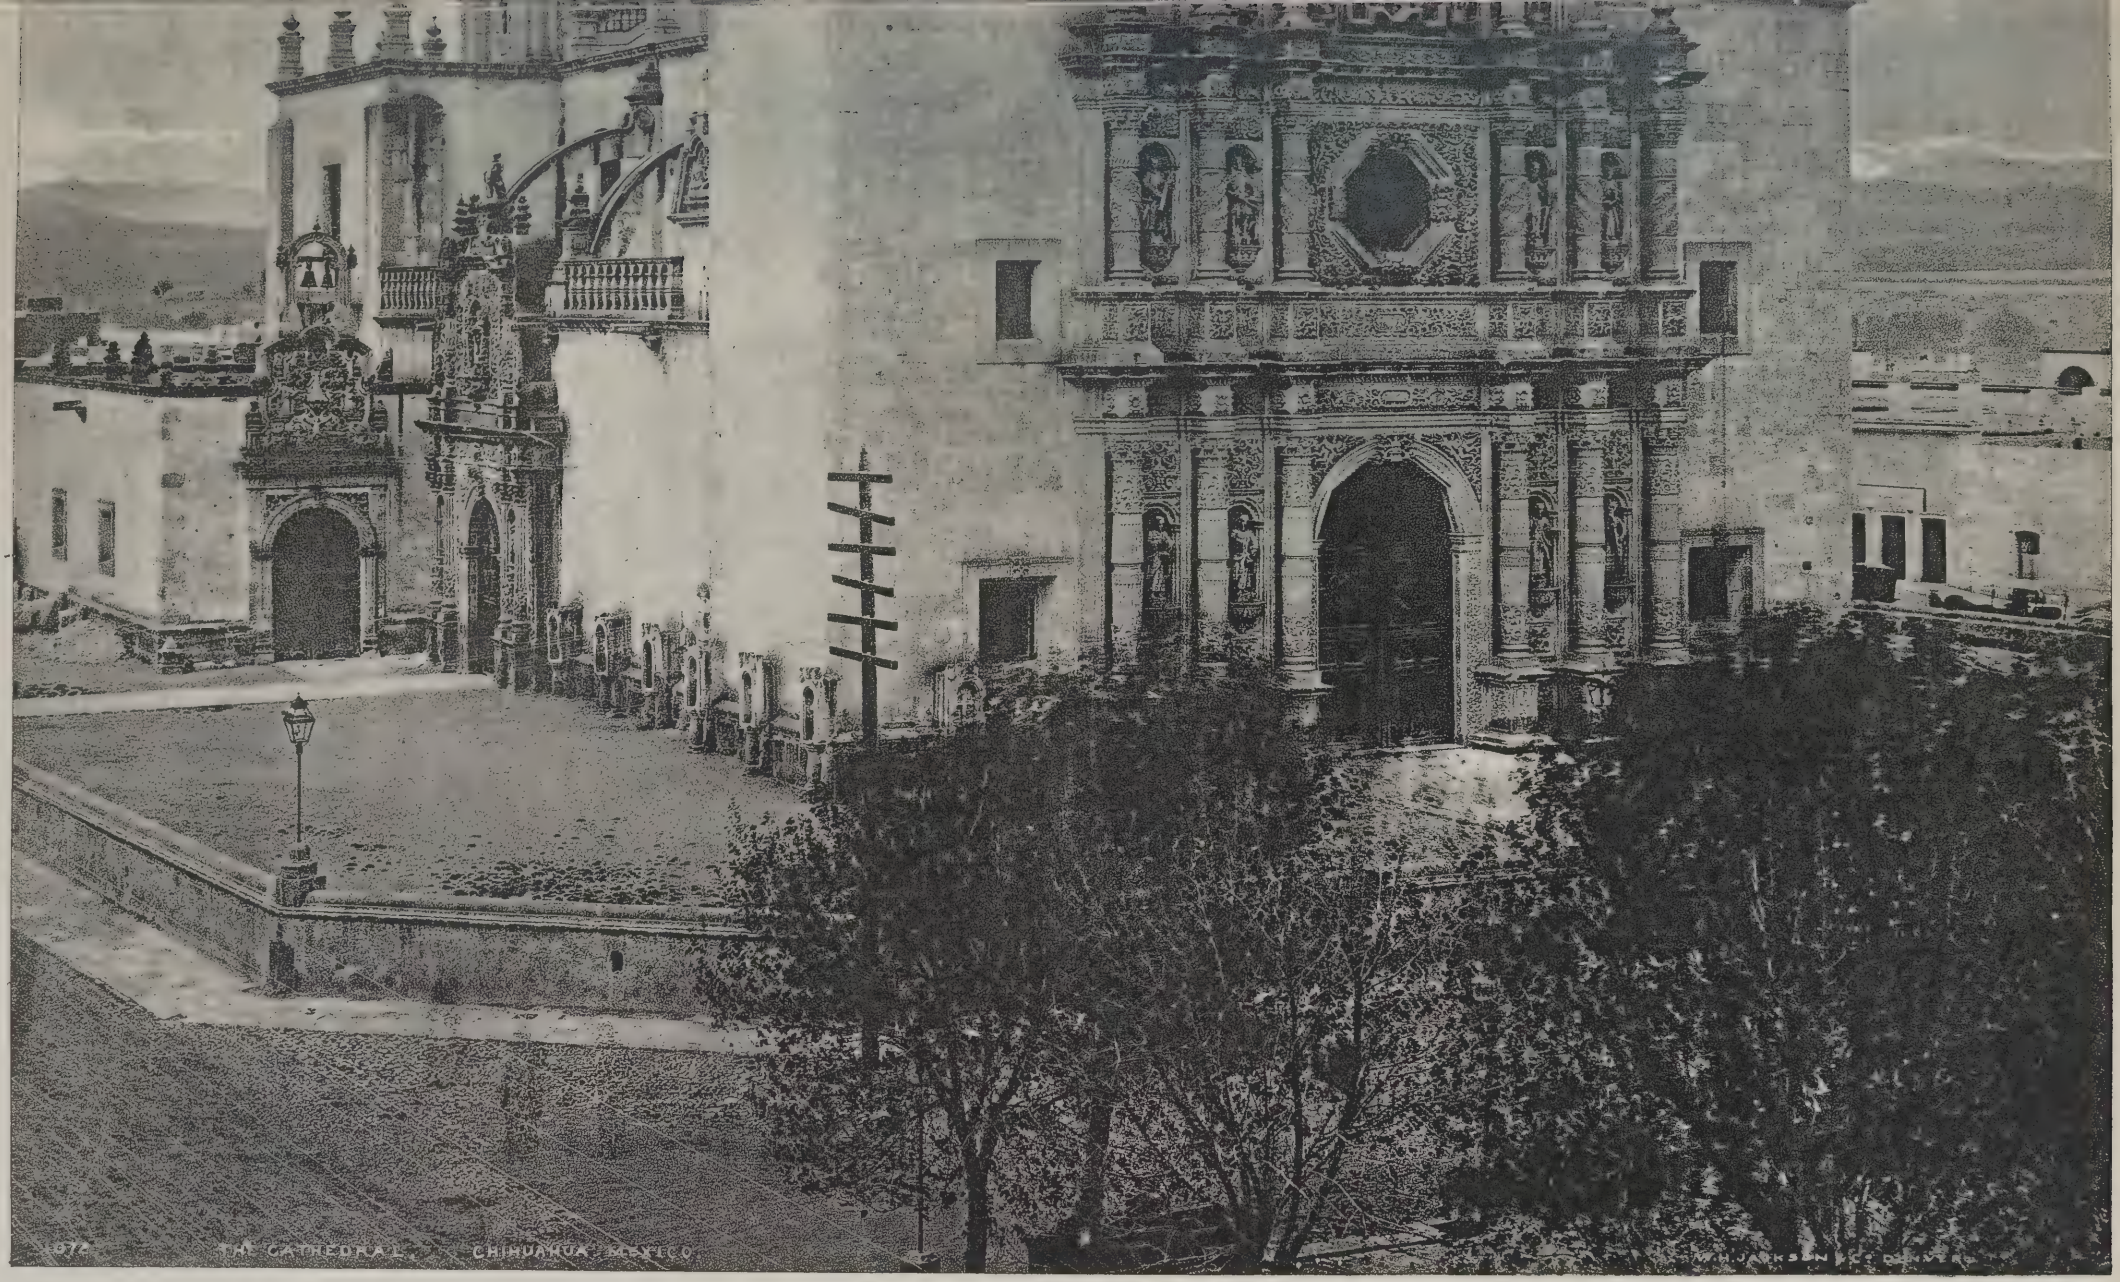
MARBLE ALTAR AND REREDOS FROM THE NEWCASTLE EXHIBITION.



Messrs. Emley and Sons, Limited, of Westgate-road, Neville-street, and Grey-street, Newcastle, and Bothwell-street, Glasgow, have stands in the east and west courts. The section of the east court stand, which will attract most attention, is that in which are fixed the altar, reredos, and a section of the steps and flooring of the sacrarium (all in marble) for St. George's Church, Osborne-road, Jesmond, which Mr. Charles Mitchell, of Jesmond Towers, is building, from designs by Mr. T. R. Spence, London. The carved oak-work of the pulpit upon alabaster bases has been executed in the studio of Mr. Ralph Hedley, New Bridge-street. The altar is executed in Pavonazza marble, which has been very carefully selected, and its colours, by delicate gradations of yellow and rosy tones, melt into the grey-blue markings. Marble work, as a rule, is treated by flat surfaces and shallow sinkings; but here, notwithstanding the extreme difficulty of working so hard a material, are deeply-shadowed sinkings and clear bold outline mouldings. The front of the altar is formed of a detached arcade, composed of elaborate and deeply-pierced tracery, moulded columns, and boldly-carved crown mould. Over the super-altar are richly-carved panels, the detail of which is a novel treatment of tracery forms, following the undulating lines of conventional foliage, thus keeping clearly marked the main elements of the cusped forms, and adding interest to the smaller ornate surfaces. Flanking these panels are wings of a more conventional type, evidently intended to give greater value to the central portion. The whole composition is surmounted by a crown moulding, giving an appearance of great dignity to the design, and forming a substantial base for the superstructure of proposed arcaded recesses under the east window of the chancel. Some care and thought have evidently been expended in giving variety and interest to all the details of carving, and at the same time preserving the unity of bold carving lines throughout the whole design. Much additional effect is gained by placing the altar table on a number of steps made of Pavonazza, rouge, jasper, and Sienna marbles. The work has been executed by Messrs. Emley and Sons.

AN IMPROVED WINDOW SASH.

An improved window sash has been recently patented by Mr. R. A. Lowe, of Chislehurst, which while facilitating the ventilation of a room by allowing the air to enter between the meeting rails, yet leaves the window as securely fastened as when closed. The fastening acts on the principle of the parallel ruler, and two slots are provided in the lower rail into one of which a slip of brass or other material enters when it is desired to fasten the sash in position. The ordinary fastening at the meeting rails is dispensed with, and the upper sash is supported by a catch at the top, which is released by pulling one of the cords, and gentle traction on both then pulls the sash down or returns it to its place, where it is automatically locked. Neither of the fastenings can be reached from the outside without breaking the window, which can thus be left to admit air while as securely fastened as when closed. The patent fastener acts as a draught preventer, and also holds the sashes tight enough to prevent them rattling, while sashes of any size are easily manipulated.



A movement is on foot to purchase Carron House, South Lambeth-road, and secure its grounds of some eight or nine acres for a park. The freeholder (Mr. Cobeldick) has offered to sell the estate for £47,500, and the matter has been some time under the consideration of the Lambeth Vestry, who have referred the question of the purchase back to the Open Spaces Committee. A public meeting was held on Saturday to urge upon the vestry the desirability of accepting Mr. Cobeldick's offer, provided the Metropolitan Board of Works would contribute half the amount.

A presentation portrait of Sir James A. Picton, F.S.A., F.R.I.B.A., is being executed by Mr. W. B. Boadle, for hanging in the board-room at Wavertree. It is to be presented to Sir James by his friends on his retirement from the chairmanship of the Wavertree Local Board.

DRAWING BY THE LATE FRED. C. DESHON ARCHT.

LIBRARY, RALEIGH HOUSE, BRIXTON.

RALEIGH HOUSE, BRIXTON. VIEW FROM THE LAWN.

RALEIGH HOUSE, BRIXTON.

ANYONE with his eyes about him, on walking up Brixton-rise, will surely have noticed, through the trees, on the left-hand side of the way, a couple of old Elizabethan gables and a few chimney-pots mellowed by the hand of time, and standing far back from the bustling road. That is about all that can be seen from the Rise; but on turning down the lane, and past the lodge, a better view can be obtained of the house, or rather a part of the house, in which the great navigator lived, and whose name it bears. The reason we give our illustration to-day is because the house and grounds, "some twelve and a half acres," with fine timber on it, has been put up for auction, and fortunately, no bid sufficiently high being reached, it was withdrawn. We also give an interior sketch of the drawing-room, which now does duty for a library. The quaint old chimney is the best feature in the room. The panelling is somewhat irregular, and we regret to say that numerous coats of paint have covered the wood, which we find is mostly oak. The door is modern. The room above this (a bedroom) is quite as interesting, and would well repay restoration. We show the old dogs and open hearth, but a modern fireplace cumbers the present opening. It is stated that Queen Elizabeth often visited Sir Walter in this house, coming in her barge up the now hidden Effra; and rumour also states that it was here Raleigh spread his cloak over the pool for her Majesty to step on. However this may be, we sincerely hope that the old house and grounds may long be preserved from the speculating builder.

A crowded meeting was held on Wednesday evening at Brixton Hall, Mr. Fowler, member of the Metropolitan Board of Works, in the chair, when resolutions were unanimously passed as to the desirability of the Metropolitan Board of Works and Lambeth Vestry acquiring the grounds of Raleigh House for £40,000 for the purpose of a public park for Brixton, and that a committee be formed to enter into negotiations with the Board of Works and the vestry for that object.

A STEEL ROOF OF GREAT SPAN.

ROOFS of great span are not uncommon in England. Till the construction of the iron roof over the Olympia at Addison-road, St. Pancras station roof, which has a span of 239ft., held the reputation of being the greatest. But these roofs are to be exceeded by one designed in connection with the Machinery Palace being erected for the French Exhibition of 1889. The project of a machinery gallery was decided upon in May last, and the work was submitted to contract. M. Dutort is the architect of the machinery palace, and, with the aid of MM. Contamin, Charton, and Pierron, the details of the metallic pieces have been arranged. The gallery is constructed entirely of steel—the first great exemplification of the value of steel for structural purposes of this kind, and when finished the structure will embody the progressive developments made in the art of the engineer. The gallery will be of rectangular shape in plan, having a length of 1,387ft. and a width of 492ft., or an area of 672,404 square feet. The main span will be 362ft. clear of tie rods. Each truss forms a four-centred arch of bold springing curvature, and will consist of two half arches resting at their bases and apices upon pivots. Each rib is on the open lattice principle, with long and short panels. These are connected by vertical purlins, four on each side of the apex. The maximum height from the ground to the apex or upper pivot is 147·5ft., which height would allow the Vendome column to stand beneath. Open spandrel pieces of iron fill up the ribs at the haunches, by which the roof covering is continued straight to the outer guttering. There are nineteen bays. The centre bay is 76ft., and the others 70ft. each in width, and the end ones each 83ft. Projecting pavilions roofed on a lower level abut against the central hall, thus adding greatly to the total superficial area. By the employment of steel, M. Contamin and his colleagues have been able to obtain strength with extreme lightness, so that the trusses will not exceed 24lb. per square foot. If this be so, the gallery will possess the lightest metallic roof of any exhibition. The former exhibitions had metallic frameworks, weighing from 30lb. to 34lb. to the square foot. Though it is not safe to compare structures of different design, it would appear the experiment at the Machinery Palace of the Paris Exhibition of 1889 will confirm the opinion of engineers that steel can be used for roofing with economic results that cannot be obtained in iron.

The foundation-stone of a new church at Overstreet, Dodderhill, two miles from Droitwich, was laid on Friday. The church, which will accommodate 348 persons, will be in the style of the 14th century, from the designs of Mr. L. Sheppard, of Worcester. It will cost £3,000, the contractor being Mr. Jonathan Brazier, of Bromsgrove. It will be built of Malvern Hill stone, with Bath stone dressings, and the interior will be of red bricks, with similar dressings. The floors will be of wooden bricks, and the passages of encaustic tiles. The dimensions are—nave, 70ft. by 28ft.; north and south transepts, 13½ft. by 15¾ft.; and a chancel, 31ft. by 19ft., together with organ loft and vestry. The church, which will be a chapel-of-ease to Dodderhill, will be called St. Mary de Wych.

The memorial stone of a new Free Presbyterian church now in course of erection in the village of Grant's House, was laid last week. The church is to accommodate 250 worshippers, and is being built from plans by Messrs. Chalmers and Robson, of Glasgow.

WAYSIDE NOTES.

IT is quite impossible, whilst hastening over the hills of Normandy, to keep pace with any current topics of the architectural world in old England. Possibly I have been a little negligent in not having any papers forwarded me here—not even the "B. N." It is true I did get a glimpse at some London journals one day old whilst at Trouville a day or so back, but did not learn much excepting that there had been a perfectly marvellous display of natural electric lighting in the metropolis. This, doubtless, was coincident, or nearly so, with a heavy thunderstorm that favoured us at Evreux. The darkening cloud and vivid lightning gave some curious effects of light and shade in the cathedral of that peaceful Norman town; but I did not observe any eccentricity on the part of the electric fluid, and feel certain that there was no exhibition of fireballs or thunderbolts after the manner of the London storm. But as regards current architectural topics I must confess complete ignorance, and crave the reader's pardon for dilating herein on a small portion of the old architecture of Calvados.

After leaving Rouen I visited Evreux, aforementioned—a town doubtless known to many and by everyone who professes to know Normandy at all thoroughly. A very typical town is Evreux, nestling amongst beautiful hills and surrounded by the ubiquitious, though very pretty, apple orchards, and possessing a fine cathedral and an interesting church. The choir of the cathedral is being restored (at the rate of two stones and three-quarters a day, I should think), and, consequently, admission to the same is only to be gained by winning the heart of the stately "Swiss" who here reigns supreme. His stern countenance relaxes considerably at the sight of one franc, but if this amount be doubled a pleasant smile plays about the corner of his lips, and you know that there is little to prevent your sketching what you may choose in the choir and portions of the building where the restorers are at work; and it is only in the choir of Evreux Cathedral that one can see the fine stained glass in the clerestory. The apse contains some windows absolutely jewel-like in splendour, and there is a peculiar-tinted green that glows in small fragments with the brilliancy of an emerald. Yet this is nothing to the magnificent effect of Chartres. As regards the exterior of the cathedral, there is a wonderful piece of Flamboyant work in the north transept.

The church of St. Taurin at Evreux is, in some respects, more interesting than the cathedral. It has a very pleasing lantern tower, the external effect of which is very good. But what one cannot but admire most about this lantern is its peculiar plan. The choir and transepts were evidently rebuilt with the lantern, in the 13th century. Not finding the original width of the church sufficiently great to please them, the builders of the lantern extended the east side of this feature by making the chancel arch some 2ft. 4in. wider than the arch into the nave. Consequently the walls of the lantern are thrown out of the square. The effect is very quaint, and the bold frankness of such a proceeding and total disregard of precedent seem to me very admirable. St. Taurin's is now being restored at the west end, though the work in hand only comprises a very commonplace sort of Renaissance portal.

Conches is not many miles from Evreux, and is a quaint Norman market town with an interesting church and ruined stronghold. The church has many points of interest to the sketcher, and possesses a beautiful unrestored west portal with excellent Flamboyant carving. A gem of a door in the chancel would alone be worth going to see. There is some work being done in the church at present—a number of new side altars are being erected from plans by M. Darcy, of Paris. I really do not think I have ever seen such excellent modern Flamboyant carving as is now being turned out by two sculptors in Conches church. But on my telling them it was as good as the old work they modestly declared that such a thing was impossible. At any rate, however, it was next door to the old carvers' work. There is a little town or village between Conches and Bernay, called Beaumont-le-Roger, which I believe has some most interesting architectural remains; but I could not find time to visit the place. There is (perhaps unfortunately) a powerful loadstone tempting me to hurry through the Norman towns, and leading me in the direction of the Brittany coast; and that is the desire to behold the mass and outline of Mont St. Michel.

Bernay, on the Charentonne, possesses a peculiarly interesting church—St. Croix. On entering the building it almost has the effect of a large English parish church. This is chiefly because of the absence of side chapels to the nave aisles. Both this building and the church of Notre Dame de la Couture have typical quaint Norman "slate-hung" spires or belfries—that of the latter edifice especially being most quaint in design. Not very far west of Bernay is the pleasant town of Lisieux, with its magnificent church of St. Pierre. The interior of this building is the finest perspective view I have seen since leaving Rouen. The choir, lantern, and transepts are exceedingly chaste in design; and, as if to be in harmony with the architecture, the decorations of the church appear to be always in the best taste, either when the high altar is neatly draped or when it is resplendent with flowers. The west front of this building will be familiar to all with its towers of varied design — the one with a pleasing spire, and the other with a tiny pyramid of tiles glowing with the golden hues of many-coloured mosses and lichens. The market-place is most interesting in the mornings, and together with the cathedral forms a charming picture. Of the old timber houses, it will be unnecessary for me to speak. They are well known. I note, however, that there are several reproductions of them in the marine residences of Trouville, though the modern French architect is not to be seen at his best in such work.

It is difficult to know what and when to sketch at some places and times. Very frequently it would be pure waste of time; there is so much to see. Here, at Caen, there are some eleven or twelve old churches, including the magnificent Abbaye aux Dames—a beautiful building. It is evident one cannot make views of each from the due north, south, and east. Perhaps the best course is to take photographs to show the composition and outline, and to make sketches only of strikingly beautiful features and detail.

GOTH.

BOOKS RECEIVED.

First Lessons in Science, by the Right Rev. John William Colenso, D.D., Bishop of Natal (London: William Ridgway), is a series of easy lessons on astronomy, and drawn up for the use of a class of natives in the late Bishop Colenso's diocese a quarter of a century ago. They have been republished with suitable diagrams, and are presented to English readers. The late Dr. Colenso's mathematical treatises, notably his school arithmetic and algebra, are familiar textbooks to every schoolboy, and even now are acknowledged to be unsurpassed for clearness and accuracy. The present lessons begin in very simple language to explain the form of the earth, the proofs of its sphericity, its original composition or molten state, the formation of the crust, the strata, and then go on to describe the laws of matter, the planetary worlds and stars. The mathematics of the subject are very clearly conveyed, and the author's little book is a better introduction to the science, in explaining the meaning of meridians, poles, orbits, ecliptics, &c., than half the elementary books published.——*English Carpenters and Foreign Competition.*—Mr. Banister Fletcher, F.R.I.B.A., has published (through B. T. Batsford, 52, High Holborn) as a compact pamphlet his lecture on this subject, delivered at Carpenters' Hall on March 2nd last, and given in our columns the same week. It is illustrated with woodcuts of carved hall stands, a picture frame, chairs, &c., executed by carpenters, and contains much information as to the state of trade and many suggestions and hints put in a readable form.

The new Commercial, Industrial, and Ethnological Museum at Antwerp was opened on Monday.

COMPETITIONS.

DEPARTMENT OF SCIENCE AND ART.—The list of successful candidates for Royal Exhibitions, National Scholarships, and Free Studentships for the present year have just been published. The Royal Exhibition has been taken by Geoffrey Marshall, of Glasgow. National Scholarships (twelve) have been awarded to Samuel H. Studley, of Bradford; David Wilkinson, Preston; Sydney Wood, Bradford; William S. Jarratt, Bradford; George N. Huntly, Richmond (Surrey); Henry Stanton, Bristol; Samuel W. J. Smith, Newcastle-on-Tyne; Frederick W. Jones, Nottingham; John Smith, Belfast; William G. Robson, Newcastle-on-Tyne; Ernest G. Coker, Wolverton; and Henry C. Riley, Manchester. Royal Exhibitions (six) have been gained by Frederick W. Dunn, Bristol; Jacob Marshall, Sheffield; Samuel Parrish, Manchester; Joshua Holden, Todmorden; Mr. T. M. Ormsby, London; and Samuel Pickford, Stockport. The six Free Studentships are awarded to Arthur W. Widdop, Bradford; George W. Moreton, Crewe; John B. Jaquet, London; Malcolm Roberts, Bradford; Herbert H. Balme, Halifax; and George J. Wells, London.

"OWEN JONES" PRIZES, 1887.—This competition was instituted in 1878, by the Council of the Society of Arts, as trustees of the sum of £400, presented to them by the Owen Jones Memorial Committee upon trust to expend the interest thereon in prizes to "Students of the School of Art who, in annual competition, produce the best design for Household Furniture, Carpets, Wall-papers and Hangings, Damask, Chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes are awarded on the results of the annual competition of the Science and Art Department. Six prizes were offered for competition this year, each prize consisting of a bound copy of Owen Jones's "Principles of Design," and a bronze medal. The following are the successful candidates for the present year:—(1) Gertrude M. Ginn, School of Art, Hertford, design for floor tiles. (2) Jane B. Glanvill, School of Art, Cavendish-street, Manchester, design for carpet; design for cotton print. (3) Robert H. Slowan, School of Art, Glasgow, design for printed hanging. (4) Fanny Roylance, School of Art, Cavendish-street, Manchester, design for printed cotton (5) James West, School of Art, West London, design for wall-paper. (6) John Macfarlane, School of Art, Cavendish-street, Manchester, design for table-cover.

THE WHITWORTH SCHOLARSHIPS, 1887.—The following are the successful competitors for the Whitworth Scholarships:—James Whitaker, of Burnley, £200; John Calder, Glasgow; John Smith, Belfast; Nicholas K. Turnbull, Glasgow; James C. Talbot, Southampton; Arthur F. Horne, Moreton-in-Marsh (formerly of Glasgow); Edward J. Duff, Glasgow; Robert N. Blackburn, Liverpool; and William Thomson, Glasgow, each £150. William W. F. Pullen, Cardiff; Edwin Griffith, Glasgow; Frederick C. Tipler, Crewe; Thomas H. M. Bonell, Swindon; Richard J. Redding, Plumstead (Woolwich); Arthur W. Sisson, Lincoln; Arthur H. Abbott, Great Yarmouth; George Hough, Wolverton; Harry G. Christ, London; Harry D. Griffiths, Cardiff; Denholm Young, Edinburgh; Benjamin G. Oxford, Liverpool; Bernard H. Crookes, Liverpool; George J. Wells, London; John Eustice, Camborne; and Augustus H. H. Bratt, Plumstead (Woolwich), each £100.

During the clearing out of a well at Westwood Farm, near Peterborough, a large piece of carved stone was brought up from the bottom. It turned out to be a triple wash-basin from the ancient lavatories in the cloisters of the Benedictine monastery, now the cathedral. It was no doubt purchased, after the destruction of the cloisters, to form a sound bottom to the well.

In pursuance of the plan of restoration of the parish church of Witheridge, Devon, another of a series of stained-glass windows has been placed in the south aisle. Being opposite the font, the design is that of a baptismal window. In the three large compartments are the Children of Israel crossing the Red Sea; Our Lord's Baptism by John; and Naaman at Elisha's door being ordered to wash in Jordan. The window is by Mr. F. Drake, of Exeter, and the stonework by Messrs. Young, of Barnstaple.

Building Intelligence.

Armley, Leeds.—The new cemetery at Armley was formally opened on Saturday. Having secured a site of ten and a half acres, the board invited designs for laying out the ground and for the erection of a chapel and lodge, and Mr. J. P. Pritchett, of Darlington, was unanimously selected, out of forty-three competitors, to carry out the work. The ground is laid out on the rectangular plan, as far as possible, so as to economise space, though a curved road and paths occupy the front portion, which will not be used for interments. At the entrance there is a pair of carriage gates, with foot gates at the sides and an iron railing to correspond, relieved by the introduction of stone pillars at intervals. The lodge, in addition to the dwelling-house, contains board room, waiting room, and other offices. The structure is Domestic Gothic in character. The chapel is approached by a curved road, and is in the Perpendicular style. The entrance-porch is surmounted by a lantern and spire, 73ft. high. The chapel is 40ft. by 20ft., and has sitting accommodation for 120 persons; the east end is apsidal. Adjoining is the mortuary, 10ft. by 10ft., separated from the chapel by a glazed screen. The windows are glazed with muffled cathedral-tinted glass, with coloured margins, bands of roundels at intervals, and devices in the heads. The cost of land was £275 per acre; on the buildings £2,780 were expended, and the wall round the cemetery, road making, and drainage, cost £1,330.

Budleigh Salterton.—Considerable improvements have of late years been made in this town by the pulling down old and dilapidated properties and erecting in their places good and substantial business premises. One of the most recent, and certainly one which entirely differs from any other building in the town, is a butcher's shop and dwelling-house erected by Mr. John Walters. The shop, which is about 22ft. square, is lined with white-glazed bricks, and has marble show slabs supported on turned legs around three sides, and the whole of the fittings are in accordance with the latest improvements. The design is executed in red brickwork; the carved portions from Messrs. Lawrence and Son, Bracknell, and for moulded cornices and strings from Mr. James Brown, London. The carving was done by Mr. S. Allen, Upper Holloway. The style adopted is Queen Anne, and the building has been carried out by Mr. J. G. Stephens, of Exeter, under the superintendence of Messrs. Wilkinson and Warren, architects, of that city.

Bovey Tracey.—Reopening services were held at the parish church of Bovey Tracey, Devon, on Thursday week, after restoration. The church is in the Perpendicular style, and comprises a chancel, nave, two north aisles, a south aisle, and western tower. The floor of the nave has been lowered to its original level, somewhat below that of the chancel, and there has been a rearrangement of seats. The columns of the arcade have been renovated and the font dechiselled, the traceries of the windows also receiving attention. The floor of the chancel is entirely relaid with Devonshire marble; the walls have been relieved of the dingy plaster, and a new east window of stained glass has been inserted. Choir benches will shortly be fixed. The screen, which contains some very rich work, and the lower panels of which contain painted figures, which have been said to typify the union of Church and State, has been restored. The church is heated by a new system, by Messrs. Longden and Co., Oxford-street, London. The general work, which also includes the erection of a vestry on the north side of the chancel and external renovations, has been carried out by Messrs. Trask, of Norton, Minster, from the designs of Mr. J. D. Sedding, of London. The cost was £1,500.

Glasgow.—Satisfactory progress is being made with the erection of the Exhibition buildings in Kelvingrove Park. The prospectus of the Fine Art Section has just been issued. It is stated that special care will be taken in the construction of the Fine Art Galleries to insure their being thoroughly damp-proof and fireproof. The walls will be of brick, the roof of steel or iron, and the building practically isolated from the other parts of the Exhibition buildings. The galleries are ten in number, occupying an area equal to 3,200 square yards, and affording about 2,450 lineal feet of hanging space. It is proposed that objects illustrative of Scottish history and archæology should be placed in a separate building specially constructed for the purpose. Special attention will be given to the safety of the Fine Arts Galleries. Electric light will be used throughout the Exhibition, and the mode of its application in the Fine Arts Galleries will obviate the risks incidental, under other conditions, to the use of artificial lights.

Manchester.—Another section in the restoration of the only genuine inhabited relic of "Old Manchester" remaining — Chetham College and Library—has just been completed from plans by Mr. Medland Taylor—viz., the cloisters. They are situated on the north-west and south sides of the great hall or refectory, forming a miniature quadrangle, and remain almost exactly as they were when Thomas Lord de la Warre, the last rector of Manchester, founded the college at Hunt's Bank between 1421 and 1426. As Mr. Henry Taylor, in his "Old Halls of Lancashire and Cheshire," remarks:—"The cloisters here are two-storied, a somewhat rare occurrence in buildings of this character; in the Oxford Colleges, for example, there are rooms over parts of the cloisters, but in no instance that I am aware of are they built on the two-storied principle." New mullions in the windows have been introduced where absolutely necessary, the greater part of the old masonry and tracery remaining intact. In the restored masonry Runcorn red stone has been introduced, and harmonises with the original Collyhurst stone of which the cloisters were built. At the east end of the cloisters an old retiring-room has been cleared away, opening out the original entrance to the audit-room, in which apartment a whitewashed plaster ceiling has been removed, showing the original solid oak rafters. The cloister windows north and south sides of the quad are being glazed with white cathedral glass in the Elizabethan style, as seen at Agecroft Hall and Bramhall Hall. At the south end of the cloisters, near the entrance to the library, a grille of hammered iron, designed by Mr. M. Taylor, containing the initials and coat of arms of Humphrey Chetham, the founder of the hospital, is being fixed. In the large dining hall a stove has been removed and the original fireplace opened out; also a window has been opened out into the cloister court. Further improvements and restorations are contemplated. The masonry restoration has been carried out by Messrs. Ellis and Hinchliffe, of Manchester. Some 300 members of the British Association have intimated their intention to visit the college on Tuesday week, Sept. 6.

Mainstone.—The parish church was reopened last week after rebuilding from plans by Messrs. Nicholson and Son, of Hereford. The church was previously little better, as regards the fabric, than a ruined barn. The walls were bulged out, leaning over, and very irregular, being only upheld by modern additions of the rudest kind of masonry, applied as buttresses, not only externally, but within the chancel itself. Over the nave, however, though concealed by plaster, was an oak roof of great beauty and elegance, both as regards design, construction, and finished workmanship, and it was accepted as the motive for the entire reconstruction of the church. The church, as rebuilt, consists of nave, chancel, south porch, sacristy, and a parish room. The length of the nave, 55ft., was determined by the proportions of the ancient roof. This roof, which has been restored, is constructed of arched principals, intricately moulded, stopping upon bases, which themselves set up stone corbels. Intermediately between the arched principals are moulded rafters; and moulded purlins, three in each side of the roof, form a series of panels, 84 in number, each adorned with quatrefoils, behind which are seen the ordinary rafters. To keep this roof intact the old walls were taken down, one at a time, the roof cradled and shored, and the new walls built under. The chancel, 24ft. long, is covered with a new oak roof, similar to that over the nave, and is separated from the nave by a chancel arch. The style adopted in the rebuilding is that of the latter part of the 15th century. The south porch is timber-built. The west wall of the nave is surmounted by a double bell-cote, in which are hung the ancient bells. There are new floors, sittings, stalls, pulpit, and lectern. The bowl of the Norman font has been remounted upon a new base and kneeling step, and set in the old position. The whole of the work has been carried out by Mr. W. C. Bright, of Bishop's Castle.

Sutton Coldfield.—The new building of Bishop Vesey's Grammar School was opened last week. The building is a block 60ft. by 56ft., and three stories in height. It adjoins the old house of the head-master. The style adopted is 17th-century Renaissance. The ground story comprises a chemical laboratory, a hall, lavatory, assistant master's room, and dining-room, with serving hatches from old kitchen. On this floor are also the chamber for heating apparatus, china closets, &c. The corridors are lined to half their height with white glazed bricks, and are panelled with brickwork. A stone staircase leads to the upper floors, the first of which contains the school-room, 58ft. by 27ft. 6in. and 20ft. high, lighted by ten windows. The room has a large recess near one end, making the ground-floor an L-shape. This room is warmed by hot water, and has also a fireplace at each end. At the back of the schoolroom, divided from it by a corridor, are three class-rooms, each 17ft. 6in. by 15ft. 3in. Over the class-rooms, included within the height of the school-room, are three bedrooms, corridor, bath-room, and other conveniences. Over the schoolroom are a large dormitory, a linen-room, infirmary (heated by hot water), bath-room, and housemaid's closets. Improvements have also been made to the old buildings to adapt them to the new arrangements. The cost of the new buildings and alterations to old premises, will be about £4,500. Mr. J. A. Cossins, of Corporation-street, Birmingham, was the architect, and Messrs. J. Bansley and Sons were the contractors.

CHIPS.

Mr. Percy Gardner has been elected to the chair of archæology at Oxford, vacant by the transfer of Professor Ramsay to Aberdeen. Mr. Gardner will resign his post in the medal-room at the British Museum, also the Disney professorship at Cambridge, which he has held since the resignation of Professor Babington.

The death is announced of Mr. William Rains, chief sanitary inspector of the parish of St. George's-in-the-East, and one of the originators of the Association of Public Sanitary Inspectors, on the council of which body he had served.

The ceremony of laying the foundation-stone of the new public buildings of West Hartlepool was performed on Thursday, the 18th inst. The building, which will be of red brick, with terracotta facings, will provide accommodation for the school board, the sanitary inspector, the overseers, and the collector. There will also be a board-room, 45ft. 6in. by 25ft., extending along the entire front. It will be in the Queen Anne style, and the cost will be about £6,000. Mr. Joseph Howe, of Newcastle, is the contractor, and Mr. Freeman, of Manchester, the architect.

A group of public buildings is about to be built at the corner of High-street and Bridge-street, Lockerbie, from plans by Mr. Frank Carruthers, of that town. The buildings will comprise market hall, large and small public halls, town clerk's offices and committee rooms, and the proposed outlay is £4,000, exclusive of site.

The office of Keeper of the Royal Academy, rendered vacant by the resignation of Mr. F. R. Pickersgill, R.A., was at the general assembly last week voted to Mr. P. H. Calderon, R.A.

The vicar and churchwardens of St. John's Church, Chester, a church formerly of cathedral rank, have taken a step which will be welcomed by the citizens of Chester, and by the architectural students and other visitors. They have arranged to have the church open for a great part of each day, so as to afford full opportunity for the study of this interesting building. Sketchers will be pleased to hear that they will not be "expected to give" the largest sum the personal appearance of the visitor warrants the doorkeeper in demanding as at St. Bartholomew the Great, Smithfield.

Dr. G. W. Marshall, the author of "The Genealogist's Guide," has been appointed to the post of a Rouge Croix in Her Majesty's College of Heralds.

The Huddersfield town council have raised the salary of Mr. Stainway, the waterworks manager, from £360 to £400 a year.

Engineering Notes.

Association of Municipal Engineers and Surveyors.—The fourth examination by this Association of candidates for the offices of municipal and local board engineers and surveyors will be held at the Town Hall, Manchester, on Friday and Saturday, the 7th and 8th of October next. Intending candidates must send their applications on or before Monday week, September 5th. A Midland District Meeting of the Association will be held at West Bromwich, on Saturday, the 3rd prox. A meeting will take place in the Council Chamber, Town Hall, and visits will afterwards be made to Messrs. J. and S. Roberts' foundry (pipes, &c.) at Swan Village ; and to Mr. Joseph Hamblet's brick and tile works, and the works in progress at the boating lake and swimming bath, Dartmouth Park. On the return to the Council Chamber in the afternoon, Mr. Chas. Jones, Assoc.Inst.C.E., of Ealing, will read a paper on "The Destructor," to be followed by a discussion.

Alum Bay, I.W.—The new pier at Alum Bay is now practically completed. Mr. James Lemon, M.I.C.E., of Southampton, designed the structure, and Mr. H. I. Sanders, of the same town, was the contractor. The total length is 377ft., being 30 or 40ft. longer than the old one. The promenade is 273ft. 6in. long by 12ft. wide, and the head 103ft. 6in. by 44ft. The depth of water at the head will be 10ft. at low water springs, and accommodation is afforded for a steamer on each side, with necessary landing stages. The only parts of the pier not of iron are the bollards, fender piles, and flooring. The entire length of the promenade is arranged for seating.

Northern Municipal and Sanitary Engineers.—On Saturday, a Northern Counties District meeting of the Association of Municipal and Sanitary Engineers and Surveyors was held in the Council Chamber, Newcastle, Mr. G. W. Laws, City Engineer, in the chair. Mr. Dawson, of Benwell, was eventually unanimously elected to the position of district secretary, in succession to Mr. Thompson, who has retired owing to illness, and to whose family a vote of sympathy was passed. The Chairman then read a paper prepared by himself on "The Floating Hospital of the Tyne Port Sanitary Authority," describing the hospital in detail. A discussion followed.

Roath Dock, Cardiff.—The new Roath Dock, Cardiff, is now completed, and was opened on Wednesday by the youthful Earl of Dumfries. It is filled to a depth of 30ft., and is 35 acres in area. The dock is 2,400ft. long and 600ft. wide, giving quayage accommodation to the extent of 7,920ft. in addition to that at the Roath Basin, which is 1,000ft. long and 550ft. wide, with an area of 12 acres. The contract for constructing the dock was taken by Messrs. Neilson and Co., of Carlisle. The masonry was done by them, and 250,000 cubic yards of solid stone have been supplied from the quarry of the Marquis of Bute at Rwllypant. Nearly 3,000,000 tons of earth were removed in making the dock, most of which was tipped on the foreshore for railway sidings leading to the dock. The new dock is at present the largest in England. Calculating the value of the stone supplied by the Marquis of Bute, the dock has cost over £500,000.

The Barry Dock and Railway.—The engineers, Messrs. Brunel, Forster, Browne, and Co., report that about 1,600,000 cubic yards of earth remain to be excavated at the dock, and this at the present rate will occupy about 10 or 12 months. The masonry of the dock will occupy about the same time to complete. The railway works are proceeding satisfactorily. The two headings of the Wenvoe Tunnel have joined, and the work of cutting the tunnel itself is proceeding well. The Pontypridd Tunnel has been begun, and it may be expected to be completed in the early part of 1888. The contract for the dock gates has been taken by the Thames Ironworks and Shipbuilding Company, and they are in progress. It appears that the dock will be ready for opening in 1888.

The partnership between Messrs. Littlewood and Aston, Great James-street, Bedford-row, W.C., architects and surveyors, has been dissolved.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Cambrian Archæological Association.—The forty-second annual meeting of the Cambrian Archæological Association began on Monday at Denbigh, when a museum containing Welsh relics and valuable articles of historic interest, one of the finest collections ever witnessed in the Principality, was opened at the County Hall. Major C. S. Mainwaring, the president for the year, gave the opening address. On Tuesday excursions were made to the ruins of Denbigh Castle, the Burgeos tower and walls, the ancient church of St. Hilary, and Leicester Church. Drives were also made to Whitchurch Abbey, Llandyrnog Church, and Penycloddian Camp, after which papers were read on Welsh hut-dwellings and other subjects. Lieutenant-Colonel Mainwaring presided, and Mr. Stephen Williams, architect, of Rhyadyz, gave an interesting account of his recent explorations at Strata Florida Abbey. The Rev. Trevor Owen, the general secretary, in presenting his report, said that at the last annual meeting a small grant was made to Mr. Stephen Williams, of Rhayader, to trace out the ground plan of the abbey church at Strata Florida, and the results of his explorations had already been so encouraging that it was proposed that the association should undertake the entire clearing out of this, the greatest abbey in Wales. Bodfari church and camp, Caegwyn and Ffynon Beuno caves, Tremeirchion Church, St. Beuno's College, Dyserth Castle and church, and Rhuddlan Castle, the Priory, and Church, were visited on Wednesday.

Midland Institute, Archæological Section.—The last excursion of the season was arranged for Saturday afternoon, and thirty-four members and friends proceeded to Kingswood Station for a walk to some of the famous but unfamiliar archæological attractions of the neighbourhood. The ancient and picturesque moated fortance of Baddesley Clinton, the home of the Ferrers family for many generations, and a fine example of a house of the fourteenth-century, with many of the marks of later days, leaving much of the old work unchanged, was first visited. The party was received by Mr. and Mrs. Dering and conducted through the rooms and galleries of the moated mansion, crowded with fine old paintings, china, and other works of art of great interest and value. The armorial shields of the Ferrers family, the old portraits, the ancient shovelboard, and the family chapel were examined with care. Every room and corridor had some curious memorials, books, pictures, old tapestries, antiquities from Italy, &c. A short stroll led to the old Baddesley Church, where many generations of the Ferrers family repose in peace, and whose tower was built by Nicholas Brome as a penance, and the party went on to Wrayhall Priory and Hall. The Priory was once the property of the Wren family, and the mansion was built and occupied for some years by the famous surveyor of St. Paul's Cathedral. The ruins were extensive and interesting, and some of the old walls still remain to mark the sites of the various buildings. The church itself was "restored" some years ago by the present owner, and the glass has been preserved ; but the venerable look of the old fabric has been lost. On the walls of the dining-room of the hall are examples of art by Ary Scheffer, Webster, Cox, Linnell, Nasmyth, Eastlake, &c. Another walk across fields led to the Shakespeare House at Rowington, where tradition asserts that the poet wrote some of his plays, and which, at any rate, was found to be a very picturesque half-timbered house of the fifteenth century, and a visit to Rowington Church closed the proceedings.

The Sydney Institute of Architects.—A meeting of the Institute of Architects of Sydney, N.S.W., was held at their rooms on the 7th July, when the following gentlemen were elected Fellows:—Messrs. W. W. Wardle, J. S. Edwards, G. A. Mansfield, J. Sulman, A. Blacket, W. L. Vernon, J. E. Kemp, J. J. Sheering, E. H. Buchanan, J. F. Hennessy, H. S. Thompson, J. E. Holland, R. E. Holland, R. C. Backhouse, J. B. Holson, and G. A. Morrell. The Hon. Secretary, Mr. T. Fletcher Watson, presented the report and balance-sheet, both of which were highly satisfactory. Mr. Thomas Rowe, F.R.I.B.A., was appointed President for the ensuing year. The annual dinner of the Fellows of the Institute took place at Günsler's Café the same evening, when about forty gentlemen sat down. The chair was occupied by the President of the Institute (Mr. Thomas Rowe), and amongst those present were Sir Edward Strickland, K.C.B., Mr. Edward Combes, C.M.G., Professor Anderson Stuart, Mr. E. Du Faur, Mr. J. R. Ashton, Major Parrott, Mr. T. E. Rivers, Mr. P. Fletcher Watson, Mr. W. Gardner, Mr. W. Kenwood, Mr. W. Martin, and Mr. E. J. Jackson. Mr. G. A. Mansfield, in proposing "The President of the Institute," alluded to the services which Mr. Rowe had rendered to the Institute and the profession during the past sixteen years. Their members had been engaged for some years past in the work of rebuilding the metropolis of New South Wales, and there could be no doubt that the work being done to-day would make its mark upon Sydney for all time. The President, in responding, referred to the difficulties which he and others had experienced in the formation of the Institute, and to the hard struggles which had taken place before it was raised to its present honourable position. He alluded to the great alterations which had taken place in the city during recent years, and that in 1886 there were 510 new buildings erected and in the course of erection, whilst for the first half of the present year (1887) the number of new buildings erected and in course of erection was 365. Very numerous alterations, additions, &c., are also being made. The foregoing new buildings include two theatres, three arcades, nine hotels, two public halls, public baths, and several large offices, stores, and dwellings. Sir Edward Strickland, K.C.B., proposed "The Engineering Association," which was responded to by Major Parrott. Mr. J. Sulman submitted the toast of "Art." In the course of an excellent speech he said that in leaving England for the colony he thought he would, most probably, leave all art behind; but much to his pleasure and surprise he found art well represented, some of the men in their own department of it doing excellent work. He also dwelt at some length upon the probable future of the arts in these southern lands. With their lovely climate and splendid surroundings they had a future before them which he believed they might make as glorious as that of Italy. He coupled the names of Messrs. Combes and Du Faur with the sentiment. Both gentlemen replied, as did also Mr. Julian R. Aston as President of the Art Society, N.S.W. "Science" was proposed by Sir Edward Strickland, and was acknowledged by Professor Anderson.

ARCHÆOLOGICAL.

Roman Remains at Kirkintilloch.—In the summer of 1879 a section of the Roman vallum of Lollius Urbicus, erected by him between the Firths of Forth and Clyde, was laid bare by the excavations in connection with a sand-pit at Bellfield, and a number of human bones were unearthed. For some time past Mr. Thomas Ferguson, sand merchant, Kirkintilloch, has been cutting into the ridge on Westermains, along which the Roman wall and military way are known to have been constructed. On Thursday the workmen came upon a chamber in the earth, in which were found some bones and a bronze spear-head. Cutting, at right angles, into this sand ridge, which some believe to be the southern shore of what was once a great inland sea, running from the Forth to the Clyde, the workmen have exposed a section of the wall and military way, formed of large-sized gravel and freestone rubble. The angle of declivity of the wall towards the fosse is perfect in outline, and the disturbance of the sand strata in the formation of the ditch, wall, and military way is strikingly apparent. Close by the military way, and at a depth of about 6ft., was found the chamber already referred to. It was about 6 or 7ft. long, 2ft. broad, and about the same in depth. The spear-head, when entire, was about 8in. long. The point is missing, but the remaining 6½in. are in a fair state of preservation. It is 2½in. broad at the head, and the thin, sharp blade is strengthened by a narrow band of thicker metal running down the centre of each side, and tapering, like the blade, from head to point.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—A. C. and Co.—J. K. and Co.—H. and Co.—W. W. and Son.—G. W. Ry. Co.—H. and G.

Correspondence.

THE ARCHITECTURAL ASSOCIATION EXCURSION.

To the Editor of the BUILDING NEWS

SIR,—Permit me a few words in respect to the paragraph relating to Allen and Wood in your description of the Architectural Association excursion.

Allen, of course, needs no apology from me—every literate person knows of his deserved position amongst the great men of his time, and, moreover, from the reference to him as "the stone quarry owner who erected Prior Park as an advertisement for Bath stone," I conceive that the notice is written in a kind of humour, though I am not able to appreciate the jest.

But I should be sorry to think that an artist of such great ability as Wood displayed should be referred to in your paper as if he were merely a commercial architect with a turn for advertisement.

Wood was a man of unusual breadth of mind and grasp of the salient conditions given him: he could design not merely a house, but a street—a city.

To few has been given to lay out a town, and but few of those have risen to such a task—Wood used his chances to the full. In all England there is no city comparable to Bath for beauty and grave dignity; and for this it owes little to its locality.

Built in a valley that is wide, but not impressive, and fed by a sluggish and muddy river; and on the hills that rise steeply on all sides, but without grandeur, compelling the fatigues of long stiff ascents without the reward of fine outlines or noble shapes, Wood planted the hillside town with such appreciation of site and such power of concerted arrangement that the main, and almost the first obvious characteristic of Bath is its noble dignity and the simple beauty got from great breadth of design and the direct co-operation of mass helping its fellow mass.

And this, too, is done in a style essentially stubborn, yet under Wood's hand it melts and bends till there is no limit to its capacities. The genius that laid out Pulteney-street, with its perfect proportion and imperial regularity, with its perspective fittingly connected with the block of Sidney College terminating the vista, could plant Queen-square in sunny quiet, and drive thence Gay-street up an almost impossible slope, to reach the elaborated charm of the Circus, had the scenic and comprehensive qualities of mind that should give him a place beside Michael Angelo, Palladio, and Wren. I could wish your critic to give another and a longer look to Prior Park (a really noble building), and then, if he would not grudge the toil, climb to Camden-crescent, and look at the perfect way "the dismal piece of building" is made to ride on its hillside, and he will grant, I think, that such a site and such a building were incapable of being conjoined with beauty and fitness, and yet that Wood has undertaken this problem, and answers it with complete success. I did not know that Wood had written a book, "The Beauties of Bath"—he created them.—I am, &c., HALSEY RICARDO.

THE IMPERIAL INSTITUTE.

SIR,—As I read, the Imperial Institute design is modified and settled upon by, or with the aid of, H.R.H. the Prince of Wales and Sir F. Abell, I wish you could and would enlighten those who take an interest in the subject what the improvements are to be, as I am afraid the glorious opportunity of a second noble dome in London is passing away, as also the smaller domes or cupolas contemplated for the Admiralty Offices and Liverpool Cathedral, not so much for lack of means as want of admiration; as the comparative expense of what I venture to call the tower treatment does not seem so considerable in a large structure to—Yours, &c.,

JAS. PULHAM.

SCOTTISH ARCHÆOLOGY.

SIR,—I beg to thank you for inserting my letter in your issue of the 5th inst., and Mr. Reid for endorsing it by his note published on the 12th. I feel convinced that little progress can be made in Scottish archæology unless the society in Edinburgh can be induced to descend from the scientific throne it has usurped, and on which it sits with such an air of intolerable arrogance and self-assumption, and modestly assist those who go into the field and do the real work, or unless it can be persuaded to disband and leave the course open to all competitors. At present its very existence handicaps outsiders. Living itself in an element of sham and humbug, it does its best to embarrass and discourage earnest inquirers. This is not a question affecting Scotland alone, for the three kingdoms are so related that the light thrown upon one illuminates all. For this reason I trust Englishmen will feel some interest in the subject, and that you will once again be able to spare me a little of your precious space to call their attention to it.—I am, &c.,

J. SANDS.

Vadlure, Walls, Shetland, Aug. 20.

THE "PLAN OF CAMPAIGN" FOR THE ARCHITECTURAL STUDENT.

SIR,—The architectural pupil invariably commences his career with a singular indifference to the great mass of work that lies between him and success in his profession; he might well discover a mine of revelation in the contemplation of the energy and patient labour of the efficient architect. At present he has seen little beauty in his future goddess; Solomon on wisdom, knowledge, and wasted opportunities is as yet an undigested textbook: when so much that is venerable has failed, it is not desirable that smaller men should "rush in"; but there are still fortunately those to whom the engineering of a future career is of deep and serious import; to whom it is a serious matter that efficiency should be accomplished within a reasonable number of years.

How many of these, alas! of the most earnest set forth full of energy without a definite plan to plunge into the indefinite maze of architectural studies, often to find themselves wearied out at the end of years of hard work because so much energy has been misplaced and their efforts spread over too wide a field, as though they had sown the good seed of labour in patches over a wide area which at harvest time they could not find and reap. It is impossible, then, to over-estimate the value of such help as is offered by the lately-instituted committee of advice of the London Architectural Association—for here the "plan of campaign" may be fully discussed by men who have themselves trodden the path. A moment's glance at the subjects for architectural study will convince us that they are so wide and varied that only careful economy of time can facilitate a reasonable proficiency in the important branches.

First and foremost comes the making of drawings for client and contractor; next, constructional knowledge of all building trades, strength of materials, sanitary science, shoring and drainage. Then the making of specifications, method of estimating cost; following on with the history of architecture, the study of style, and an intimate acquaintance with one style, and, finally, what is known as professional practice, under which head are required knowledge relating to contracts, light and air, surveys, dilapidations, valuations, and Building Acts. The study of perspective and colour decoration must not be omitted.

Undoubtedly, the best method of attempting this mass of work is to master each subject almost by itself with perfect thoroughness, taking care that what has once been studied is reduced to clear, concise notes to make up a text book for future review. Let us suppose a plan of work for a model pupil articled for three years, and a member of the Architectural Association. For the first year, then, he should certainly be engaged in the copying of drawings, and making of studiously accurate tracings, in thoroughly examining works in progress, and studying the first and second volumes of Rivington's "Building Construction." With regard to the study of books, one good book on the subject should be selected under good advice, and epitomised, reduced to short but full crisp notes; these may be carefully copied out, and form the basis of study and review, and a separate book kept for future notes on this subject. In the second year he would take up the elementary class of design, and the lectures in connection therewith; should take part in the duties of his office, and study the third volume of Rivington's "Building Construction." In the third year he should be thoroughly useful in his employer's office, should work on the higher grade of the elementary class of design, attend the class of construction, and also the lectures of that class. The "notes" taken at these classes and lectures should be entered in their respective permanent note-books.

In the fourth year he should seek employment as an improver, and devote his spare time to sketching old examples, to the class of design, and the study of the history of architecture, and in this last subject care should be taken to choose a textbook of reasonable dimension, such as those by Professor Roger Smith; and then an intimate knowledge of one style should be gained by the aid of larger works. In the fifth year the student could take specifications, nature of contracts, and the method of estimating.

If our model pupil be not in London he would, of course, require a different programme, and the whole of his work might be embraced as follows:—During the first year he should learn to trace accurately, and to copy drawings; he should study the first and second volumes of Rivington's "Building Construction," the copying of old architectural examples from drawings or their enlargements from books, and endeavour to see as much as possible of work in progress.

In the second year he should take an earnest part in the office work, study the third volume of Rivington's "Building Construction," and commence to design simple things; he would also do well to join the BUILDING NEWS Designing Club.

In the third year he should devote himself to design and the sketching of old examples.

In the fourth year he should continue the

same course, and add to it the study of the "History of Architecture," with an intimate study of the style in which he is designing.

In the fifth year the study of specifications could be taken with the study of contracts, methods of estimating, &c. In this way, supposing our pupil to have been seventeen years of age at the commencement of his articles, he would still have three years to review and perfect his work, to study shoring and drainage, to enter for travelling studentships before entering for examination at the age of 25. By hard work he would have acquired the habit of rapidly digesting the other studies required of him at any age when, alas! many architectural students are beginning to contemplate seriously the work that lies before them. One very common error it is very necessary to avoid: when too much work is undertaken, the work suffers in quality what it gains in quantity; the programme had much better be lengthened out than the work hurried over, for architectural work badly done will inevitably have to be done again.

To sum up, then, the points of the greatest importance in architectural study, there should be a thoroughly definite, well considered plan of action; there should be the reduction of the main features of the studies to such a form as will render them easy of review, then such a regard for thoroughness as will free us from the consciousness of haziness in any subject once studied; and, lastly, such a periodical review of our work as will enable us to retain what we have once grasped.

It is a matter of great congratulation that the work of the architectural student is rendered day by day less difficult—his task will never probably be light; but, thanks to the patient care of a thousand lovers of our art, most of the thorns have been removed from what should certainly be a path of roses to the true student of architecture.—I am, &c.,

CHRISTOPHER M. SHINER.

A CORRECTION.

SIR,—I notice in the BUILDING NEWS of the 19th inst., on page 304, a paragraph headed "Chips," stating that "Mr. Willis Wigg, of Lynn, has been elected assistant surveyor to the York City Council with a salary of £180 a year."

This statement is incorrect in two particulars—viz., 1st, Mr. Wigg is not assistant surveyor to the York City Council, but third assistant in this office; 2nd, his salary is £80, not £180 per annum.

I may say that when Mr. Mawbey commenced his duties as city surveyor here, he divided the office, appointing Mr. Dickenson chief assistant of the surveyor's department, and myself chief assistant of the engineering department; this arrangement is still in operation, and Mr. Wigg will consequently be an assistant under me.

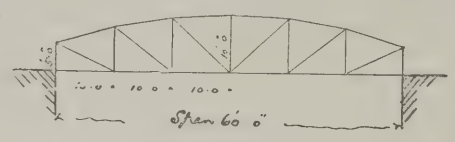
You will greatly oblige by inserting this letter (with the contents of which Mr. Mawbey is fully cognisant) in the next issue of your valuable journal.—I am, &c., H. C. CRUMMACK.

City Surveyor's Office, Guildhall, York, Aug. 23.

[The paragraph was taken from a Stamford paper, and is in all probability the result of some printer's error. Mr. Wigg did not send it, and is in no way responsible for the error.—ED. "B. N."]

A work which will become memorable in the history of the church of St. George at Stamford was begun last week—the addition of transepts. The present wooden gallery, which occupies the sides, and the west end of the nave will be pulled down and removed. The aisles are to be lengthened to within a few inches of the western face of the tower, an alteration which will materially alter the appearance of that feature. When all is done, accommodation for about 30 additional people will be gained, after making room for the displaced seats of the gallery. Mr. Hilliam is doing the stonework, and Mr. Wyles, also of Stamford, the woodwork.

One of the ornamental fountains which the English Waterworks Company at Antwerp has presented to the town was unveiled on Monday in the presence of the local authorities. It has been erected on the Grande Place, is the work of the Belgian sculptor, Jef Lambeaux, and represents the history of Antigonus. Part of the cost has been met out of Baron Nottebohm's legacy for the embellishment of the public squares at Antwerp.



An oak reredos, the work of Messrs. Cox, Son, Buckley, and Co., of Southampton-street, Strand, W.C., has been placed in the chancel of St. Giles's Church, Newcastle-under-Lyme. It is Early Decorated in style, and cost £300. Messrs. Chapman and Snape, of Newcastle, were the architects.

Intercommunication.

QUESTIONS.

[9375.]—**Tall Column or Chimney Shaft.**—What book will give me method of working out the stability of a column like the Monument in King William-street, or Nelson's Column, Trafalgar-square, or a very high chimney-shaft?—J. CHURCHILL.

[9376.]—**Girder Strains.**—I should be much obliged if someone well acquainted with the subject would give me their opinion as to the amount of strain on the members of the truss below. Live load = 1 ton per ft.; dead

load = ½ ton per foot.; radius of top member = 90ft.—R. B.

[9377.]—**Dimensions of English Cathedrals.**—Great diversity appears in the statements of length and other dimensions of cathedrals. The question as to which is the longest cathedral is still scarcely a settled point. St. Alban's is now considered to be the longest church in England, being a few feet longer than Winchester. Ely and Canterbury follow in order; but what I desire more are the general dimensions of nave, aisles, transepts, presbyteries, &c., in the following order: Length of nave (internal) from western door to transept, width of nave, width of aisles, height of both, transepts, length and width; choir length and width, presbytery length and width, also of processional paths, heights, &c. I find on looking through the published lists for instance that one authority, Walcott, gives the length of Canterbury as 517ft., and another puts it down at 524ft.—G.

[9378.]—**Salisbury and Exeter.**—Can any of your readers inform me what objects of architectural interest there are in the neighbourhoods of Salisbury and Exeter?—T. C.

REPLIES.

[9310.]—**Half-Timbered Walls.**—If "Jack Mortise" and "G. H. G." will fully illustrate (either by sections or diagrams) what they term "timbers well framed," and show the connection between the wood and the brick filling-in, &c., and the connection of both with the inner wall, I will show that they are only contending for a distinction without a difference.—JAMES THORNELOE.

[9333.]—**Ventilation and Prevention of Down-draught in Churches.**—Relative to the correspondence in the columns of the BUILDING NEWS respecting the heating of churches and large buildings, I have heard it asserted frequently that there is considerably more danger in the use of the high-pressure small-bore pipe system than in that of the larger bore. The advantages of the small bore are considerable, especially in old buildings, where they can be so easily adapted to existing conditions. Moreover, the first cost is less, and heat can be generated more quickly and with much less fuel. I had several buildings heated with this small-bore system, and though on the whole I regard it as satisfactory, I have felt the air at times over hot and oppressive. This no doubt might have been, under more skilled hands, corrected by better management on the stoker's part; but I confess I like the sensation of the milder heat created by the larger pipes under the old boiler system better. Probably some of your readers of greater experience would say something as to the comparative safety and merits of the small bore, especially after a few years' wear, and if, on the whole, it is more satisfactory. After this exceptionally dry and hot summer we may have a very wet and cold winter, and this is a good time to keep the question aired. It is claimed as one of the great advantages of the small-bore system that coils can be so easily run through the roofs without being an eyesore, and thereby warming the air and preventing down-draughts of cold air. References might also be made to buildings satisfactorily treated for heating and ventilation.—RUSTICUS.

[9348.]—**Boundary Line.**—"G. H. G." is in error when he states "the centre of the hedge where there is no ditch is presumably a boundary." The hedge belongs to the owner of the land on one side or other, and must stand on his land, and the rule is, where no ditch, to allow one foot from or beyond the centre of hedge, as a hedge, when properly trimmed, is supposed to occupy 2ft. of space. There was no difficulty fifty years ago on these points—old surveyors were thoroughly acquainted with the practice; but now surveying is taken up by anyone, there are never-ending disputes.—Z.

[9354.]—**Gothic.**—"Student" will do well to study "Paley" carefully; but if he has not already read them he had better go through Parker's "A. B. C. of Gothic Architecture" and "Introduction to Gothic Architecture" first.—A. GOTH.

[9356.]—**Wood Staining.**—I found by experience the other day the proper way is to stain first and then twice size and varnish. If the wood is sized first, the stain does not enter the pores, and it turns green in parts, in fact, is no good whatever. I trust to see the rest of the question answered by another practically experienced.—WILLIAM WAGHORNE.

[9365.]—**Adjustable W.C.s.**—If "T." will write to me, I can supply him with a plan I have designed to meet the above want.—W. LENLEY, Surveyor, 158, Strand, W.C.

The adjudications in bankruptcy announced in Friday's *Gazette* include the names of James Ford (trading as James Ford and Co.), Pitfield-street, Hoxton, and Carteret-street, Westminster, contractor; Geo. Broom, Hoxton and Kingsland, timber merchant; and Charles Huxley, Wrexham, builder.

LEGAL INTELLIGENCE.

A WELSH SLATE QUARRY LITIGATION.—An arbitration suit, in which the Welsh Slate Quarry Company were sued by Mr. W. E. Oakley for the recovery of damages originally laid at a quarter of a million, for not working the quarries according to the terms of the lease, by taking out unfairly the "eye" of the quarry, and leaving the unworkable material, has been decided by Mr. Gully, Q.C., who sat as arbitrator, against the company. The damages are assessed at £90,000, and the costs, it is expected, will reach about £30,000. Nearly every quarry proprietor and manager in North Wales was examined, the arbitration, which took place in London, occupying several months.

IN RE CUMING AND BARNETT.—A CAUTION TO SPECULATING BUILDERS.—The bankrupts, who were builders and contractors, of Westminster-chambers, Victoria-street, and Homerton Bridge, recently applied for their discharge; and Mr. Registrar Lankaster gave judgment on Tuesday. The failure occurred in December, 1885, the liabilities being returned at £4,652; and the trustee, in his report, dated the 18th ult., certified that nothing had then been realised from the assets, and that it was uncertain whether there was any value attaching to the equities of redemption of the mortgaged properties. His Honour said that the bankrupts, after the experience of a previous failure, commenced business as speculative builders about five years prior to the date of the receiving order. Although they had only a capital of £200, they engaged in very extensive operations, and mortgaged the property from time to time to a capitalist who had assisted them with advances. They had, in the words of the late Lord Justice James, "played the game the chief principle of which is 'Heads, I win; tails, you lose.'" Not only was their course of business rash and hazardous, but, in the language of the late Lord Westbury, it was positively dangerous. They had in the course of their speculations contracted debts to a large amount without reasonable or probable expectation of payment, and had continued to trade with knowledge of insolvency. They had also committed other offences, and the discharge must be suspended for a period of five years.

CHIPS.

On Sunday week the first service was held in the Chapel-of-Ease at Birchwood, two miles from Buckland St. Mary, Devon. The chapel is built of native stone, with Beer-stone dressings, and is lined with red brick. The windows are of the lancet type, with stained glass. The builder was Mr. E. J. Symes, of Coombe St. Nicholas, who followed his own designs, and the cost was about £300.

A vestry and mission room have just been added to St. Mark's Church, Battersea, from the designs of the architect of the church, Mr. William White, F.S.A., of Wimpole-street, W.

Bampton Church, Devon, was reopened after restoration on Sunday. The works completed include reopening of south porch, which had been closed for twenty years; removal of west gallery, and renewal of seating.

The new cemetery for the parishioners of New Shoreham, Sussex, was opened on Thursday last, the ceremony of consecrating a small portion of it by the Bishop of the Diocese taking place at the same time. In shape, the ground is like a leg of mutton or a pear, and is inclosed with hedges and a wrought-iron fence. At the entrance is a solid-looking lodge and oak lych-gate, both covered with red tiles, and with walls of red kiln bricks, and panels of large flints in random work. Mr. Arthur Loader, of 54, Old Steine, Brighton, was the architect.

On Saturday, the 13th of August, the Crown Princess of Germany, with Sir Henry and Lady Ponsonby and others, visited Sir J. Chas. Robinson at Swanage. The party, on arrival from Cowes, drove through Durlston Park to Durlston Head, where they inspected the pavilion designed by Mr. Reginald Pinder, F.R.I.B.A., and other works now being carried out there by Mr. George Burt, J.P. (ex-sheriff of London), of Purbeck House, Swanage, to whom the property belongs. The Princess afterwards visited the caves at Tilly Whim, which are close by.

Mr. H. T. Margetson, of Chelsea, has been commissioned to execute the carving of the new town-hall, Portsmouth. Mr. W. Hill, of Leeds, is the architect of the building, which has been illustrated in our pages.

St. Lawrence's Church, Chorlton, Staffs, was reopened last week after restoration from plans by Mr. Charles Lynam, of Stoke-on-Trent. The altar, pulpit, and prayer-desk of 1827 have been replaced by new fittings from the architect's designs, the oak pews have been converted into open sittings, and the passages have been laid with tiles supplied by Messrs. Minton, Hollins and Co., of Stoke.

PARLIAMENTARY NOTES.
